Bill Introduced.—H. 255 proposes certain amendments to the law regulating the practice of **osteopathy.** Among other things the term "osteopathy" throughout the act is changed to read "osteopathic medicine and surgery," the osteopathic board is required to examine applicants in bacteriology, pharmacology and materia medica, and surgery with instruments, in addition to other subjects, and licentiates of the osteopathic examining board would be granted the right to use or apply any therapy or modality calculated to assist or aid a body injured or afflicted with physical or mental infirmities in effecting its own cure or the use or application of such agencies in restoring the normal condition of the body, including, but not by way of limitation, surgery with instruments and medicinal substances when indicated.

Maryland

Bills Introduced.—H. 460 proposes the creation of a **state board of naturopathic examiners** and defines naturopathy. S. 329, to amend the law relating to the practice of medicine, proposes that applicants for a license who **graduated from a college in a foreign country,** the entrance requirements, standard of education and requirements for graduation of which are equivalent to the standard defined by the Association of American Medical Colleges or the Inter-collegiate Committee of the American Institute of Homeopathy may be admitted to the examination. S. 331 proposes that **one student from each county** and legislative district of Baltimore City who shall comply with the entrance requirements shall be educated free of charge for tuition and laboratory fees by the Medical School of the University of Maryland and shall be paid the sum of $500 per year toward living expenses. Before accepting such scholarship, however, applicants must sign a pledge in writing that they will practice medicine for two years in the county or city from which they are appointed.

Minnesota

Bills Introduced.—H. 1090 proposes to make it unlawful for any female human being to submit to the act or operation of **artificial insemination** or for any person to perform the act or operation of artificial insemination upon any female human being or to assist, aid or abet any person in the performance of such act or operation, or to donate, contribute or collect semen therefor. A child born by means of artificial insemination where the husband has expressly or impliedly consented thereto, however, shall be deemed legitimate. H. 1092 proposes to authorize a married woman to submit to the act or operation of **artificial insemination** when the husband of such woman has consented, when the woman certifies in writing that she is voluntarily submitting thereto, when the physician performing the act has made a thorough and complete physical and mental examination and found (a) that conception by sexual intercourse is improbable; (b) that the woman is not afflicted with syphilis or with any disease that might be communicated to a child; (c) that both husband and wife have sufficient mental and emotional stability to indicate that the welfare of each and the child would not be adversely affected; (d) that the donor is not afflicted with syphilis or any disease that might be communicated to the child; (e) that the blood of the donor and donee is compatible, and (f) that the donor (when not the husband) resembles the husband in physique, appearance and temperament and is of the same race. H. 1300 proposes to permit the state department of health to suspend or **revoke a hospital's license** for refusal by the hospital to admit any person in medical extremity and in need of emergency care solely for the reason that the licensed physician in attendance is not a regular member of the hospital staff, if facilities are then available. S. 831 proposes to authorize the state live stock sanitary board to license institutions desiring to obtain **impounded animals** for purposes of scientific investigation.

New Hampshire

Bill Introduced.—H. 480 proposes the creation of a commission for the study, treatment and care of inebriates which shall be known as the **commission on alcoholics.** This commission would study alcoholism and its problems, including methods and facilities available for care, custody, detention, treatment, employment and rehabilitation of persons who are inebriates.

Tennessee

Bills Introduced.—H. 865 proposes certain amendments to the **workmen's compensation act** among which is the provision that an employer shall designate a group of three or more reputable physicians or surgeons from which an injured employee shall have the privilege of selecting the operating surgeon or attending physician. S. 475 proposes the creation of a state **board for licensing clinical laboratory technologists** and defines a clinical laboratory technologist as a person who engages in the work and direction of a clinical laboratory. A clinical laboratory technician is defined to mean a person other than a physician and surgeon who, under the direction of a clinical laboratory technologist or a physician and surgeon performs the technical procedure called for in a clinical laboratory.

Texas

Bills Introduced.—H. 416 proposes to declare it to be a monopoly, and contrary to public policy, for any two or more persons, physicians or hospitals to prevent any other licensed physician from visiting patients in such hospitals or performing operations or giving medical attention therein, from refusing admittance to any hospital of any person licensed to practice medicine in the state, from refusing to permit patients in the hospital the right to the services of a doctor of their own choice, and from entering into any agreement to remit, **split fees** or revenues or make what is known in the trade as **cut-backs.** H. 499 proposes the enactment of a **hospital licensing law.** H. 517 proposes to prohibit the acceptance of **any type of rebates** by persons engaged in any licensed occupation or profession within the state.

West Virginia

Bill Enacted.—H. 134 was approved Feb. 26, 1949. It makes general amendments to the medical practice act, including the creation of a **medical licensing board** and the right to make use of the injunctive process to enforce the provisions of the act.

Wisconsin

Bills Introduced.—A. 334 proposes that no person shall perform any medical, surgical or chemical investigation, experiment or demonstration **on any living dog or cat.** A. 407 proposes that a child born to a married woman by means of **artificial insemination** with the consent of her husband shall be deemed the legitimate, natural child of both the husband and his wife for all purposes. S. 358 proposes the enactment of a **hospital licensing law.**

GOVERNMENT SERVICES

ARMY

NEW POLICY CONCERNING RESERVE COMMISSIONS

With the approval of the Advisory Council of Medical Consultants of World War II, the Surgeon General announced March 7 the policy of the Medical Department in regard to grade on recall and assignment of reserve officers. It was stated that in recognition of obligations assumed by these officers in accepting reserve and National Guard commissions they should receive priorities over officers newly appointed from civilian life when both have equal professional qualifications. It will be the policy in giving final approval of the grades to which civilian personnel are to be commissioned in the Medical Department because of a national emergency to take consideration of the fact that many of these civilians have not had military experience and have not taken part in the reserve and National Guard programs. The Advisory Council, which is a special committee of the Society of Medical Consultants of World War II, unanimously endorsed these policies.

NEW REGULAR MEDICAL OFFICERS

The following physicians have recently been commissioned in the Regular Army Medical Corps:

Rank	Name	Address
First Lieut.	Archibald M. Ahern	Webster Grove, Mo.
First Lieut.	John C. Baber Jr.	Little Rock, Ark.
First Lieut.	Dexter T. Ball	Santa Ana, Calif.
First Lieut.	Hugh M. Cardullo	Brooklyn
Major	Jeremiah A. Dailey	Madison, N. J.
First Lieut.	John A. Duggan	New York
Capt.	Robert O. Emmett	Lake Charles, La.
Major	Gordon F. Fisher	Corpus Christi, Texas
First Lieut.	William A. Graber	Chicago
First Lieut.	William Hausman	Worcester, Mass.
Capt.	Delbert W. Hess	Tucson, Ariz.
Major	Charles W. Hoffman Jr.	Baltimore
First Lieut.	Rudolph M. Jarvi	Detroit
First Lieut.	Richard G. Johnson	Louisville, Ky.
First Lieut.	Arthur E. H. Knox	New York
First Lieut.	Franklin M. Lockwood	Kansas City, Mo.
First Lieut.	David N. Marine	Rehoboth Beach, Del.
First Lieut.	Elwin W. Midgley	Union, N. Y.
First Lieut.	Arthur J. Moseley	Augusta, Ga.
First Lieut.	Joseph G. Murphy	Taunton, Mass.
First Lieut.	Merrill F. Nelson	Alexandria, Va.
First Lieut.	Robert E. L. Nesbitt Jr.	Baltimore
First Lieut.	Lester L. Nienhuis	Ann Arbor, Mich.
Capt.	Max W. Pegram	Tupelo, Miss.
First Lieut.	George W. Pogson	Pittsburg, Kan.
First Lieut.	Irvin L. Schweitzer	Naperville, Ill.
First Lieut.	George W. Shannon	Washington, D. C.
First Lieut.	Leon Stutzman	Baltimore
First Lieut.	Gilbert A. Varnell	Cleveland, Tenn.
Capt.	John W. White	Washington, D. C.
First Lieut.	Forrest J. Woodman Jr.	Peoria, Ill.

MEDICAL CONFERENCE IN TOKYO

At a medical conference at the 361st Station Hospital in Tokyo, Japan, February 23, among the speakers were the following consultants from the United States: Drs. Verne R. Mason (internal medicine), Los Angeles; Byron Smith (ophthalmology), New York, and A. A. Liebow (pathology), New Haven, Conn. Lieut. Col. C. F. Tessemer, M.C., spoke on "Studies Concerning Atomic Bomb Casualties"; Capt. W. R. Gabbert on "Psychosomatic Problems from the Internists Viewpoint"; Capt. M. Reisch on "Basic Principles and Treatment in Dermatology"; Lieut. A. L. Cohen on "Diagnosis of Common Skin Disorders"; Captains R. S. Johnson and J. A. Pennington on "Tuberculosis Among Japanese War Criminals"; E. A. White, Ph.D., on "Problems in Toxicology," and D. B. McMullen, Sc.D., on "Animal and Bird Schistosomiasis." A buffet supper and dance was held at the Officers' Club after the meeting.

OFFICERS ACCEPTED FOR ADVANCED TRAINING

The following Medical Department officers have been accepted for advanced training by the civilian schools and hospitals indicated:

Name	Institution	Subject
Col. Henry S. Murphey	University of Colorado Medical School, Denver	Poliomyelitis
Lieut. Col. Augustus A. Hall	University of Colorado Medical School, Denver	Poliomyelitis
Lieut. Col. James E. Tate	University of Colorado Medical School, Denver	Poliomyelitis
Lieut. Col. Albert W. Shiflet	St. Louis University School of Medicine, St. Louis	Orthopedic surgery
Lieut. Col. George H. McShatko	Shriners Hospital for Crippled Children, San Francisco	Children's orthopedics
Lieut. Col. Martin A. Compton	Medical College of Virginia, School of Medicine, Richmond	Internal medicine
Major William S. Dandridge	University of Colorado Medical School, Denver	Poliomyelitis
Capt. Harry M. Henderson Jr.	University of Colorado Medical School, Denver	Poliomyelitis
First Lieut. Morton C. Creditor	Goldwater Memorial Hospital, Welfare Island, New York	Internal medicine
First Lieut. John W. Frye	Columbia Hospital, Milwaukee	Surgery
First Lieut. Samuel W. Hunter	University Hospitals, University of Minnesota, Minneapolis	Surgery

MEETING OF NEUROPSYCHIATRIC CONSULTANTS

The Neuropsychiatric Consultants of World War II held their fourth annual meeting February 23-24 in the Office of the Surgeon General, the Pentagon, Washington, D. C., to consider problems in neuropsychiatry and to make recommendations. Chairman of the meeting was former Brigadier General William C. Menninger, now clinical director of the Menninger Foundation, Topeka, Kan., and president of the American Psychiatric Association. Among the recommendations made were methods and procedures to liberalize ways and means by which reserve medical officers may earn point credits toward promotions; the promotion of first lieutenants, Medical Corps, to temporary grade of captain after completion of one year on active duty as an aid to procurement of physicians, and the imperative need for research in the field of preventive psychiatry and human resources. This group of forty consultants (psychiatrists and neurologists) represents all sections of the country.

AIR FORCE

COURSE IN AVIATION PHYSIOLOGY TO PROVIDE INSTRUCTORS

An aviation physiology course will open May 2 at the School of Aviation Medicine, Randolph Field, Texas. An increasing demand for the study and understanding of human physiologic tolerances and capabilities in aviation has created the need for instructors in these subjects. The pilots chosen for the instructors' course will be offered opportunities for further education in physiologic research and future assignments with the Aeromedical Laboratory at Wright Field, Dayton, Ohio, or at the School of Aviation Medicine, Randolph Field, Texas. Twenty pilots will be selected for the ten week course.

PUBLIC HEALTH SERVICE

EXAMINATION FOR APPOINTMENT IN THE REGULAR CORPS

A competitive examination for appointment of medical officers to the regular corps of the U. S. Public Health Service will be held at various points throughout the United States May 3-5. The time for filing application for the examination has been extended to April 4. Application forms and further information may be obtained by writing to the Surgeon General, U. S. Public Health Service, Washington 25, D. C., attention: Division of Commissioned Officers. These appointments are permanent in nature and provide opportunities for a lifetime career in clinical medicine, research and public health at Marine hospitals and other Public Health Service facilities. Appointments will be made in the grades of assistant surgeon and senior assistant surgeon, for which entrance pay is, with allowance for dependents, $5,011 and $5,551. Provisions are made for promotion at regular intervals up to and including the grade of senior surgeon and for selection for promotion to the grade of medical director at $9,751 per annum. Applicants must be citizens of the United States, at least 21 years of age and graduates of a recognized medical school.

COURSE IN LABORATORY DIAGNOSIS OF RABIES

A course in the laboratory diagnosis of rabies will be offered April 25-29 at the laboratories of the Communicable Disease Center, 605 Volunteer Building, Atlanta 3, Ga. Although open to all grades of employed laboratory personnel, first consideration will be given to the laboratories of state and local public health departments and other official agencies responsible for the diagnosis of rabies. There is no tuition or laboratory fee, but travel and living expenses must be paid by the student. Application should be made as far in advance as possible. A list of hotels and rooming houses will be sent to applicants at the time of acceptance.

PROFESSOR WARBURG A SPECIAL RESEARCH FELLOW

Professor Otto H. Warburg, director, Kaiser-Wilhelm Institute for Cell Physiology in Berlin, is now serving a six month special research fellowship at the National Cancer Institutes, Bethesda, Md. He will conduct experiments on photosynthesis to determine the relation of carbon dioxide assimilation, as a synthetic process, to cancer. Dean Burk, biochemist at the Institutes, who will work with Professor Warburg, said that the proposed research amounts to studying cancer metabolism in reverse. Photosynthesis (the food-making process in plants) is the conversion of carbon dioxide and water into sugar and oxygen in the presence of chlorophyll and light; in cancer cells, as in all animal cells, sugar and oxygen are converted back into carbon dioxide and water. However, unlike normal animal cells, cancer cells metabolize very inefficiently because their oxidation is incomplete; that is, they do not convert all their sugar into carbon dioxide and water and therefore do not release as much energy from sugar as do normal cells. Professor Warburg contends that interference with the respiration in growing cells (e. g., interference with the oxidation of sugar) is, from the standpoint of the physiology of metabolism, the cause of tumors. Professor Warburg's greatest contribution to science to date was his discovery that all cancer cells, when breaking down sugar, produce great quantities of lactic acid, even in the presence of air. He was awarded the Nobel Prize in 1931 for his work on cell respiration, tumor metabolism and photosynthesis.

OUTBREAKS OF INFLUENZA

The Influenza Information Center at the National Institutes of Health, Bethesda, Md., has received reports of a number of outbreaks of influenza; however, no serious epidemic of influenza has appeared in the United States during the present winter. The isolation of three strains of influenza virus was reported from sporadic cases in the Pittsburgh area December 4, all of the A' group; 2 cases of influenza B were reported at Fort Sill, Okla., Dec. 30, 1948. The diagnosis was established by serologic tests; 4 cases of type B influenza were diagnosed among troops at Fort Ord, Calif., January 14; on January 17 an outbreak of type B influenza was reported in Seattle. Outbreaks in various foreign countries varying from a few cases to 500,000 in Italy were reported to the Influenza Center during January. The Italian outbreak was, at least in part, due to the type B virus, while an extensive outbreak in France affecting about 20 per cent of the population was, at least in half of the cases, caused by type A strain.

SECOND SYMPOSIUM ON ANTIBIOTICS

The National Institutes of Health will sponsor a second national symposium on antibiotic research April 11-12 in Washington, D. C., in the auditorium of the Department of Agriculture. Scientists who wish to attend this symposium or have original unpublished observations to present should communicate with Dr. Leonard Karel, Executive Secretary of the Antibiotic Study Section, National Institutes of Health, Bethesda, Md. The first national symposium on antibiotic research was held two years ago, when thirty-seven papers were presented providing the latest information on streptomycin, penicillin, bacitracin and other antibiotics.

PERSONAL

Dr. Ralph Gregg, who has been with the Public Health Service since 1929, has been appointed Assistant Chief of the Foreign Quarantine Division of the Public Health Service.

VETERANS ADMINISTRATION

RESIDENCIES IN NEUROPSYCHIATRY

Openings are available at this time for July 1 appointment to the Veterans Administration residency training program in neuropsychiatry. This program is under the jurisdiction of the deans of the Boston medical schools (Harvard, Tufts, Boston University), and the training, which may be from one to three years, is given at: Cushing Veterans Administration Hospital, Framingham, Mass.; Bedford Veterans Administration Hospital, Bedford, Mass.; The Mental Hygiene Clinic of Boston, Regional Office of Veterans Administration, Boston; West Roxbury Veterans Administration Hospital, West Roxbury, Mass., and the White River Junction Veterans Administration Hospital, White River Junction, Vt.

All stations are within commuting distance of the Boston Psychoanalytic Institute, in the event applicants have been accepted for analytic training. For information write to: Dr. J. L. Hoffman, Chief of Professional Services, Bedford Veterans Administration Hospital, Bedford, Mass., or to Dr. Wilfred Bloomberg, Chief of Neuropsychiatric Service, Cushing Veterans Administration Hospital, Framingham, Mass.

FEWER VETERANS ON DISABILITY ROLLS

The Veterans Administration announces that the number of World War II veterans on the disability compensation rolls has declined steadily over the last twenty-one months from 1,733,328 to 1,640,656 on Jan. 31, 1949. The number of veterans in training under the G. I. Bill and Public Law 16 also decreased about 193,000 since Jan. 31, 1948.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ARKANSAS

Annual State Medical Meeting.—The annual session of the Arkansas Medical Society will be held at the Robinson Auditorium, Little Rock, April 14-16 under the presidency of Dr. Pearlie W. Lutterloh, Jonesboro. Out of state speakers include:

Hubert L. Allen, Alton, Ill., Rupture of the Pregnant Uterus.
Mr. Mac F. Cahal, Kansas City, Mo., Caution—Curves Ahead.
Edward S. Miller, Denver, Diagnosis and Treatment of Poliomyelitis.
George Crile Jr., Cleveland, Treatment of Diseases of the Thyroid.
A. Carlton Ernstene, Cleveland, Diagnosis and Treatment of Cardiac Arrhythmias.
R. Lee Clark Jr., Houston, Texas, Present Status of Cancer Therapy.

A scientific program will be presented by the faculty of the University of Arkansas School of Medicine, Little Rock, on Thursday afternoon, and an eye, ear, nose and throat section program will be held on Friday. The Woman's Auxiliary to the state society will meet at the Hotel Marion April 14-15.

CALIFORNIA

Typhus Drops 66 Per Cent.—After a year's intensive rodent control work by the Los Angeles City Health Department the incidence of typhus has dropped to less than one third of what it was in 1947. The health department has enforced city council ordinances which require: (1) ratproofing of buildings; (2) elimination of rat shelters; (3) ratproof storage of foods, and (4) extermination. To protect Los Angeles harbor the health department has working arrangements with the Harbor Department, which provides six men full time to cover the Wilmington-San Pedro district. A block by block control program to ratstop buildings and private property in the area where most of the cases of typhus have been reported has had great success. Special health department educational classes have been held for 125 pest control operators in the city and an educational program is currently being carried out.

COLORADO

Western Colorado Spring Clinics.—The Colorado State Medical Society's Western Colorado Spring Clinics will be held at Grand Junction April 23-24. Visiting speakers who will present papers both days are Drs. Philip Brown, Rochester, Minn.; Philip Thorek, Chicago, and George C. Griffith, Pasadena, Calif.

Children's Hospital Summer Clinics.—The Children's Hospital of Denver is offering June 29 to July 1 clinics, demonstrations, seminars and round table discussions of methods of diagnosis and treatment of diseases of infants and children. All of the specialty groups of the staff will participate in the program, which is designed for all physicians interested in children's diseases. Three guest speakers will augment the staff: Dr. Mitchell I. Rubin, professor of pediatrics, University of Buffalo, will participate in medical subjects; Dr. Wolf W. Zuelzer, professor of pediatric research at Wayne University College of Medicine, Detroit, in the hematologic and pathologic material, and Dr. Willis Potts, surgeon-in-chief of the Children's Memorial Hospital, Chicago. Registration will be limited to 75. Applications should be addressed to the Chairman of the Summer Clinics Committee, Children's Hospital, Denver.

ILLINOIS

Rabies in Suburbs.—Twenty-three rabid dogs had been reported in Cook County up to March 21 this year, which is more than twice the number for the corresponding period of 1948, when an all time record of 62 for the year was set. Suburban townships that have been quarantined for rabies which gives police authority to shoot all stray dogs on sight are Barrington, Bremen, Leyden, Lyons, Niles, Palos, Palatine, Proviso, Schaumberg, Thornton and Worth. Dr. Edward Piszczek, county health director, urges pet owners to have their dogs vaccinated against rabies.

Chicago

Kretschmer Memorial Lecture.—The eighth Edwin R. Kretschmer Memorial Lecture will be delivered at the Palmer House on Friday evening, April 29, by Dr. Maxwell M. Wintrobe, professor of medicine, University of Utah College of Medicine, Salt Lake City, on "Current Views Concerning the Nature and Management of Leukemia and Allied Disorders."

Special Meeting on Cancer.—A special meeting for cancer control month, sponsored by the Chicago Medical Society and the Illinois Division, American Cancer Society, will be held April 6, 8 p. m. at the John B. Murphy Memorial Auditorium. Dr. Charles B. Huggins, professor of surgery, University of Chicago School of Medicine, will speak on "Hormones and Cancer." Clarence C. Little, Sc.D., director, Jackson Memorial Laboratory, Bar Harbor, Maine, will speak on "Biological Research in Cancer."

Health Education Conference.—The Health Education Committee of the Welfare Council of Metropolitan Chicago and the Illinois State Department of Public Health are sponsoring a health education conference at the La Salle Hotel the morning of April 7. Among the speakers will be Dr. Iago Galdston, New York, executive secretary on medical information of the New York Academy of Medicine, who will speak on "Motivating Health Education"; Ben Park of the Chicago Industrial Health Association; Arthur Snider, science editor, *Chicago Daily News;* Thomas Jones, University of Illinois Research and Educational Hospitals, and T. Arthur Turner, managing editor, Medical Abstracts Service. The moderator will be Cyril O. Houle of the University of Chicago.

Personals.—Dr. Percival Bailey, professor of neurology and neurosurgery at the University of Illinois and former University of Chicago faculty member, was principal speaker at the annual faculty-student banquet for the graduating class of the University of Chicago Medical School March 17.——Dr. Herman L. Kretschmer, clinical professor of urology at the University of Illinois College of Medicine, has been awarded the Cross of the Chevalier of the Legion of Honor of France in behalf of his contributions to medicine and his efforts in having the Pasteur monument moved from Grant Park to Convalescent Park, opposite Cook County Hospital. Under his direction, funds totaling $25,000 were raised to transfer the monument erected in 1928 and presented to the city by medical groups and French descendants in Chicago. A road-widening project made removal of the monument necessary.

KENTUCKY

Dr. Schoenbach Visiting Professor.—Dr. Emanuel B. Schoenbach, associate professor of the department of preventive medicine, Johns Hopkins University School of Medicine, Baltimore, will serve as visiting commonwealth professor of medicine at the University of Louisville School of Medicine during the week of April 17-23. He will present a series of discussions on "The Mechanism of Actions and Indications for the Newer Antibiotics." He will also discuss "The Treatment of Rickettsial Infections" and "The Experimental Investigations on the Chemo-Therapy of Neoplasms."

Kentucky Physicians Service Plan.—Articles of incorporation for the Kentucky Physicians Service Plan have been filed by the Kentucky State Medical Association. This plan, which is the Kentucky State Medical Association's alternative to the government's proposed health insurance, must be approved by 51 per cent of the physicians in a county, by the state health department and by the State Director of Insurance before it can become effective. Dr. Oscar O. Miller, Louisville, Ky., who as chairman of the committee is responsible for completing arrangements for operation of the plan, heads the directors of the new corporation consisting of twenty other state physicians. Dr. Bruce Underwood, secretary of the Kentucky State Medical Association, is the resident agent of the corporation.

LOUISIANA

Special Meeting on Socialized Medicine.—The Louisiana State Medical Society called a special meeting February 20 in Alexandria to discuss the national compulsory health insurance program. The group was addressed by Dr. R. B. Robins, Camden, Ark., a member of the coordinating committee of the American Medical Association; Mr. Forest A. Harness of Kokomo, Ind., a former congressman, and Mr. John F. McCloskey, dean of the College of Pharmacy, Loyola University School of Pharmacy, New Orleans. A meeting of the house of delegates was held on Sunday afternoon and the house adopted a resolution reaffirming its stand against compulsory health insurance.

MARYLAND

Lecture on Blindness Prevention.—Dr. Haven Emerson, New York, will be the principal speaker at the annual luncheon meeting of the Maryland Society for the Prevention of Blindness April 27 at the Southern Hotel, Baltimore. He will discuss the relationship of the official and voluntary health agencies in the program of blindness prevention.

Dr. Ballentine Appointed to Johns Hopkins.—Robert Ballentine, Ph.D., of Rutgers University, New Brunswick, N. J., was recently appointed associate professor of biology at Johns Hopkins University, Baltimore. He has been assigned to nutrition research work with radioactive elements. He will join Dr. William D. McElroy of the biology department in research work under the university's $500,000 McCollum-Pratt fund for the study of the bearing which so-called trace elements in the soil have on the nutrition of men, plants and animals. Dr. Ballentine is a graduate of Princeton University, Princeton, N. J., and has been research fellow for the Rockefeller Institute and a Guggenheim research fellow.

MINNESOTA

University Cancer Center.—Of 1,454 persons examined at the University of Minnesota's Cancer Detection Center in Minneapolis during the first year of its operation, 801 were referred to their physicians for treatment of some physical abnormality, according to Dr. David State, director of the center. Of these persons 18 suffered some form of cancer and some were found to have other conditions requiring medical attention. Over 650 were free of any ailments. Doctors also detected 379 precancerous conditions which might turn into cancer, 186 benign tumors and 469 instances of noncancerous medical conditions. To accommodate more applicants the Cancer Detection Center will operate five days per week instead of on the two day basis which has been in effect. Almost 15,000 persons have applied, but the Center has a capacity of only 28 to 30 patients per week; under the five day service about 75 persons can be examined each week. No appointments for examinations are being made further ahead than six months. The center, open to Minnesota men and women 45 and over, is financed in part by the Minnesota Division of the American Cancer Society, the National Cancer Institute of the U. S. Public Health Service and the university's malignant disease research fund. A small share of the center's expenses has been derived from the $5 registration fee, which will be raised to $10 April 1.

MISSOURI

The Rev. Schwitalla Resigns as Dean.—The resignation of the Rev. Alphonse M. Schwitalla, S.J., Sc.D., as dean of the St. Louis University School of Medicine was announced in December. Necessitated by ill health, the resignation was effective immediately. Father Schwitalla completed his twenty-first year as dean of the school of medicine on December 3. In addition to serving the school in an advisory capacity, he plans to devote his attention to writing in the fields of medical and nursing education as well as of hospital administration. The Rev. Edward T. Foote, S.J., formerly assistant dean, has been named regent of the school of medicine.

Dr. Post Receives Dana Medal.—Dr. Lawrence T. Post, St. Louis, received the Leslie Dana Gold Medal for 1948, a national award given annually by the National Society for the Prevention of Blindness for outstanding achievement in the prevention of blindness and conservation of vision. Dr. Post was selected by the St. Louis Society for the Blind, through which the medal is offered on the recommendation of the Association of Research in Ophthalmology. The award was presented at a dinner March 25 in St. Louis. Dr. Post is professor of clinical ophthalmology and head of the department of ophthalmology at Washington University School of Medicine, St. Louis. He received his M.D. degree from Johns Hopkins University School of Medicine, Baltimore, in 1913. He has served as president of the American Academy of Ophthalmology and Otolaryngology and chairman of the Section on Ophthalmology of the American Medical Association.

NEW MEXICO

Clinical Society Lectures.—The New Mexico Clinical Society at its April meeting will hear Dr. Charles L. Martin, professor of radiology, Southwestern Medical College, Dallas, Texas, speak at the Veterans Administration Hospital in Albuquerque April 18 at 8 p. m. He will give an illustrated lecture on "The Treatment of Cancer of the Face, Lip and Mouth, and Metastatic Lymph Node with Irradiation."

NEW YORK

Clinical Day for Alumni.—The Alumni Association of the University of Buffalo School of Medicine will conduct its twelfth Annual Spring Clinical Day April 9 at the Hotel Statler, Buffalo. Among the speakers will be Drs. Harry M. Tiebout, Greenwich, Conn.; Harry M. Margolis, Pittsburgh; Maxwell Finland, Boston, and Nolan D. C. Lewis, George G. Deaver, and Irving S. Wright, all of New York.

Postgraduate Instruction.—The Medical Society of the State of New York with the cooperation of the New York State Department of Health has arranged a postgraduate lecture for the Herkimer County Medical Society to be given April 12, 5 p. m. at Prospect Hotel, Herkimer. Dr. John G. Fred Hiss, Syracuse, will speak on "Rheumatic Fever." The Geneva Academy of Medicine meeting at the Bellhurst Restaurant in Geneva April 21 at 8:30 p. m. will hear Dr. Harry Bakwin, New York, speak on "Clinical Child Psychology."

New York City

Seventh Harvey Lecture.—David Rittenberg, Ph.D., associate professor of biochemistry, Columbia University College of Physicians and Surgeons, will deliver the seventh Harvey Lecture of the current series at the New York Academy of Medicine April 21 on "Dynamic Aspects of the Metabolism of Amino Acids."

Long Island College Alumni Dinner.—The annual dinner of the Alumni Association of the Long Island College of Medicine will be held on April 30, 7 p. m. at the Columbus Club, 1 Prospect Park West, Brooklyn. The principal speaker will be Dr. Jean A. Curran, president of the Long Island College of Medicine.

Society Elections.—The Doctors Club of Brooklyn on January 22 installed Drs. David A. Meiselas as president, Bernard Seligman, treasurer, and Mortimer M. Kopp, secretary. Dr. Irwin E. Siris received an illuminated scroll for his outstanding service to the club and to the community and in honor of his accession to the presidency of the Medical Society of the County of Kings and the Brooklyn Academy of Medicine.——The Bronx Pediatric Society has chosen the following officers for the current year: Drs. Nathan M. Greenstein, president, and George Weiss, secretary.

Dr. Haas Honored.—A golden jubilee luncheon for Dr. Sidney V. Haas, in recognition of his contributions to pediatrics and the completion of his fiftieth year of medical practice, will be held at the New York Academy of Medicine April 5. Speakers will include Robert Moses, park commissioner of New York City; Dr. Murray H. Bass, pediatrician, and Dr. Evan Evans. Dr. Haas will receive a Golden Book of Tributes from leaders throughout the world in pediatrics and related fields. Dr. Haas was a pioneer in celiac therapy and in the treatment of the hypertonic infant. The Medical Committee is made up of Dr. Evans, chairman, and Drs. George Baehr, Murray H. Bass, L. Emmett Holt Jr., Rustin McIntosh and Benjamin P. Watson.

Dr. Hinton Becomes Surgical Chief.—Dr. J. William Hinton, director of surgery at University Hospital, has been given additional duties as professor of surgery at Postgraduate Medical School, New York University-Bellevue Medical Center. In the new post he will also be director of the Fourth Surgical Division, Bellevue Hospital. Dr. John H. Mulholland remains as professor of surgery, New York University College of Medicine, and director of the Third Surgical Division, Bellevue Hospital. Under Dr. Hinton's direction, care of patients, teaching of doctors on a postgraduate level and various research projects will be carried out on the Fourth Surgical Division of Bellevue. A professor of clinical surgery on the New York University medical faculty since 1944, Dr. Hinton has been director of surgery at the former Post-Graduate Hospital since June 1947. He is a member of the Council, New York Surgical Society; chairman of the Committee on Applicants, American College of Surgeons, and chairman of the Committee on Professional Standards, New York Academy of Medicine. In 1946 and 1947 he was clinical professor on the medical faculty of Columbia University. He was graduated from the University of Virginia Department of Medicine, Charlottesville, in 1919.

Personals.—Dr. Samuel M. Wishik of the U. S. Children's Bureau, Washington, D. C., has been named director of the Bureau for Mothers and Young Children in the City of New York Health Department. Dr. Wishik, a graduate of the Columbia University College of Physicians and Surgeons, 1929, served with the city health department 1939-1942 and 1946-1947.——Dr. George M. Wheatley has been appointed a third vice president of the Metropolitan Life Insurance

Company and will be concerned with the supervision of the company's health and welfare activities. He is a graduate of Harvard Medical School, Boston, and has been with the company since 1941.——Dr. Frederic Wertham, director of the Lafargue Clinic in New York City and president of the Association for the Advancement of Psychotherapy from 1943 to 1947, was presented a Certificate of Merit for his outstanding contribution through the years to the Adult Education Program of the Queens Federation of Mothers' Clubs, Inc. This is the first such award the federation has made in the forty years of its existence.——Dr. William Antopol, Lyons, N. J., has been appointed director of laboratories of Beth Israel Hospital and director of research of the Joseph and Helen Yeamans Levy Foundation. The foundation was established in 1946 to conduct research. Dr. Antopol is director of laboratories and chief pathologist of the Newark Beth Israel Hospital at Lyons, N. J.

TENNESSEE

State Medical Meeting.—The Tennessee State Medical Association will hold its annual meeting at Read House, Chattanooga, April 12-13 under the presidency of Dr. Harley W. Qualls, Memphis. The tentative program lists the following guest speakers:

Thomas J. Dry, Rochester, Minn., Treatment of Congenital Heart Failure.
Col. James H. Forsee, Denver, Surgical Treatment of Malignant Lesions of the Gastro-Intestinal Tract.
David G. Miller Jr., Morgantown, Ky., For What Type Practice Should the Physician Be Trained?
Lawrence Reynolds, Detroit, Polypsis of the Colon.
Col. Elbert DeCoursey, Washington, D. C., Medical Aspects of Atomic Explosion.
Paul A. Davis, Akron, Ohio, Subject to be announced.

An obstetric symposium with Dr. Frank E. Whitacre, Memphis, as moderator will be presented by the obstetric staff of the University of Tennessee. The medical staff of Vanderbilt University, Nashville, will conduct a symposium on "Headaches of the General Practitioner," with Dr. Rudolph H. Kampmeier as moderator. Tuesday night session speakers include besides the president, Dr. Roscoe L. Sensenich, President, American Medical Association, South Bend, Ind., and Dr. Louis A. M. Krause, Baltimore.

TEXAS

State Medical Journal.—The *Texas State Journal of Medicine* appeared in January redesigned from the standpoint of cover, layout and typography. The blue and white cover printed in black ink utilizes the state insignia, the star, within which is an outline of the caduceus.

Scientific Meeting of Texas Rheumatism Association.—The Texas Rheumatism Association, founded in 1948, will hold its first scientific session May 2 in San Antonio. Guest speakers include: Drs. W. Paul Holbrook, Tucson, Ariz., president of the Arthritis and Rheumatism Foundation; Paul R. Lipscomb, orthopedic surgeon of the Mayo Clinic, Rochester, Minn.; James O. Finney, assistant professor of medicine in charge of the Arthritis Clinic, Medical College of Alabama, Birmingham, Ala., and William K. Ishmael, president of the Oklahoma Rheumatism Association, Oklahoma City.

VIRGINIA

Williams Memorial Lecture.—A group of residents who trained under Dr. Tiffany J. Williams when he was professor of obstetrics and gynecology at the University of Virginia Department of Medicine, Charlottesville, 1931-1947, have established a lectureship fund in his memory. The initial annual memorial lecture will be given at the university April 8 by Dr. Nicholson J. Eastman, Johns Hopkins Hospital, Baltimore.

Advisors to Division of Alcoholic Studies.—A committee of technical advisors for the state's new division of alcoholic studies and rehabilitation has been secured by the Virginia Department of Health. The committee will help with the medical and psychiatric aspects of the control of alcoholism. Members of the committee outside the state include Drs. Robert Fleming, Boston; Georgio Lolli, New Haven, Conn., and Joseph Hirsh, Birmingham, Ala. Members of the committee from the state include Dr. R. Finley Gayle and Dr. Harvey B. Haag, dean, the Medical College of Virginia at Richmond; Dr. William Porter of the Medical College of Virginia Hospital in Richmond; Dr. Henry B. Mulholland, assistant dean, University of Virginia Department of Medicine, Charlottesville; Dr. David C. Wilson, Charlottesville; Dr. Joseph E. Barrett, Richmond, and Dr. M. Pierce Rucker, president of the Medical Society of Virginia, Richmond. Earlier an advisory committee of laymen was named to assist the division in sociologic phases of the work.

WEST VIRGINIA

First Rheumatic Fever Clinic.—West Virginia's first rheumatic fever diagnostic clinic was opened at the health center in Fairmont March 10. The new clinic was made possible by close cooperation between the Marion County Medical Society and the county health department. It is estimated that the expenses for operating the clinic will be between $15,000 and $20,000 per year. The Marion County Medical Society will designate members who will be in charge of the clinic for a two month period throughout the year. The schedule for professional supervision has been completed for the remainder of the year. Over-all administration will be in charge of Dr. Claude L. Holland and Dr. Ormond L. Haynes, pediatricians, and Dr. A. Glenn Evans, county health officer. Drs. John P. Helmick, J. J. Jenkins Jr., Robert H. Jones and L. Rush Lambert have been named consultants. Patients will be accepted only on referral from the family physician. Arrangements have been made with Fairmont General Hospital for the care of children who are found to need hospitalization. Clinical services will include physical examination, fluoroscopy of the chest, chest roentgenograms, urinalysis, blood count, an electrocardiogram and a blood sedimentation test. A complete diagnosis with recommendations will be sent to the family physician. West Virginia is the twenty-sixth state to establish a diagnostic rheumatic fever clinic.

WISCONSIN

Chair of Medical History.—A new chair has been created in the Marquette University School of Medicine with the appointment of Dr. G. Kasten Tallmadge as professor of the history of medicine. Dr. Tallmadge is the first professor of medical history at Marquette. A Marquette Medical School faculty member for eighteen years, he is also an assistant professor of anatomy. In addition to a doctor of medicine degree, he holds the degrees of master of arts and doctor of philosophy.

State Society Begins Doctor Placement Service.—The Council on Medical Service and Public Relations of the State Medical Society of Wisconsin has developed a plan to encourage physicians to locate in areas of the state where they are most needed. At the time examinations are given by the State Board of Medical Examiners, each physician will be interviewed to find out whether he has decided where to practice or if he is looking for available location. If he has no definite plans, he will be advised of communities in Wisconsin that are interested in obtaining physicians' services. Details about the community, including schools, population, availability of hospital facilities, ambulance service and nursing care, housing, roads and other related facts gathered by members of the medical society, are available to interested physicians. Nearly thirty communities have filed information with the medical society. The plan was made available to nearly sixty applicants for licensure who took medical examinations at the January meeting of the board.

GENERAL

Special Society Meeting.—The annual meeting of the American Laryngological, Rhinological and Otological Society, Inc., will be held at the Drake Hotel, Chicago, April 18-20 under the presidency of Dr. John J. Shea, Memphis, Tenn. The guest of honor will be Dr. Claude C. Cody, Houston, Texas, who will speak on "Treatment of Carcinoma of the Larynx: A Statistical Study of Results." Others speaking by invitation are Drs. Hart E. Van Riper, New York; E. W. Alton Ochsner, New Orleans; Herman J. Moersch, Rochester, Minn., and Robert Buxton, Ann Arbor, Mich. The president's reception and the annual banquet will be held Wednesday at 5:30 p. m.

Institute for Muscle Research.—A group of scientists headed by Dr. A. Szent-Györgyi, Bethesda, Md., is organizing an Institute for Muscle Research. The institute has a laboratory at the Marine Biological Laboratory at Woods Hole, where seven researchers are working. Another group is conducting research at the National Institutes of Health, Bethesda, Md. The research outside this institute is financed by the Muscle Institute, which attempts to collect funds and has received $25,000 from the American Heart Association. The institute was founded with the aim to provide means necessary for the continuation of Dr. Szent-Györgyi's research in the United States.

To Form Society in Forensic Sciences.—In January 1948 a group of forensic scientists met, at the invitation of Dr. Rutherford B. H. Gradwohl, in St. Louis, to consider the formation of a society devoted to the interests of forensic science. The gathering included medicolegal experts, pathologists, chemists, toxicologists, psychiatrists and those connected with police science laboratories. A second convocation of a Steering Committee was held in New York in October 1948.

Since that time Dr. Gradwohl has appointed committees which are preparing the way for an organizational meeting. Interested persons may secure further information from Dr. Gradwohl, 3514 Lucas Avenue, St. Louis, or Professor Ralph F. Turner, Michigan State College, East Lansing, Mich.

Lowest Infant Death Rate on Record.—The U. S. Public Health Service reports that the infant death rate in 1947 was the lowest on record and indications are that the 1948 infant death rate will be even lower. In 1947 119,173 babies died before reaching their first birthday, a proportion of 32.2 deaths for every 1,000 live births. In 1946 the rate was 33.8 for every 1,000 live births. The service estimated that the 1948 rate would be 31.8 for every 1,000 live births. According to the report, 75.7 per cent of infant deaths in 1947 could be traced to five causes: premature birth, 11.1; congenital malformations, 4.6; pneumonia and influenza, 3.6; injury at birth, 3.5, and asphyxia and atelectasis, 1.6. It was found that the death rate was higher among nonwhite babies (48.5) than among white infants (30.1) and higher for boys than for girls.

National Foundation for Cerebral Palsy.—At the first national public conference in New York on cerebral palsy the formation of the National Foundation for Cerebral Palsy was announced by Leonard Goldenson, president. The foundation will serve as "a clearing house of information, a coordinating agency and driving force" for cerebral palsy organizations throughout the country. Other officers of the foundation were listed as Mr. Arthur Larschan, New York, and Mr. Albert Felmet Jr., president of the New York State Cerebral Palsy Association, which sponsored the conference, and Mrs. James Killilea of Rye, chairman of the board. Mr. Larschan and Mrs. Killilea are vice presidents of the state organization. They and Dr. Foster Kennedy, chief of neurology at Bellevue Hospital, were the incorporators.

Society Elections.—The Southeastern Allergy Association at its annual meeting in Durham, N. C., in January, elected Dr. Oscar Swineford Jr., Charlottesville, Va., president, and reelected Dr. E. Katharine Baylis MacInnis, Columbia, S. C., secretary-treasurer. Dr. Lewis D. Hoppe, Atlanta, Ga., and Dr. G. Frederick Hieber, St. Petersburg, Fla., were elected executive committeemen at large. The 1950 meeting will be held in Columbia, S. C.——The International Academy of Proctology, 45-45 Kissena Blvd., Flushing, Long Island, N. Y., has chosen as its officers for 1949 Drs. Joseph H. Judd, M.D., Pittsburgh, international president; Mark L. Emerson, Oakland, Calif., president-elect; Edgar M. Scott Jr., Birmingham, Ala., secretary-general; Manuel G. Spiesman, Chicago, treasurer, and Alfred J. Cantor, Flushing, Long Island, N. Y., secretary. Information for affiliation with the academy may be obtained by writing to the secretary, Dr. Alfred J. Cantor, Flushing, Long Island.

Maternal Mortality Rate at New Low.—The final tabulation of the number of births in 1947, released by the National Office of Vital Statistics on Feb. 17, 1949, reports 3,699,940 births for 1947, a new high for the United States. At the same time a record low maternal death rate has been reached. In the Dec. 15, 1948 release of the National Office of Vital Statistics the number of maternal deaths for 1947 was given as 4,978. This results in a maternal mortality rate of 1.3 deaths per thousand live births. The most recent maternal mortality rates listed in the Summary of International Vital Statistics, 1937-1944, National Office of Vital Statistics, cite no annual rate as low as the one achieved by the United States in 1947. It is clear that the United States now ranks first among all nations or is very close to achieving this rank. The white maternal mortality rate for 1946 was 1.3. The gain in one year has been sufficient to reduce the national rate in 1947 to that of the white rate in the previous year.

Foundation Appoints Scholars in Medical Science.—Thirteen young scientists have been appointed as the second group of scholars in medical science, under the plan begun in 1948 by the John and Mary R. Markle Foundation to assist men and women wishing to remain in academic medicine. The scholars were selected from candidates nominated by accredited medical schools in the United States and Canada and interviewed by regional committees appointed by the foundation. The sum of $325,000 has been appropriated for their support, to be allotted in grants of $25,000 each at the rate of $5,000 a year, to the medical schools in which they now hold faculty appointments. A total of twenty-nine doctors have now received appointments as scholars. It is expected that fifty will be appointed during the five year program and that a total of $1,250,000 will be appropriated toward their support.

The thirteen scholars, all but one physicians, whose appointments begin in 1949, and the schools that will receive the $25,000 grants for their support are: Francis P. Chinard, clinical chemistry and physiology, Johns Hopkins University School of Medicine; Donald W. Fawcett, microscopic anatomy, Harvard Medical School; Allan V. N. Goodyer, internal medicine and cardiovascular disease, Yale University School of Medicine; John B. Graham, pathology, University of North Carolina School of Medicine, Chapel Hill; John D. Green, anatomy and physiology, Wayne University College of Medicine, Detroit; George Watson James III, internal medicine and physiology, Medical College of Virginia, Richmond; Ralph Jones Jr., clinical therapeutics, University of Pennsylvania School of Medicine; George E. Moore, surgery and oncology, University of Minnesota Medical School; C. Barber Mueller, surgery and biochemistry, Washington University School of Medicine, St. Louis; George W. Schwert Jr., Ph.D., physical biochemistry, Duke University School of Medicine, Durham, N. C.; Beverly T. Towery, internal medicine and endocrinology, Vanderbilt University School of Medicine, Nashville, Tenn.; W. Clarke Wescoe, pharmacology, Cornell University Medical College, New York, and Donald R. Wilson, internal medicine and endocrinology, University of Alberta Faculty of Medicine, Edmonton, Alberta, Canada.

CANADA

Dr. McCulloch Awarded Reeve Prize.—Dr. John C. McCulloch of the University of Toronto Faculty of Medicine has been awarded the Reeve Prize for his study in conjunction with Dr. Robert J. P. McCulloch on "A Hereditary and Clinical Study of Choroideremia." The award is made for the best scientific research accomplished in any department in the faculty of medicine by one who has held appointment on the staff not more than five years.

Dr. Weaver Named Dean at Canadian University.—Dr. Myron M. Weaver, assistant dean of medical sciences at the University of Minnesota, Minneapolis, has been chosen dean of the new medical school at the University of British Columbia, Vancouver, effective in July. Dr. Weaver, a graduate of Rush Medical College, 1932, is a specialist certified by the American Board of Internal Medicine and member of other scientific groups. His clinical specialties are studies in diabetes and nutrition.

CORRECTIONS

Research in Diarrheal Diseases.—A research project on diarrheal diseases is being carried on at the Louisiana State University School of Medicine, New Orleans, not at the Tulane University School of Medicine as was stated in The Journal, January 1, page 44.

University Honors Dr. Lehman.—In the January 22 issue of The Journal, page 241, the school at which Dr. Edwin P. Lehman is located should have been the University of Virginia Department of Medicine at Charlottesville and not the Medical College of Virginia at Richmond, as was stated in the news item. Dr. Lehman was honored for his twenty years of service as professor of surgery and gynecology at the university.

Marriages

Charles Hyatt Field, Birmingham, Ala., to Miss Helen Virginia Minges of Rocky Mount, N. C., February 3.

McKenzie Parker Moore Jr., Charleston, S. C., to Miss Amy Ashburn Lofton of McClellanville, November 6.

John Wood Hayden, Rochester, N. Y., to Miss Mary Phyllis Briddell of Crisfield, Md., December 28.

George William Ware, Washington, D. C., to Miss Patricia Kirby Jay of Marion, N. C., January 29.

Robert G. Eisenhardt, Canisteo, N. Y., to Miss Annette Elizabeth Hull of Arkport, January 8.

Julius H. Winer to Miss Naomi Sari Borowsky, both of Beverly Hills, California, February 6.

George E. Howell, Meridian, Miss., to Miss Mathilde Turner of Atlanta, Ga., February 5.

Helen S. Barnard to Mr. J. Fred Boyd, both of Muskegon, Mich., in New York, February 5.

Virginia Maria Ferrara to Mr. John Marvin Cannon, both of Detroit, January 22.

Reuben Turner to Miss Veronica Mary Adkins, both of New York, recently.

Deaths

John Elmer Weeks ⊕ Portland, Ore.; born in Painesville, Ohio, in 1853; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1881; for many years professor of ophthalmology and later professor emeritus at the University and Bellevue Hospital Medical College, now known as the New York University College of Medicine; in 1940 was appointed honorary professor of ophthalmology and later professor emeritus at the University of Oregon Medical School; in 1921 he established a scholarship for ophthalmologic research at the University of Michigan Medical School in Ann Arbor; specialist certified by the American Board of Ophthalmology and the Royal College of Physicians and Surgeons of Canada; in 1902 chairman of the Section on Ophthalmology and in 1910 and 1911 member of the House of Delegates of the American Medical Association, which in 1929 awarded him the Ophthalmic Research Medal for his contribution to the science of ophthalmology; past president of the American Ophthalmological Society and the New York County Medical Society; member of the American Academy of Ophthalmology and Otolaryngology, Association for Research in Ophthalmology and the Pacific Coast Oto-Ophthalmological Society; fellow of the American College of Surgeons; served during World War I; consultant in ophthalmologic surgery at Doernbecher Memorial Hospital for Children in Portland and the New York Eye and Ear Infirmary; co-discoverer with Dr. Robert Koch, of the Koch-Weeks bacillus which causes conjunctivitis; held honorary degrees from the University of Michigan, New York University and the University of Oregon; author of "Treatise on Diseases of the Eyes"; died in La Jolla, Calif., February 2, aged 95.

Alvin Clay McCall ⊕ Asheville, N. C.; born in Marion, N. C., Oct. 10, 1889; University of Maryland School of Medicine, Baltimore, 1910; fellow of the American College of Surgeons; past president of the Buncombe County Medical Society; served overseas during World War I and during World War II on the district board of appeals of the Selective Service System; formerly member of the county board of health; charter member of the staff of Aston Park Hospital, which he was instrumental in organizing; on the staffs of the Mission and Biltmore hospitals; died December 2, aged 59, of coronary thrombosis.

Joseph Aarons, Detroit (licensed in Michigan in 1900); died January 7, aged 86, of gastroenteritis.

Alanson Joseph Abbe, Winter Park, Fla.; Harvard Medical School, Boston, 1885; member of the American Medical Association and of the Massachusetts Medical Society; formerly on the staff of Union Hospital in Fall River, Mass.; died January 3, aged 87, of heart failure following renal colic.

Albyn Lincoln Adams ⊕ Jacksonville, Ill.; Bennett Medical College, Chicago, 1886; College of Physicians and Surgeons, medical department of Columbia College, New York, 1889; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; affiliated with the Passavant Memorial Hospital, Our Saviour's Hospital and the Illinois School for the Blind; oculist and aurist to the Chicago and Alton Railroad; died January 31, aged 83, of cerebral hemorrhage.

Xeno F. Alexander, Dodge City, Kan.; Ensworth Medical College, St. Joseph, Mo., 1907; county health officer; member of the American Medical Association; died in the Murray Memorial Hospital January 7, aged 67, of coronary thrombosis.

Charles Walker Allen, Washington, D. C.; Jefferson Medical College of Philadelphia, 1903; member of the American Medical Association; on the staff of the George Washington University Hospital; died January 17, aged 69, of nephritis and endocarditis.

Joseph Elias Anderson, Moore, Okla.; Chattanooga (Tenn.) Medical College, 1896; died January 7, aged 79.

John Christian MacEvitt Auwerda, Brooklyn; Long Island College Hospital, Brooklyn, 1912; member of the American Medical Association; specialist certified by the American Board of Otolaryngology; fellow of the American College of Surgeons; affiliated with the Brooklyn Eye and Ear Hospital, St. Mary's Hospital, Hospital of the Holy Family, Norwegian Lutheran Deaconesses' Home and Hospital and the Nassau Hospital in Mineola, N. Y.; died January 11, aged 60, of coronary thrombosis.

Ezra Robert Baldridge ⊕ Terre Haute, Ind.; Eclectic Medical Institute, Cincinnati, 1896; on the staff of the Union Hospital; died January 15, aged 75, of coronary thrombosis with myocardial infarction.

Bart M. Ballenger, Strong City, Okla.; University of Tennessee Medical Department, Nashville, 1889; died in Elk City, January 17, aged 84.

Joseph J. Bansbach ⊕ St. Joseph, Mo.; Ensworth Medical College, St. Joseph, 1898; an Associate Fellow of the American Medical Association; specialist certified by the American Board of Urology; member of the American Urological Association; fellow of the American College of Surgeons; affiliated with St. Joseph's and Methodist hospitals; member of the Welfare Board; died January 19, aged 72, of carcinoma of the lung.

Mark Adolph Baush ⊕ Allentown, Pa.; Jefferson Medical College of Philadelphia, 1923; served during World War I; affiliated with the Allentown Hospital, where he died January 3, aged 51, of malignant hypertension.

John Sherrill Betz, Kansas City, Kan.; University of Michigan Medical School, Ann Arbor, 1937; member of the American Medical Association; served during World War II; on the faculty of the University of Kansas School of Medicine; affiliated with St. Margaret's Hospital, Bethany Hospital and Providence Hospital, where he died January 18, aged 39, of coronary occlusion with infarction.

Thomas Dalzell Blair, Watchung, N. J.; New York Homeopathic Medical College and Hospital, New York, 1903; member of the American Medical Association; served on the staff of the Muhlenberg Hospital, Plainfield, where he died January 2, aged 72, of carcinoma of the prostate.

George Elbert Bogart, Sherwood, Tenn.; Vanderbilt University School of Medicine, Nashville, Tenn., 1908; died in the Erlanger Hospital, Chattanooga, January 23, aged 65.

Louis Bothman ⊕ Chicago; Rush Medical College, Chicago, 1917; clinical professor of ophthalmology at the University of Illinois College of Medicine; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Otolaryngology and the Association for Research in Ophthalmology; fellow of the American College of Surgeons; served during World War I; on the staff of St. Luke's Hospital; died January 19, aged 55, of chronic myocarditis.

Philip H. Bourne, Salamanca, N. Y.; University of Michigan Homeopathic Medical School, Ann Arbor, 1891; member of the American Medical Association; past president of the Cattaraugus County Medical Society; examining physician for local draft boards during World Wars I and II; served as school physician, medical examiner for the Erie Railroad, and as health officer of Salamanca; for many years county coroner; died January 2, aged 79, of cerebral hemorrhage.

Albert Wellington Bridge, Tacoma, Wash.; University of Vermont College of Medicine, Burlington, 1905; died in the Tacoma General Hospital January 6, aged 69, of cerebral hemorrhage.

Edward Majors Brown, Chattanooga, Tenn.; Meharry Medical College, Nashville, 1919; died in the Veterans Administration Hospital, Tuskegee, Ala., January 13, aged 58.

William John Buck, Belle Glade, Fla.; Hering Medical College, Chicago, 1912; member of the American Medical Association; died January 14, aged 60.

Ina Van Derhoof Burt, Phelps, N. Y.; Woman's Medical College of the New York Infirmary for Women and Children, New York, 1895; member of the American Medical Association; for many years health officer of the town and village of Phelps and affiliated with the State Teachers College in Fredonia; died in the Geneva (N. Y.) General Hospital January 2, aged 81, of cerebral hemorrhage.

John Harold Butts, Ellaville, Ga.; State University of Iowa College of Medicine, Iowa City, 1919; member of the Iowa State Medical Society and the American Medical Association; served during World War II; affiliated with St. Francis, Presbyterian and Allen Memorial hospitals in Waterloo, Ia.; died January 21, aged 54, of encephalomyelitis following rabies vaccination.

Hugh Carmichael ⊕ Sacramento, Calif.; College of Medical Evangelists, Loma Linda and Los Angeles, 1934; associated with the Sutter Hospital; died January 13, aged 48.

Charles Hervey Carter ⊕ Eastland, Texas; Vanderbilt University School of Medicine, Nashville, Tenn., 1907; died in Ranger, January 22, aged 65, of cerebral hemorrhage and hypertension.

George Otis Castellaw, Commerce, Ga.; Atlanta College of Physicians and Surgeons, 1913; formerly councilman and mayor; died January 23, aged 64, of carcinoma of the pancreas.

William Dennis Cawley, Elkton, Md.; University of Maryland School of Medicine, Baltimore, 1902; member of the American Medical Association; served during World War I; died January 11, aged 76, of acute coronary disease.

Irving Lee Chapman ⊕ South Norfolk, Va.; Baltimore Medical College, 1904; city health officer; on the staffs of the Leigh Memorial Hospital and De Paul Hospital, where he died January 20, aged 69, of cerebral thrombosis.

Grover Cleveland Coakley, Pasadena, Calif.; Northwestern University Medical School, Chicago, 1904; died January 7, aged 65.

Llewellyn Rathbun Cole ⊕ Madison, Wis.; University of Wisconsin Medical School, Madison, 1929; professor of clinical medicine and coordinator of graduate medical education at his alma mater, where he was director of the department of student health; served as director of the state medical society's radio series, the March of Medicine; fellow of the American College of Physicians; affiliated with the State of Wisconsin General Hospital; died January 1, aged 46, of subarachnoid hemorrhage.

Albert Wallace Cowan, Middlesboro, Ky.; Harvard Medical School, Boston, 1935; member of the American Medical Association; served during World War II; affiliated with Middlesboro Hospital, where he died January 30, aged 40, of carcinoma of the transverse colon.

Orville H. Cribbins, Sarasota, Fla.; University of Nashville Medical Department, 1906; member of the American Medical Association; affiliated with the Sarasota Hospital, where he died January 25, aged 68, of uremia and heart disease.

George Henry Crofton ⊕ Washington, D. C.; College of Physicians and Surgeons, Baltimore, 1914; formerly associated with the U. S. Public Health Service reserve and the Veterans Bureau; died January 8, aged 60, of coronary occlusion.

Charles Henry Crooks, St. Augustine, Fla.; College of Physicians and Surgeons, Medical Department Kansas City University, 1904; Presbyterian Medical Missionary in North Thailand, for many years; member of the Thailand Medical Society, Royal Society of Tropical Medicine and Hygiene and the American Society of Tropical Medicine; died January 17, aged 73, of coronary thrombosis.

Frederick Edward Cunningham ⊕ Chicago; Chicago College of Medicine and Surgery, 1912; died in New Orleans January 20, aged 63, of coronary occlusion.

Patrick Vincent Cunningham, Providence, R. I.; Baltimore Medical College, 1903; died in St. Joseph's Hospital January 22, aged 75, of chronic nephritis.

William Embury Dake, Rochester, N. Y.; Hahnemann Medical College and Hospital of Philadelphia, 1898; affiliated with Genesee Hospital, Highland Hospital and the Convalescent Hospital for Children; died January 7, aged 74, of arteriosclerotic heart disease, carcinoma of the rectum and coronary infarction.

Arnold Drexel ⊕ Wauwatosa, Wis.; University of Buffalo School of Medicine, 1889; an Associate Fellow of the American Medical Association; served on the staffs of Deaconess, Mount Sinai and St. Joseph's hospitals; died January 21, aged 85, of laryngeal carcinoma.

Frank Creighton Eastman, San Francisco; Stanford University School of Medicine, San Francisco, 1940; member of the American Medical Association; died in Vicksburg, Miss., January 14, aged 39, of heart disease.

Edwin James Evans, Ontonagon, Mich.; Detroit College of Medicine, 1896; formerly health officer of the Rockland township; served during World War I; died January 9, aged 77, of cerebral hemorrhage and arteriosclerosis.

Chester L. Farquharson, Houston, Texas (licensed in Texas in 1920); served during World War I; died January 24, aged 56, of cerebral thrombosis and uremia.

Oscar George Fegley, Yeadon, Pa.; Jefferson Medical College of Philadelphia, 1890; died in the Jefferson Hospital December 13, aged 81, of monocytic leukemia and uremia.

George MacIntire Ferguson, Philadelphia; Jefferson Medical College of Philadelphia, 1899; member of the American Medical Association; served during World War I; died in Joseph Price Memorial Hospital January 18, aged 74, of chronic myocarditis.

Paul Bernays Folger, Dobson, N. C.; Jefferson Medical College of Philadelphia, 1922; member of the American Medical Association; served in France during World War I; died in the Duke Hospital, Durham, January 15, aged 56, of cerebral hemorrhage.

Charles Bickley Fox, Monterey, Va.; University of Virginia Department of Medicine, Charlottesville, 1899; member of the American Medical Association; served as county coroner and as mayor; died in King's Daughters' Hospital, Staunton, January 26, aged 76, of hypostatic pneumonia and bronchiectasis.

William Robert Galbreath Jr., Shreveport, La.; Louisiana State University School of Medicine, New Orleans, 1939; member of the American Medical Association; served during World War II; on the staff of the North Louisiana Sanitarium; affiliated with the Veterans Administration Hospital in Jackson, Miss.; died in San Antonio, Texas, January 6, aged 38, of heart disease.

Sherwood P. Garrison ⊕ Bellevue, Ky.; Miami Medical College, Cincinnati, 1905; fellow of the American College of Surgeons; served as president of the Campbell County Health Board; president of the nurses' training school, trustee and vice president of the Speers Memorial Hospital, Dayton, where he was on the staff and where he died January 27, aged 67, of acute leukemia.

Bruno J. W. Glaubitz ⊕ Sheboygan, Wis.; the Hahnemann Medical College and Hospital, Chicago, 1917; affiliated with St. Nicholas Hospital and Sheboygan Memorial Hospital, where he died January 14, aged 59, of coronary occlusion.

Frank Raymond Gomila Sr., New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1908; member of the American Medical Association; served as commissioner of public safety; affiliated with Hotel Dieu, Charity Hospital and French Hospital, died in the Baptist Hospital January 22, aged 61, of coronary occlusion.

Edward Phillip Gramer, Chicago; University of Illinois College of Medicine, Chicago, 1920; associate clinical professor of surgery at Loyola University College of Medicine; specialist certified by the American Board of Surgery; fellow of the American College of Surgeons; affiliated with St. Anne's Hospital, where he died November 25, aged 56, of myocardial infarction.

Lowell McKee Green ⊕ Rushville, Ind.; Indiana Medical College, School of Medicine of Purdue University, Indianapolis, 1906; served during World War I; for many years county health officer; died January 3, aged 66, of coronary occlusion.

Edmund Harrison ⊕ Greensboro, N. C.; University College of Medicine, Richmond, 1896; died December 13, aged 75.

Malcom A. H. Hart, Milton, N. H.; University of the City of New York Medical Department, 1888; member of the American Medical Association; president of the board of trustees of the Nute High School; died in Bedford, Mass., January 24, aged 87, of arteriosclerotic heart disease and thrombophlebitis of the left leg.

Thomas Irwin Henning, Glens Falls, N. Y.; L.R.C.P., London, England, and M.R.C.S., England, 1890; died in Glens Falls Hospital January 8, aged 85, of arteriosclerosis.

George Stevenson Holeman, Centerville, Calif.; University of Oregon Medical School, Portland, 1921; a member of the American Medical Association; affiliated with San Jose (Calif.) Hospital, where he died December 8, aged 61.

Allen H. Hostetter, Lincoln, Neb.; Rush Medical College, Chicago, 1886; died December 4, aged 90, of heart disease.

Fredd Chandler House, Detroit; Cleveland Homeopathic Medical College, 1901; died in the Highland Park (Mich.) Hospital January 24, aged 67, of retroperitoneal abscess and generalized arteriosclerosis.

Charles Francis Howland ⊕ Des Moines; Northwestern University Medical School, Chicago, 1903; fellow of the American College of Surgeons; member of the staffs of the Iowa Methodist Hospital, Mercy Hospital and the Iowa Lutheran Hospital, where he died January 22, aged 69, of hemorrhage of stomach.

Josiah Herman Kirk ⊕ Palo Alto, Calif.; Cooper Medical College, San Francisco, 1906; member of the American Academy of Ophthalmology and Otolaryngology; affiliated with the Palo Alto Hospital, where he died December 8, aged 69, of coronary occlusion.

William Evans Lester, Mullins, S. C.; Medical Department of Tulane University of Louisiana, New Orleans, 1911; member of the American Medical Association; served overseas during World War I; a member of the board of health; affiliated with the Mullins Hospital, where he died December 10, aged 60, of cerebral hemorrhage.

Mae Dillard McInnes-Pappas, West Frankfort, Ill.; Hering Medical College, Chicago, 1912; member of the American Medical Association; died December 15, aged 59, of coronary sclerosis.

William Thomas McLean ⊕ Maroa, Ill.; Rush Medical College, Chicago, 1881; an Associate Fellow of the American Medical Association; died December 18, aged 90, of myocardial insufficiency and intestinal obstruction.

Bennett Andrew Melgaard, Sioux City, Iowa; Sioux City College of Medicine, 1908; died December 4, aged 67, of cerebral hemorrhage.

Eliza Johnson Merrick, Syracuse, N. Y.; Homeopathic Hospital College, Cleveland, 1884; died December 14, aged 91, of arteriosclerotic heart disease and carcinoma of the right breast.

George Brinton McClellan Miller ⊕ Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1885; served on the staff of the Episcopal Hospital; died December 6, aged 84.

Benjamin Joseph Moss, Los Angeles; New York Homeopathic Medical College and Flower Hospital, 1910; died recently, aged 61.

Anthony Victor Nanna, New York; Regia Università degli Studi di Roma. Facoltà di Medicina e Chirurgia, Italy, 1937; member of the American Medical Association; served during World War II; formerly on the staff of the Mother Cabrini Memorial Hospital; died recently, aged 35, of rheumatic heart disease.

Charles Leonard Overlander ⊕ Boston; Harvard Medical School, Boston, 1905; fellow of the American College of Physicians; formerly lecturer at his alma mater and at the Tufts College Medical School; served as toxicologist for the Commonwealth of Massachusetts and biochemist for the Industrial Accident Board; for many years affiliated with the Brooks Hospital, Brookline, where he died December 16, aged 75.

Charles Freeman Perry, Block Island, R. I.; University of Pennsylvania Department of Medicine, Philadelphia, 1888; member of the American Medical Association; served on the staff of St. Joseph's Hospital in Providence; died in Wakefield, December 18, aged 80, of carcinoma.

Harry Wray Porter ⊕ Atlanta, Ga.; Tulane University of Louisiana School of Medicine, New Orleans, 1925; member of the Florida Medical Association; associated with the Veterans Administration; served during World Wars I and II; died in Crawford W. Long Memorial Hospital recently, aged 63.

Loring Hay Raymond ⊕ Somerville, Mass.; Harvard Medical School, Boston, 1903; fellow of the American College of Surgeons; on the staff of Somerville Hospital; died recently, aged 69, of cerebral hemorrhage.

William Alfred Ricard, Toledo, Ohio; Toledo Medical College, 1906; affiliated with Robinwood Hospital, where he died December 4, aged 74, of myocardial infarction and pulmonary embolism.

Carrie Elizabeth Rice, Wilton, N. H.; Boston University Medical School, 1900; died in the Sacred Heart Hospital, Manchester, December 1, aged 77, of pneumonia.

James Daniel Roberts, Beech Grove, Ky.; Louisville (Ky.) Medical College, 1907; died December 17, aged 77, of coronary thrombosis.

Samuel Rosenberg, New York; Long Island College Hospital, Brooklyn, 1905; died in Miami Beach, Fla., recently, aged 66, of cerebral hemorrhage.

Walter W. Seibert, Easton, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1900; president of the board of trustees of the Allentown (Pa.) State Hospital; died in St. Petersburg, Fla., December 13, aged 72, of angina pectoris.

Bertha Loveland Selmon ⊕ Battle Creek, Mich.; American Medical Missionary College, Battle Creek and Chicago, 1902; formerly a medical missionary in China; past president of the Michigan Branch of the Medical Women's National Association; died in the Community Hospital January 25, aged 71, of intracranial hemorrhage and arteriosclerosis.

Charles Dodge Slagle ⊕ Dayton, Ohio; Starling Medical College, Columbus, 1897; served during World War I; affiliated with Miami Valley Hospital; died December 2, aged 77, of arteriosclerotic heart disease.

James Davis Smith ⊕ Collingswood, N. J.; Jefferson Medical College of Philadelphia, 1914; served on the staff of Cooper Hospital in Camden; died December 16, aged 69, of cardiac failure.

Oncey H. Smith, Ardmore, Okla.; University of West Tennessee College of Medicine and Surgery, Memphis, 1910; died recently, aged 65.

William Smith, Naples, Texas; Epworth College of Medicine, Oklahoma City, 1909; member of the American Medical Association; died January 16, aged 68.

Lucien Stark ⊕ Norfolk, Neb.; John A. Creighton Medical College, Omaha, 1903; past president of the Nebraska State Medical Association, American Geriatrics Society and the American Association of Railway Surgeons; formerly member of the state board of health; served during the Spanish-American War and World War I; affiliated with the Chicago and Northwestern Railway and the Union Pacific Railroad; died in North Platte January 11, aged 66, of coronary thrombosis.

William Henry Starr, Blue Island, Ill.; St. Louis College of Physicians and Surgeons, 1904; for many years mayor of Crestwood; died December 16, aged 71, of coronary occlusion.

James Alexander Stewart, Brooklyn; New York Homeopathic Medical College, 1885; for many years on the staff of Peck Memorial Hospital; died in St. Agnes Hospital February 9, aged 90.

Harry E. Stowell, Peoria, Ill.; Reliance Medical College, Chicago, 1911; for many years practiced in Chicago, where he was affiliated with the board of health; died December 9, aged 64, of cardiac asthma.

Clinton Clement Straughn, Red Bank, N. J.; Hahnemann Medical College and Hospital of Philadelphia, 1896; member of the American Medical Association; on the staff of Fitkin Memorial Hospital in Neptune; died in Clearwater, Fla., January 24, aged 76, of coronary thrombosis.

Loren Gerald Strauss ⊕ Wooster, Ohio; Western Reserve University Medical Department, Cleveland, 1921; affiliated with Community Hospital; died January 11, aged 53, of hypertension and nephritis.

William Lee Sumners ⊕ Ridgely, Tenn.; College of Physicians and Surgeons, Memphis, 1907; past president of the Dyer, Lake and Crockett Counties Medical Society; died in Methodist Hospital, Memphis, recently, aged 70.

Charles Joseph Swalm ⊕ Philadelphia; University of Pennsylvania School of Medicine, Philadelphia, 1906; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology; coroner's physician; on the staff of Jewish Hospital, where he died January 1, aged 64, of coronary thrombosis.

Arthur Van Dusen ⊕ Astoria, Ore.; Northwestern University Medical School, Chicago, 1914; fellow of the American College of Surgeons; past president of the Clatsop County Medical Society; affiliated with St. Mary's Hospital, where he died January 18, aged 61, of heart disease.

DIED WHILE IN MILITARY SERVICE

John William Anderson, Nashville, Tenn.; College of Medical Evangelists, Loma Linda and Los Angeles, 1938; member of the American Medical Association; interned at the North Hudson Hospital in Weehawken, N. J.; served a residency at Vanderbilt University Hospital in Nashville; certified by the National Board of Medical Examiners; began active duty as a captain in the medical corps, Army of the United States, on June 1, 1942; served with the 69th Bombardment Squadron; died Sept. 10, 1945, aged 33, when his airplane was lost somewhere in the Pacific theater.

Joseph Assiof Corey, Waterbury, Conn.; Université de Genève Faculté de Médecine, Switzerland, 1938; affiliated with St. Mary's Hospital; captain in the medical corps, Army of the United States; died in Halloran General Hospital, Staten Island, N. Y., May 31, 1946, aged 39, of carcinoma of the stomach.

National Health Service Bill Passed in Australia

In 1940 the Australian Government began to prepare a scheme for a National Health Service and with the Australian branch of the British Medical Association entered into negotiations which have gone on ever since, but no agreement has been reached. Unlike the parent body at home the Australian branch rejected the government scheme and made a firm stand against it. The federal parliament has at last passed an act in spite of failure to obtain agreement with the British Medical Association. It provides a complete medical, dental and nursing service for all and medical education and research. Unlike the British service the Australian is not entirely free. The government proposes to pay 50 per cent of the fee charged by the doctor in accordance with a prescribed schedule.

The Australian branch of the British Medical Association wants the control of the service to be in the hands of a corporate body composed predominantly of doctors instead of under a director general of health as proposed by the government. It fears the encroachment of state control over all aspects of medical practice, particularly because the act allows the government to make regulations which would bring the whole medical profession under its complete control. At a meeting of the council it was held that no regulations should be promulgated unless they have first been approved by the corporate body. The council also pointed out that the system by which a doctor is to claim his fees for items of service rendered to patients involves a breach of his confidential relationship to patients. The clerical work and liabilities involved in acting as the agent for the patient in obtaining medical benefit are objectionable to practitioners. They would prefer a refund system by which the patient pays the whole fee to the doctor and claims a refund of half from the government. The council refuses to admit the right of the government to fix a fee of which it pays half.

The position has reached a complete impasse. The Minister of Health stated in a letter to the president of the Federal Council of the British Medical Association that the government has regretfully come to the conclusion that despite the splendid services rendered by the great number of practitioners "your association is grievously lacking in a sense of social responsibility. Having exhausted every endeavor to secure the cooperation of your Association, the Government does not intend that its proposals should be further delayed or frustrated by your Council or Association. I have to convey to you the decision of the Government that, within the limits of its constitutional power, the Government will proceed to put its plans into operation." The *Medical Journal of Australia* has made the comment: "The Government is determined to force on the people a piece of legislation that is foredoomed to failure."

This controversy between the British Medical Association and the government goes back as far as 1940. In 1941 the British Medical Association advocated a scheme providing for every person a general practitioner of his own choice, through whom consultant and laboratory services would be available. In July 1947 it offered to negotiate with the government on the basis of the following principles: (1) control by a corporate body; (2) no contract between the government and individual practitioners, and (3) payment on a fee for service basis. The *Medical Journal of Australia* of February 5 comments as follows: "The members of the medical profession cannot be expected to consent to take part in a service which, according to the expressly stated opinion of the Minister, has as its ultimate aim the abolition of private medical practice—in other words the denial of the freedom of the individual."

Excess of Cost of National Health Service Over Estimate

All the undertakings of the socialist government show one thing with melancholy monotony—increased cost. The official figures, just issued, for the National Health Service are no exception. The cost of doctors is $118,000,000, an excess of $9,200,000 over the estimate. The cost of dentists is $82,800,000, an increase of $54,600,000. The cost of pharmacists is $70,860,000, an increase of $20,000,000 over the estimate. The cost of opticians is $57,800,000, an excess of $15,000,000 over the estimate. A large part of this vast expenditure is wasted, as is so characteristic of socialist finance.

Influenza Epidemic in France

The outbreak of the first cases of the present influenza epidemic in France dates back to Dec. 15, 1948. Apart from some districts in the South, which remained unaffected, on January 10, the whole of the country was involved. The epidemic reached its height on January 10, and, at the same time, the districts which were the first subjected to the epidemic already showed signs of regression. In general, the evolution of this influenza has remained benign, though convalescence has been slow. Complications, mostly bronchopneumonic, did not surpass 10 per cent. Severe, and even deadly, forms have been rarely noted in adults, but, to the contrary, frequent in old persons and infants.

Bacteriologic Researches

As from the onset of the epidemic, the Pasteur Institute has asked the practitioners, in order to facilitate research, to furnish two samples of serum from influenza patients: the first at the beginning of the disease and the second ten to twelve days later. P. Lepine, Chief of Service at the Pasteur Institute, Sautter, R. Reinie and J. Maurin have communicated to the Society of Biology the first results of their researches. In the great majority of cases, there is a virus of group A and especially group A′ which might belong to the same antigenic group as the one isolated in 1947-1948 in England and in the United States.

R. Panthier, Mrs. Cataigne and C. Hannon have communicated to the Academy of Sciences the results of their researches concerning a strain named D. 48, isolated from the washings of a patient with severe influenza. The culturing has been effected through the amniotic route, in the fertilized egg. The authors have also demonstrated the possibility of growing this virus directly in the white mouse. The serologic study, made with experimental serums, has shown that this strain is not identical with the classic ones: A.PR 8, AWS or B. Lee. In the patient's blood, from which D. 48 has been isolated, the authors have noted, by the end of the disease, antibodies against this strain and also the absence of antibodies against classic strains. Andrewes has also observed in it antibodies against strain A 47 isolated in England. The authors have inoculated 2 young Cercopithecus monkeys, one with 0.5 cc. of the virulent allantoic fluid, the other with the same quantity of this fluid diluted ten times. The first inoculated monkey, on the point of dying, was killed forty hours after the inoculation. Autopsy showed a discolored liver, lung congested with a beginning of hepatization of a lobe. The fluid of the bronchial washing contained, besides numerous polymorphonuclear leukocytes, large cells with a central nucleus filled with small vacuoles, similar to those found in the liquid of the tracheal washing of a 2 year old child who had died of pulmonary edema in the course of this epidemic. The second monkey, killed, when sick, three days after the inoculation, showed the same alteration in the liver; in the lung was edema with lardaceous hepatization, and in the bronchial washing there were numerous cells similar to the ones found in the infant patient.

Compulsory Vaccination in Certain Private and Public Institutions

The beginning of a smallpox epidemic, observed in 1947, and the effectiveness of a massive vaccination performed during this period have suggested to the Minister for Public Health the establishment of a new regulation for a compulsory vaccination against variola, typhoid, paratyphoid A and B, diphtheria and tetanus. This new law, published in the *Journal Officiel* on January 21, includes the public and private benevolent institutions for prevention or treatment, all sanitary services, nurseries, kindergartens, laboratories for medical analysis and the services of control at frontiers. All persons employed in any of these establishments are to be revaccinated within six months; persons having temporary or definitive medical contraindications are provisionally or definitely exempted. A special list is to be kept in each of these establishments and is to be presented when required by the control authorities.

Restoration of Professor Roussy's Good Name

The Academy of Sciences, and recently the National Academy of Medicine, have proposed that the name of Professor Gustave Roussy be given to the Villejuif Cancer Institute in order to perpetuate the memory of this great scientist, who died so tragically. The examination of the file concerning his case has revealed that the serious accusation made against him before the Civil Jurisdiction was groundless. In this way the Academy of Sciences and the National Academy of Medicine (of which he was perpetual secretary) desired to rehabilitate the name of Professor Roussy, late Vice-Chancellor of the Paris Academy.

Trouble Over National Health Insurance

Under a system of national health insurance, doctors in Norway are paid out of the insurance fund so many kroner for every consultation in the surgery, for every visit to a patient and for traveling expenses according to a scale of charges which varies with the mode of conveyance—motorcar, motorboat or "the Apostles' horses." Up to 1925, the insured patient paid the doctor nothing for these items. Since then he has had to pay a certain fraction of them himself, to ease the insurance fund directly and, by discouraging unnecessary consultations, indirectly. No one wishes to go back to the days when a doctor was often in doubt over what, if anything, to charge his poorer patients.

But what battles have been fought with the health insurance authorities by the Norwegian Medical Association over scales of charges! With the enormous rise in the cost of living, it was obvious that there must be a parallel, if not equal, rise in the doctor's charges. After much discussion agreement was reached on April 1, 1948, when it seemed that every one was satisfied with the new scale designed to meet some at least of the rise in the cost of living. But the Government had afterthoughts over the concessions made to the association, and it was recently announced that, as from Jan. 13, 1949, a new scale would be imposed on the doctors as a Government order. One of the most important differences between the two scales is that the latter fixes a hard and fast upper limit of charges, whereas the scale of April 1 was to be regarded merely as a guide to charges under ordinary conditions. Under extraordinary conditions these charges could be raised. The association has declared the Government's proposed action to be illegal and has threatened to go to law over it.

The conflict now shifted to Parliament, the Storting debating it in February with a certain liveliness. During the debate, the country's legislators were given ample opportunity to say all the nice and other things they thought about their doctors. On behalf of them one speaker pointed out that a specialist with an international reputation could hardly be expected to keep his charges within the narrow limits of the Government's new scale. On the other hand, it was argued that the legal action threatened by the association was a sign of arrogance on the part of a profession wishing to be in a class by itself, objecting to the restrictions imposed on all other members of the community. The word "dictatorship" was bandied about, and the debate ended in a unanimous recommendation to the Government to resume negotiations with the association. This means that there will now be a searching investigation of the justice of the claims of the association.

Whither the Practice of Medicine in Norway?

In a document recently issued, the Norwegian Labor Government has let it be known what it would like to plan for the future with regard to the health of the nation. It would like every patient to enjoy free medical treatment and to be free to choose his doctor. It would like the doctor to be paid in such a way that his income did not depend on the sickness of a given patient. In other words, it would prefer the English system of a fixed annual sum for every insured person instead of the present Norwegian system. It would also like to control the distribution of doctors so that sparsely populated areas do not suffer for lack of medical skill. The Government is also anxious to develop a system of remuneration which would stimulate doctors to keep the quality of their work up to a high standard.

Unfair Taxation of Young Doctors

With a logic reminiscent of Columbus and his egg, the Norwegian Government has introduced a tax the object of which is to pocket most of the rise in the capital value of its citizens during World War II. The war profiteer, active or passive, was to disgorge. This tax, so admirable in theory, hits many a young doctor hard. Let us take the medical student who had just qualified as a doctor early in 1940, and who started life with no capital. During the war his work might give him no hospital training, of which he was badly in need, but he was able to put by several thousand kroner which he earmarked for future postgraduate study spread over several years during which he would earn next to nothing. Is it surprising that he feels annoyed when the tax collector claims his savings?

An Asthma Survey

The Norwegian Association of Physicians appointed a committee early in 1948 to investigate asthma problems in Norway. According to the report recently issued by this committee there are no accurate figures concerning the frequency of this condition, but one of the committee's members has calculated that in Norway, with a population of a little over 3,000,000, there are some 12,000 persons with asthma, among whom there are about 700 adults entirely unfit for work on account of this disease. The others are more or less invalids. The committee reports on the available hospital accommodation for persons with asthma and recommends a much more systematic handling of the asthmatic person's problems than hitherto. It is suggested to general practitioners that, while they continue to treat asthmatic persons, they would be well advised to invoke the aid of specialists in this field. For some two-thirds may achieve prolonged freedom from symptoms or at any rate considerable improvement if they can enjoy the benefits of up-to-date treatment given systematically and with due reference to the special needs of each case.

Correspondence

ANTABUS® FOR ALCOHOLISM

To the Editor:—As you know, a new approach to the medical management of alcoholism was recently reported in the Scandinavian as well as the British literature (*Acta pharmacol. et toxicol.* 4: 285-321 [Dec.] 1948; *Lancet* 2: 1001 [Dec. 25] 1948). The substance used was antabus,® a highly purified brand of tetraethylthiuramdisulfide specially prepared by Medicinalco, Copenhagen, Denmark. Antabus® is capable of producing pronounced physical discomfort when it is taken prior to the ingestion of alcohol and tends to create in the alcoholic patient a disinclination to drink. On this basis, its value as an adjunct to recognized psychotherapeutic measures has been suggested (*Lancet* 2: 1004 [Dec. 25] 1948).

Because of the sociologic significance of this development, widespread interest has been aroused by the publicity which antabus® has received in the United States. This letter is sent to you with the thought that it may provide a means of informing the medical profession of the status of antabus® in this country.

Ayerst, McKenna & Harrison, Limited, have recently concluded arrangements with the Danish pharmaceutical firm, Medicinalco, for rights to manufacture and distribute antabus® in the United States.

Antabus® is considered a "new drug" under the terms of the Federal Food, Drug and Cosmetic Act of 1938, and cannot be released nationally for prescription use until the requirements of the Act are met.

In order to obtain the clinical and pharmacologic data necessary to comply with the regulations of the Food and Drug Administration, a series of controlled studies have been inaugurated, or are in the process of being established, in a selected number of institutions and clinics devoted to the study and treatment of alcoholism throughout the United States.

In view of the overwhelming number of requests for investigational material received from the medical professional at large, distribution must, of necessity, be restricted to the institutions or groups of investigators providing the most favorable conditions for the evaluation of the therapeutic effectiveness and toxic properties of antabus® on an extensive scale.

We are sorry that we cannot take advantage of all the offers of clinical assistance we have received, nor are we able to provide supplies of antabus® for investigational studies other than those which are scheduled within the present economy of this project. The cooperative understanding of the many physicians whose requests must be turned down is therefore solicited.

J. Murray Scott, M.D.
Medical Director,
Ayerst, McKenna & Harrison, Ltd.,
New York.

DETECTION OF DIABETES

To the Editor:—In regard to the most interesting letter of Dr. R. W. Brown of Ogden, Utah, regarding the advisability of placing into the hands of the laity a simple test for glycosuria to facilitate early and widespread detection of diabetes mellitus (The Journal, February 12, page 474), as Secretary of the American Diabetes Association I should like to call attention to the fact that this fascinating proposal is not new and has recently been called to the attention of the Council of the American Diabetes Association by the profession itself. It has been advised that just as the clinical thermometer, given by the profession to the laity, has been well used by the latter, so might a simple test for glycosuria made available to the entire population by the medical profession serve to break the problem of finding the unknown million persons with diabetes in this country. It has been pointed out that such a step would have such far reaching public health implications as to serve as one more concrete evidence *that the medical profession* is rightfully a custodian of the health of the people.

The plan presented for consideration by the Council of the American Diabetes Association was that manufacturers of simple tests for glycosuria be invited to present their products to the American Diabetes Association for use in connection with its year-round drive for detection of diabetes. One or more simple tests meeting the needs for rapid, easy determination of urine sugar, it was suggested, should be approved by the association. The publicity suggested was: "Are you one of the Unknown Million Diabetics in America? See your doctor or test your own urine by a simple method recommended by the American Diabetes Association! Ask your druggist." It was further suggested that these individual tests be sold at a small price over the drug counter. If the clinitest® type of tablet as suggested by Dr. Brown were used there would be included in each package printed suggestions: "Pass urine one and one-half hours after a heavy meal; if any color other than blue develops it means you have sugar or a sugar-like substance in your urine. *See your doctor for a diagnosis.* Remember that sugar in the urine does not necessarily mean that you have diabetes. Only your doctor, with the aid of further laboratory data, can evaluate the situation and make a diagnosis. This is a test only for sugar in the urine." It was alleged that the doctors and clinical pathologists of this country would see thousands of persons who presently do not know they have diabetes. The profession would be in a position to fight the disease in its early and possibly reversible stages or, at least, before any of the dire complications had developed. A by-product of the individual testing would be the stimulating of the patient to seek further health examination; to wit, "This is a test only for sugar in the urine."

The American Diabetes Association is an arm of the medical profession. All of its organized drive activities to find the unknown million persons with diabetes have to date been undertaken only in communities where the respective county medical societies have given their full approval. Under no conditions would the association depart from its policy of working for the common good, entirely through the channels of medicine.

The association would at this time invite not only editorial comment but also the point of view of the rank and file of the profession of which it is a part.

It is hoped that the following questions will be answered by the medical profession:

1. Should one or more such simple tests for glycosuria sponsored by organized medicine be placed in the hands of the public?

2. Would it be constructive for public health that the test for glycosuria in relation to diabetes be made analogous to that of spot roentgenographic surveys in tuberculosis detection?

3. Should the American Diabetes Association further explore and foster this proposed service?

Dr. Brown's letter is most timely and provocative. It is up to organized medicine to express itself in this matter.

George E. Anderson, M.D.,
Secretary, American Diabetes Association,
1 Nevins St., Brooklyn.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I and II.* Various Centers. June 20-22, Sept. 12-14. *Part II.* April 25-26. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology, Inc. *Written.* Various Centers. July 15: Final date for filing application is April 15. *Oral.* April 10-14 and Oct. 16-20. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Ave., New York 27.

American Board of Dermatology and Syphilology: *Oral.* New York City, April 1-3. Sec., Dr. George M. Lewis, 66 East 66th Street, New York 21.

American Board of Internal Medicine: *Oral.* Philadelphia, June 1-3. *Written.* Oct. 17. Final date for filing application is May 1. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

American Board of Neurological Surgery: *Oral.* Chicago, June 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

American Board of Obstetrics and Gynecology, Inc.: *Oral.* Chicago, May 8-14. Final date for filing application is April 1. Sec., Dr. Paul Titus, 1015 Highland Building, Pittsburgh 6.

American Board of Ophthalmology: *Oral.* New York, June 11-15; St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

American Board of Orthopaedic Surgery. *Part I.* New York City, April 22-23; Atlanta, Ga., April 29-30; Indianapolis, May 6-7 and Denver, May 13-14. *Part II.* New York City, Jan. 1950. Final date for filing application for Part II is Aug. 15. Address: Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14, Calif.

American Board of Otolaryngology: New York, May 11-14; Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

American Board of Pathology: Boston, April 12-13. Sec., Dr. Robert A. Moore, 507 S. Euclid Ave., St. Louis 10, Mo.

American Board of Pediatrics: *Oral.* Baltimore, May 7-9. Exec. Sec., Dr. John McK. Mitchell, 6 Cushman Rd., Rosemont, Pa.

American Board of Physical Medicine. Atlantic City, June 4-5. Sec., Dr. R. L. Bennett, 30 N. Michigan Blvd., Chicago.

American Board of Plastic Surgery: Examinations are given in June and November of each year in the home town of applicants. Sec.-Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

American Board of Preventive Medicine and Public Health: Washington, D. C., May 14-16. Sec.-Treas., Dr. Ernest L. Stebbins, 615 North Wolfe St., Baltimore.

American Board of Psychiatry and Neurology, Inc. December, New York City. Sec., Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

American Board of Radiology. Atlantic City, June 2-4. Sec., Dr. B. R. Kirklin, 102-110 Second Ave., S.W., Rochester, Minn.

American Board of Surgery: *Written.* Various Centers, October 26. Final date for filing application is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

American Board of Urology: Feb. 1950. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination.* Montgomery, June 28-30. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

Arkansas: * Little Rock, June 9-10. Sec., Dr. L. J. Kosminsky, Texarkana. *Eclectic.* Little Rock, June 9-10. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

California: *Examination.* San Francisco, June 20-23. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento.

Colorado: * *Endorsement,* Denver., April 5. *Written,* Denver, June 20-22. Sec., Dr. W. W. King, 831 Republic Bldg., Denver 2.

Delaware: Dover, July 12-14. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

District of Columbia: * *Written,* Washington, May 9-10. Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., Washington.

Florida: * *Examination,* Jacksonville, June 26-28. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

Georgia: *Examination.* June 8-9, Atlanta and Augusta. *Reciprocity.* Atlanta, June. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

Guam: *Endorsement.* Agana, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam. % F.P.O., San Francisco, Calif.

Hawaii: * *Examination.* Honolulu, July 11-14. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu.

Idaho: Boise, July 11-13. Sec., Miss Estella S. Mulliner, Bureau of Occupational Licenses, 355 State House, Boise.

Illinois: Chicago, April 12-14. Supt. of Registration, Mr. Fred W Ruegg, Capitol Bldg., Springfield.

Indiana: *Examination.* Indianapolis, June 21-23. Sec. Board of Medical Registration and Examination. Dr. Paul R. Tindall, 416 K. of P. Bldg., Indianapolis.

Iowa: * *Examination.* Iowa City, June 13-15. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

Kansas: Kansas City, June 1-2. Sec., J. F. Hassig, 905 North 7th St., Kansas City, Kans.

Kentucky: *Examination.* Louisville, June 15-17. Sec., Dr. Bruce Underwood, 620 S. 3rd St., Louisville 2.

Maryland: *Examination.* Baltimore, June 21-24. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homeopathic.* Baltimore, June 14-15. Sec., Dr. John A. Evans, 612 West 40th St., Baltimore.

Minnesota: * Minneapolis, April 19-21. Sec., Dr. J. F. Du Bois, 230 Lowry Medical Arts Bldg., St. Paul 2.

Mississippi: Jackson, June 21-22. Asst. Sec., Dr. R. N. Whitfield, State Board of Health, Jackson.

Missouri: *Examination.* St. Louis, May 30-31 and June 8-10. Exec. Sec., Mr. John A. Hailey, Box 4, Jefferson City.

Montana: Helena, April 4-6. Sec., Dr. O. G. Klein, First National Bank Building, Helena.

Nebraska:* *Examination.* Omaha, June 6-8. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9

Nevada: Carson City, May 2. Sec., Dr. G. H. Ross, 112 N. Curry Street, Carson City.

New Jersey: *Examination.* Trenton, June 21-24. Sec., Dr. E. H Hallinger, 28 West State Street, Trenton 8.

New Mexico: * Santa Fe, April 11-12. Sec., Dr. V. E. Berchtold, 141 Palace Ave., Santa Fe.

New York: Albany, Buffalo, New York and Syracue, June 28-July 1, Sec., Dr. Jacob L. Lochner, 23 South Pearl St., Albany.

North Carolina: *Endorsement.* Pinehurst, May 9. *Examination* Raleigh, June 23-25. Sec., Dr. Ivan Procter, 226 Hillsboro St., Raleigh.

North Dakota: * *Written,* Grand Forks, July 5-7. *Reciprocity,* Grand Forks, July 8. Sec., Dr. C. J. Glaspel, Grafton.

Ohio: *Endorsement.* Columbus, April 5. *Written.* Columbus, June Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

Oklahoma: * Oklahoma City, June 8-9. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

Oregon: * *Endorsement.* Portland, April 29-30. *Examination.* Portland, July. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg., Portland.

Pennsylvania: *Examination.* Philadelphia and Pittsburgh, July. Acting Sec., Mrs. B. G. Steiner, 351 Education Bldg., Harrisburg.

Puerto Rico: San Juan, Sept. 6-10. Sec., Dr. Luis Cueto Coll, Box 3717, Santurce.

Rhode Island:* *Examination.* Providence, April 7-8 and July 7-8. Chief, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

South Carolina: *Examination.* Columbia, June 27-29. *Endorsement.* Columbia, March 7, April 4, May 2, June 27-28, Aug. 1, Sept. 5 and Oct. 3. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

South Dakota: * *Examination.* Pierre, July 19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

Texas: *Examination.* Austin, June 16-18. Sec., Dr. M. H. Crabb. 209 Medical Arts Bldg., Fort Worth 2.

Utah: *Examination.* Salt Lake City, July. Sec., Dept of Registration. Miss Rena B. Loomis. 324 State Capitol Bldg., Salt Lake City.

Virginia: *Examination.* Richmond, June 17-18. *Reciprocity.* Richmond. June 16. Dr. K. D. Graves, 631 First St., S.W., Roanoke.

Washington: * Seattle, July. Sec., Mr. Edward C. Dohm, Department of Licenses, Olympia.

West Virginia: Charleston, April 7-9. Sec., Dr. N. H. Dyer, State Capitol, Charleston 5.

Wisconsin: * *Examination.* Milwaukee, June 28-30. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

Wyoming: Cheyenne, June 20. Sec., Dr. Franklin D. Yoder, Capitol Bldg., Cheyenne.

---

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Arkansas: *Examination.* Little Rock, May 3. Sec., Mr. L. E. Gebauer, 1002 Donaghey Bldg., Little Rock.

Colorado: *Examination.* Denver, June 1-2. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver.

Connecticut: New Haven, June 11. Exec. Asst., State Board of Healing Arts, Miss Mary G. Reynolds, 110 Whitney Ave., New Haven 10.

District of Columbia: *Examination.* Washington, April 18-19. Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., Washington.

Florida: *Examination.* Gainesville, June 11. Sec., Mr. M. W. Emmel, University of Florida, Gainesville.

Iowa: *Examination.* Des Moines, April 12. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: *Examination.* Detroit and Ann Arbor, May 13-14. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing 15.

Minnesota: *Examination.* April 4, June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

Oklahoma: April 15. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

Oregon: Portland, June 18, Sept. 3 and Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

South Dakota: Vermillion, June 3-4. Dr. G. M. Evans, 310 E. 15th St,. Yankton.

Tennessee: Memphis, July 8-9. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis 3.

Wisconsin: Milwaukee, June 4. Sec., Prof. W. H. Barber, Ripon College, Ripon.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Heart Journal, St. Louis

36:641-800 (Nov.) 1948

*Amount of Digitoxin (Digitaline Nativelle) Required for Adequate Digitalization. H. J. Stewart and A. A. Newman.—p. 641.
Continuous Observations of Arterial Oxygen Saturation at Rest and During Exercise in Congenital Heart Disease. G. E. Montgomery Jr., E. H. Wood, H. B. Burchell and others.—p. 668.
Coronary Artery Disease in Men Eighteen to Thirty-Nine Years of Age: Report of 866 Cases, 450 with Necropsy Examination. W. M. Yater, A. H. Traum, W. G. Brown and others.—p. 683.
*Clinical Evaluation of Veratrum Viride in Treatment of Essential Hypertension. E. D. Freis and J. R. Stanton.—p. 723.
Effect of Posture Upon Axis Deviation in Human Bundle Branch Block. A. M. Jones and H. Feil.—p. 739.
Determination of Levo- and Dextrocardiogram. M. Segers.—p. 751.
Further Experience with Thromboangiitis Obliterans in Women. S. Silbert.—p. 757.
Case of Paradoxical Embolism. C. A. Ross and P. H. Sprague.—p. 772.
*Extreme Bradycardia: Report of Case Exhibiting Ventricular Rate of Less Than Twelve per Minute. J. C. Doane and S. O. Krasnoff.—p. 777.

Amount of Digitoxin for Adequate Digitalization.—In their studies on digitoxin Stewart and Newman chose patients with auricular fibrillation because the slowing of the ventricular rate is a satisfactory guide to digitalis effect. Their investigations were made on 26 patients and included two phases: (1) The hospital records of all patients from 1942 to 1946 having auricular fibrillation who received digitoxin were reviewed to ascertain the effect of this drug on ventricular rate, and (2) observations were made on the amount of digitoxin required to produce full digitalization in patients with auricular fibrillation. The average amount of digitoxin required for adequate digitalization in this series was around 2.0 mg. if given in twenty-four hours. There is no difference whether the drug is given in one single dose or in divided doses. When adequate slowing of the heart is attained, nausea and vomiting occur more frequently with digitoxin than with the whole leaf. The average maintenance amount of digitoxin is between 0.1 and 0.2 mg.; 0.2 mg. is too much in most patients who have been adequately digitalized. It is more difficult to keep patients in equilibrium by maintenance doses of digitoxin than with the whole leaf. Although large amounts of the drug in a single dose were given in this series of patients *in order to arrive at the digitalizing amount in twenty-four* hours, this procedure is not recommended for general use. Since digitalization with divided doses of digitoxin is effective in patients with auricular fibrillation, the same system of dosage can be transferred to patients with normal rhythm in whom the heart rate does not serve as a guide. In hyperthyroidism with auricular fibrillation, larger amounts of digitoxin are required to achieve slowing of the ventricular rate than in patients with normal basal metabolic rates, an experience which is similar to that observed when the whole leaf is used.

Veratrum Viride in Hypertension.—Freis and Stanton report the results of a clinical trial of Veratrum viride in 40 patients with hypertension. The substance was administered orally in the form of the whole powdered mixture of alkaloids. When the drug was administered by the oral route, the hypotensive effect began to appear at the end of one or two hours, reached a maximum in four or six hours and largely disappeared by the end of fourteen hours. In order to obtain maximum therapeutic benefit and to avoid toxic reactions resulting from cumulative overdosage, the drug was administered at dosage intervals of twelve hours. In addition, in order to provide greater therapeutic safety, this dosage interval was further subdivided so that no more than 10 Craw units were ingested per hour. The great variability of response to a given dose in different persons required the gradual increase of dosage in each patient in order to avoid toxic side effects. Veratrum was found to be a useful therapeutic agent in the treatment of patients with (*a*) "hypertensive crisis," (*b*) severe long-standing hypertensive disease which proved resistant to other forms of treatment and (*c*) hypertension complicated by cardiac failure. Prolonged therapy in some cases resulted in a diminution in cardiac size and reversal of electrocardiographic changes toward normal. There were no deaths and no toxic reactions resulting in more than transient disability. However, the development of side effects and of changing sensitivity to a given dose were sufficiently frequent to limit its usefulness in the treatment of patients with mild or moderate degrees of hypertension. Veratrum viride appeared to have therapeutic value as an adjunct to dietotherapy and to the routine treatment of hypertensive heart disease.

Extreme Bradycardia.—Doane and Krasnoff present a patient with complete heart block whose ventricular rate during the last twelve hours of his life varied from 12.5 to 9.8 beats *per minute. The probable causative pathologic factor* was calcific deposits involving the auriculoventricular node and the right and left branches of the bundle of His. It appeared that ephedrine was a useful drug in increasing the ventricular rate and in lessening the frequency of the Stokes-Adams syndrome. As far as the authors have been able to discover, this patient *exhibited the slowest ventricular rate ever recorded by the* electrocardiograph in man.

Adenocarcinoma of Uterine Fundus in Identical Twins. J. P. Palmer and R. W. Mitchell.—p. 981.

Elderly Primiparas.—Geittmann and his associates report a study of elderly primiparas, 35 years of age and over, taken from the records of St. Luke's and Cook County Hospitals in Chicago, Ill. The cases from Cook County are those of charity service and those from St. Luke's are predominantly private cases. The patients were pregnant seven months or more and had viable babies on admission to the hospital. Elderly primiparas occur five times more frequently in the private series than on a charity service. Breech presentation occurred twice as often in elderly primiparas as in all cases. Only one multiple pregnancy and one shoulder presentation occurred in 417 cases of elderly primiparas. The maternal death rate was 0.46 per cent in elderly primiparas at St. Luke's as compared with 0.2 per cent in all cases, while at Cook County it was 0 per cent as compared with 0.15 per cent in all cases. Corrected fetal mortality was 0.9 per cent and 3.94 per cent, respectively, at St. Luke's and Cook County hospitals, as compared with 1.3 per cent and 2.04 per cent in all cases. Preeclampsia, hypertensive toxemia and fibroids are the most common complications of pregnancy in elderly primiparas. Prolonged labor occurred in 23.3 per cent of the elderly patients at St. Luke's and 12.8 per cent at Cook County. Postpartum hemorrhage occurred more frequently in elderly primiparas at St. Luke's, where there was a higher operative incidence. Approximately 80 per cent of the elderly primiparas will deliver vaginally and 75 per cent of these with short or average labors. The cesarean section rate was 18.2 per cent at Cook County and 22.4 per cent at St. Luke's, as compared with 2 per cent and 4.4 per cent in all cases.

Peptic Ulcer and Pregnancy.—Bernstine and Friedman report 3 cases which indicate that if progesterone is administered to pregnant women to prevent threatened abortion there is likelihood that if the woman has a history of peptic ulcer the ulcer may become aggravated. Duodenal ulcer occurs less frequently in women than in men and is a rare complication of pregnancy. In women known to have had peptic ulcer, its symptoms almost always disappear with the advent of pregnancy. In the 3 reported cases, the history suggested or proved the existence of an ulcer prior to pregnancy. The ulcer symptoms abated during the early stages of the pregnancy in all 3 women; yet the later administration of progesterone was followed in each case by an aggravation of the ulcer, by hemorrhage and a stormy course almost terminating fatally. An endocrine basis has been suggested for peptic ulcer and investigators have reported beneficial effects with gonadotropin. The relationship between progesterone and gonadotropin is such as to indicate possible antagonism between them. The beneficial effect of gonadotropin on peptic ulcer would suggest the adverse action of progesterone.

Theory and Technic of Simultaneous Tomography. M. de Abreu.—p. 668.

Calcified Omental Fat Deposits.—Holt and MacIntyre observed several patients in whom roentgenograms of the abdomen have shown confusing areas of calcification. They cite 4 cases. The deposition of calcium salts in omental fat is probably the result of (1) local interference with blood supply, (2) inflammatory or traumatic pancreatic fat necrosis, or (3) any infectious process causing caseation necrosis. Neither calcified omental fat deposits nor calcified epiploic appendages have a typical roentgenographic appearance. Like pathologic calcification of fat occurring in many other portions of the body, these abdominal concretions are round or oval in shape, and have a greater concentration of lime salt in their outer margins than in their central portions. This feature is of little value in differentiating omental fat deposits from gallstones and fecaliths of appendix and small intestine, but it is helpful in excluding urinary tract calculi, calcified lymph nodes, and other forms of intra-abdominal calcifications which have a different and sometimes characteristic roentgenographic appearance. One of the most instructive features is the great mobility of the greater omentum. Omental calcifications have been identified roentgenographically in widely separated regions of the abdomen within a relatively short span of time.

Postirradiation Neuropathy.—Greenfield and Stark report on 180 cases of carcinoma of the testis treated with intensive million volt roentgen therapy to the retroperitoneal node-bearing area following simple or radical orchectomy. The use of roentgen rays generated at 1,000,000 volts made possible the delivery of much larger doses to the retroperitoneal nodes and adjacent deep tissues than had been previously employed. In 3 patients a peculiar neurologic disturbance developed. They showed a strikingly similar clinical picture. The first muscular weakness in the lower extremities was noted from three to five months after completion of the roentgen therapy. Progression was slow but continuous for about one year, with tendency for the condition to level off and become stationary after that time. There was a flaccid paralysis of the lower extremities without sensory loss. The chief site of nerve injury was believed to be the anterior horn cells in the lumbosacral segments of the spinal cord.

Vagotomy in Treatment of Gastric Crises of Tabes Dorsalis. C. W. Stoops Jr., L. S. Markson, J. M. Sullivan and J. Kanter.—p. 599.

Treatment of Late Symptomatic Neurosyphilis.—Kopp and his co-workers treated 394 patients with neurosyphilis with penicillin at the Boston Psychopathic Hospital from February 1944 to March 1948. Three hundred and five of the patients had dementia paralytica. Penicillin alone in 3,000,000 or 6,000,000 unit dosages over a period of five to fifteen days was administered to 94 patients, and penicillin combined with fever to 300 patients. Fever treatment was given in amounts equivalent to one half of the usually accepted course. Thirty-two patients died, but in only 16 (4 per cent) can death be attributed to the syphilitic process. Twenty-four patients (6 per cent) have been lost to clinical follow-up. Of 274 living patients followed one year or more, 170 (62 per cent) have improved. The clinical syndrome is of considerable importance in the therapeutic results obtained. Of 59 nonpsychotic paretic patients 50 (85 per cent) have improved. Of 211 psychotic patients 117 (55 per cent) have improved, with improvement ranging from 12 (25 per cent) in 48 patients with schizophrenic-like syndromes to 18 (90 per cent) in 20 patients with manic-depressive types. These factors must be taken into consideration when comparing the result of treatment from different clinic groups. Penicillin administered over a fifteen day period and combined with fever therapy gave better clinical results than when given for ten days or less. Clinical improvement resulted in 37 (71 per cent) of 52 patients in the former category and in 46 (58 per cent) of 79 patients in the latter. No significant difference was observed when 3,000,000 or 6,000,000 units of penicillin was used. Retreatment was more frequent when penicillin alone was used, 28 (52 per cent) of 54 patients, in contrast to 45 (21 per cent) of 219 patients to whom combined fever and penicillin was given. Retreatment was more frequent when 3,000,000 units of penicillin was used with or without fever. A short course of malaria therapy when added to penicillin given over a fifteen day period is equal to or superior to any treatment thus far known in late symptomatic neurosyphilis.

Results in Neurosyphilis Treated with Penicillin Alone.—The report by Stokes and his co-workers is the fifth in a series presented by the University of Pennsylvania on the treatment of neurosyphilis with penicillin alone. In some of the total of 537 cases the fourth year has now been reached, and longer. The results of the serial examinations of spinal fluids and parallel clinical data sustain the record of the third year in this series and show a recognizable increase in the proportion of normal, near normal and markedly improved spinal fluids obtained over previous reports. Forty-six per cent of paretic, 60 per cent of taboparetic and 80 per cent of tabetic patients with type III spinal fluids now have normal or near normal spinal fluids. Sixty per cent of patients with meningovascular syphilis and 74 per cent of those with asymptomatic neurosyphilis have a similar status. Like the results presented in 1946, though to an even greater degree, these figures suggest that penicillin is superior to other forms of treatment for all types of neurosyphilis and certainly entitled, on the scores of safety, convenience and effectiveness, to first choice.

Treatment of Neurosyphilis with Penicillin Alone and with Malaria.—From a total of 539 patients with neurosyphilis who have been treated with penicillin alone or with penicillin and malaria, 223 were followed by Curtis and his co-workers for one year and 104 of these for two years after treatment. Patients with asymptomatic neurosyphilis, meningovascular syphilis and tabes dorsalis respond as well to a regimen of penicillin alone as to one of penicillin and malaria. This response was apparent in both the clinical evaluation and spinal fluid improvement of these patients. Patients with paresis and taboparesis responded as well in the clinical evaluation of their symptoms to penicillin alone as they did to a combination of penicillin and malaria. The latter regimen retains a slight superiority after two years of observation, if the improvement of the spinal fluid is used as the sole index of comparison. A longer period of post-treatment observation seems indicated before any final conclusion can be drawn regarding the efficacy of penicillin alone in the treatment of this group. The response of patients with the several types of neurosyphilis seems to be more rapid when the combination of penicillin and malaria is used. Even in taboparesis and paresis, there are indications that penicillin therapy alone will eventually prove as effective as its combination with malaria therapy. Treatment with penicillin alone is far less hazardous.

Archives of Ophthalmology, Chicago

Cotton Sutures in Ophthalmic Surgery. J. W. Henderson.—p. 545.

Atrophy of Optic Nerve Due to Malnutrition.—Eissler presents the histories of 2 patients who had atrophy of the optic nerve probably as the result of severe malnutrition while they were prisoners of war for several years during the war in the Philippines. Detailed histories show that the visual difficulties were concurrent with other symptoms of vitamin deficiency and that the visual disturbances improved with an improvement in the diet. No attempt is made to determine lack of which vitamin may have caused the atrophy of the optic nerve or to determine whether the atrophy of the optic nerve was due to a primary disturbance in the ganglion cells of the retina, to optic neuritis or to retrobulbar neuritis. The author reviews the literature on the relation between vitamin deficiencies and optic nerve atrophy and suggests that this complication of malnutrition may be commoner now than the literature has indicated in the past. This greater frequency may be incident to the severe malnutrition to which some American prisoners of war were subjected.

Radiation Therapy of Tonsils and Adenoids.—Uhlmann and his associates believe that if temporary or permanent contraindications exist to tonsillectomy, such patients can often be treated by the application of radiation therapy. During the last ten years more than 1,500 patients received roentgen therapy for recurrent colds, throat infections, cervical lymphadenopathy, impaired hearing and other symptoms associated with an enlargement of the tonsils, or with the existence of hypertrophic lymphoid tissue in the pharynx, in the Tumor Clinic of Michael Reese Hospital. In order to evaluate the results obtained in these patients the authors have checked on 600 patients treated between 1938 and 1942. Of these 480 could be traced and examined. The average dose used was 125 r to each field in each treatment, both fields being treated the same day. The treatment was repeated twice in weekly intervals so that the total amount of radiation was given within two weeks, with a total of between 450 to 900 r, measured on the skin to two fields. This amount of radiation is a relatively small dose and well below the skin erythema dose. Reviewing the results obtained, the authors say that 25 per cent of all patients had a complete cessation of the symptoms for which they were treated, and 45 per cent had so much improvement that they were considered well. Almost one fifth of these two groups, who represent 70 per cent of the total number, underwent tonsillectomy without appreciable benefit before they were referred for radiation therapy. Of all patients in this study 16.6 per cent showed only temporary improvement, but in many instances this proved to be valuable, since the patients remained clinically well. In other instances, tonsillectomies which could not be carried out before radiation therapy now became feasible and improved the patient's condition. In 13.3 per cent radiation therapy proved to be a complete failure, but many of these patients offered poor prospects for any form of therapy since they include patients suffering from a status allergicus with hay fever, asthma, skin diseases and other symptoms; more than 50 per cent of them never were considered for surgery. In instances in which all the anatomic structures of the tonsils are hypertrophic, as is frequently the case in children, radiation therapy can be expected to be successful. If repeated infections of Waldeyer's ring with sore throats and cervical lymphadenopathy are present, radiation therapy is indicated and in most instances preferable to surgery.

Hospital Crowding and Insurance.—Ballantyne and his associates studied the relationship between hospitalization insurance and present hospital crowding. It was found that the utilization of hospital facilities by insured groups is essentially the same as the general average for the population, although the insurance subscribers are recruited from the section of the population with low morbidity rates. Between 30 and 40 per cent of patients in public general hospitals are 60 years of age or older and few of this group are covered by insurance. On the basis of representative figures on utilization of hospital facilities of the insured group as compared with the average and the difference in the age composition of the two groups, it seems justifiable to conclude that the use of insurance as a means of paying hospital bills does increase the utilization of service beyond that expected of uninsured persons. This finding should hardly be unexpected, as it is one of the purposes of the insurance principle to allow people to go to hospital who might not otherwise be able to defray the expense of this form of treatment.

Utilization of Collapse Therapy: Report of Sub-Committee on Non-Surgical Collapse Therapy. H. G. Trimble.—p. 906.

Pulmonary Hemorrhage.—Abbott reports 1,316 patients, 724 men and 592 women between the ages of 7 and 87 years, with thoracic disease, 497 of whom had suffered pulmonary hemorrhage, with frank hemoptysis in 318, scant or streaking in 174 and with bleeding of undetermined degree in 5. Cough as a primary symptom occurred in 62 per cent of the cases, while hemoptysis was noted only in 21 per cent. Hemoptysis predicates serious underlying disease in 90 per cent of the patients presenting it and demands immediate and intensive investigation. Percentage incidence of bleeding in individual diseases was observed as follows: Bronchogenic carcinoma leads with 53.60 per cent, while lung abscess has 49 per cent, pulmonary infarct 44 per cent, bronchiectasis 45 per cent and tuberculosis 36.5 per cent. The relatively higher incidence in bronchogenic carcinoma, bronchiectasis and lung abscess than in pulmonary tuberculosis is stressed. The occurrence of bleeding with mediastinal lesions and tumors metastatic to the lung is emphasized. Attention is called to the importance of any variation from the usual type of hemoptysis seen in "acute pneumonia" and the need for investigation to rule out possible underlying neoplasm. No correlation can be made between the type of hemoptysis and the underlying disease, other than a tendency to more copious hemorrhage in patients with pulmonary abscess. The importance of the patient's subjective localization of the bleeding site is stressed. With the addition of staining methods for the study of tumor cells in the sputum and the intelligent use of exploratory thoracotomy, a decrease in the group of hemoptysis of undetermined causation is to be expected.

Streptomycin in Tuberculous Meningitis.—Bauer and Sauer report a man, aged 34, with tuberculosis of the right lung and proved tuberculous meningitis. Pronounced clinical improvement resulted from initial treatment with streptomycin. When the drug was discontinued for five days in the third month of treatment, the patient suffered a severe relapse. Renewal of treatment with streptomycin barely staved off a fatal termination, but after four additional months of treatment the patient progressed to a point where it was deemed feasible to discontinue the drug. He received about 160 Gm. of streptomycin in seven and one-half months by the intramuscular and intrathecal routes. His course after discontinuation of the treatment was marred by one relatively short, self-limited episode of ascites and an attack of acute appendicitis for which an appendectomy was performed. Symptomatic treatment played a large part in combating the disease. Headache and haziness of vision persisted for several months after streptomycin was discontinued but eventually disappeared completely. Ataxia and high tone deafness still persist. The patient seems to be adequately compensating for his vestibular dysfunction. All during his illness and up to the present time he has been receiving pneumothorax refills. The chest lesion shows no change and the sputum is still negative. Twenty-two months have passed since the onset of his disease, the last six of which he has spent at home with no ill effects.

Androgens in Pelvic Cancers.—Chaney and Greenblatt treated 5 women between the ages of 43 and 80 years, 3 with primary ovarian carcinoma, 1 with metastatic breast carcinoma to the ovaries and 1 with sarcoma of the uterus, by pellet implantation or intramuscular injection of 650 to 2,200 mg. of testosterone. Treatment with androgens proved of value as a palliative measure in these cases of pelvic cancers. The improvements noted were both physical and psychologic. There was temporary remission of pelvic pain, some decrease in the size of the tumor masses, improvement in well-being, increase in weight (9 to 20 pounds [4.1 to 9.1 Kg.]) and a lessened need for narcotics and sedatives. Physiologic effects, such as cessation of menstruation, hypertrichosis, deepening of the voice, increase in libido, enlargement of the clitoris and atrophic changes in the vaginal smear were usually noted. Benefit lasted from several months to almost one year in these hopeless cases. If testosterone so administered offers surcease from suffering to the patients the trial is worth the effort. The optimum dosage of the drug has not been decided on, but from these preliminary studies it is evident that greater dosage for longer periods may offer much more.

What Is the Best Treatment for Early Syphilis? A. M. Buchholz. —p. 1170.

Gastric Cancer.—Gates believes that every patient past 35 years of age who has digestive complaints which are in the least suggestive of gastrointestinal disease must be given roentgen examination at once. The average duration of symptoms before these patients visit the doctor is six months. The average time after this first visit before a correct diagnosis is made has been found to be nearly another six months; routine roentgen studies would do away with this. However, even then, the lesions will often have spread beyond the confines of the stomach. The most common complaint is that of vague epigastric discomfort or distress, associated with, or even followed by, disturbances of appetite and slight nausea. If the lesion is at the pylorus, these symptoms may be early vomiting, and if near the cardia, hiccoughing following eating. Eating generally aggravates the distress, in contrast to the peptic ulcer syndrome, but about 30 per cent of cases show a typical ulcer reaction, with relief by eating. The unwary physician who treats this group by diet and antacids without roentgen studies will lose for these patients their chance of cure. Gastroscopic examination may be of help in doubtful cases, and now there is also cytologic examination of the gastric secretion according to the method of Papanicolaou. The cases in which cancer is apt to be present but which justify two weeks of therapeutic trial and reexamination are those with a large crater, those with irregular contour of the niche and those with a lesion on the lower half of the lesser curvature, especially if on the posterior wall. The ones warranting surgical exploration without therapeutic trial are cases with the meniscus sign, lesions of the greater curvature, subtraction defects associated with an ulcer and the presence of an achlorhydria in any location.

*Possible Effects of Streptomycin Upon Airman's Future. P. A. Campbell.—p. 393.

High Altitude Hypoxia.—From the large collection of cases in the files of the Army Institute of Pathology in which death occurred at high altitudes, Lewis and Haymaker selected those due to hypoxia. These numbered 75. The subjects were members of heavy bomber aircrews whose ages varied from 19 to 33 years. All were apparently in excellent health before the hypoxic episodes. The information regarding the oxygen check interval and the time the men were without supplemental oxygen was obtained from the surviving crew members. Altitudes at which death occurred are known in 70 cases. Flights at altitudes between 17,000 and 30,000 feet (5,180 and 9,140 meters) were in progress when 59 of these deaths occurred and between 30,000 and 31,500 feet (9,600 meters) for the remaining 11. The average altitude was 27,000 feet (8,230 meters). The most common cause of oxygen failure was separation of the quick disconnector between the mask hose and the regulator hose. The second most common cause of oxygen deficit was freezing of moisture in the mask. In 4 instances the oxygen system was shot away by enemy fire. Defective oxygen equipment could be held responsible for the fatal hypoxia in two others. The exact duration of the hypoxia is known in only 6 cases: less than three minutes in 4 and from five to six minutes in 2. The outstanding pathologic changes were (1) engorgement of systemic veins and passive congestion, edema and hemorrhage of the internal organs, (2) vacuolar changes with or without inclusions in cells of internal organs, especially the heart and liver and (3) reactive changes in leptomeningeal histiocytes, extravasation of lymphocytes into perivascular spaces of the brain and acute ganglion cell changes in the brain.

Streptomycin and an Airman's Future.—Campbell is concerned with the vestibular disturbances resulting from the prolonged administration of streptomycin. He makes the plea that streptomycin be used in flying personnel only after due consideration has been given to the possible effect such administration may have on the airman's future. If it is possible to substitute some other drug or biologic product, it should be done. If an airman has had streptomycin he should have a careful evaluation of his vestibular system before he is allowed to resume his occupation.

Contact Reporting by Merchant Seamen. Rosalie Giacomo and J. W. Rion.—p. 371.

Juvenile Delinquency and Venereal Disease.—Ingraham and Burke state that in Philadelphia one fifth of the syphilis and gonorrhea cases detected occur in children under 20 years of age. Of the 5,839 cases discovered in public school children in Philadelphia between 1945 and 1947, ages 13 through 15 accounted for 10 per cent of the cases. In ages 16 through 19, the frequency of detection increased with age, the years 18 and 19 accounting for more than half of the total cases. Syphilis and gonorrhea are reported with almost equal frequency in school age children. Venereal disease is reported somewhat more often among young girls than among young boys. In the senior high school age group, those who remain in school have only about one half of the venereal disease rate of the age group as a whole, and there is a greater expectancy of venereal disease among children retarded in school. The rate of occurrence of venereal disease in the delinquent group (through 17 years of age) is four times greater than the reported rate in the upper three years of high school. Teaching children sex hygiene is insufficient to prevent exposure. Problems associated with venereal disease and juvenile delinquency are individual ones which would be difficult to solve by any mass approach. In addition to what may be done by parents and by the church, the trained school counselor should be made available to help with this problem.

Prevention and Treatment of Deafness in Children. E. La Monte Gann and LaVerne B. Spake.—p. 462.

Surgical Repair of Irradiation Defects.—Robinson points out that, since the beginning of treatment by roentgen-ray and radium, injuries have been known to result from such therapy. Unpreventable sequelae of heroic treatment have been justifiable; however, injuries do result from overenthusiasm, ignorance and negligence. Persons with relatively benign skin lesions have been given a few roentgens in successive treatments over many weeks or months only to have years later the inevitable skin lesions of radiodermatitis which are immeasurably worse than the original condition. The treatment of these lesions should be surgical. He presents 4 cases to illustrate the different methods of repair employed for (1) accidental irradiation burns of physicians, (2) injury from intentional massive dosage for neoplasm, (3) late change from repeated small dosage given for superficial therapy and (4) burns to patients from prolonged exposure under the fluoroscope. The surgical technics for different structures and different locations are discussed, and special warnings are emphasized concerning the frequency of malignant change and of the difficulty of controlling infections in irradiated tissues.

Argyria Following Prolonged Intranasal Medication with Mild Silver Protein.—Reviewing the literature on generalized argyria, Fisher and Zukerman discuss the history, clinical data, methods of acquiring the skin condition, differential diagnosis and treatment. They also present Stillians' list of the causes of argyria in industry and in therapy. The case they report concerns a woman, aged 39, who, when first seen in April 1946, complained of a bluish discoloration of the skin which she had noticed for approximately one year. In 1923 she had "bronchial trouble" which persisted for twenty years. When the "bronchial trouble" first began she was advised to use 10 per cent mild silver protein (argyrol®) to clear the secretions from her nose and throat. She continued the use of this medicine intermittently over a fifteen year period. About eight years ago, she was advised by a second physician to continue the use of 10 per cent mild silver protein. She used it daily, morning and night, for approximately two years, requiring about an ounce of the drug every ten days to two weeks. In 1940 she began to use it at occasional intervals, and since 1943 she had ceased the use of silver salts. She exhibited slate blue appearance of the face, lips, buccal mucosa, chest wall, abdomen and back. The legs and thighs also presented a slate blue color but of less intensity. Biopsy revealed silver granules in the basket cell layer and tunica propria of the sweat glands, in the blood vessel walls and in the corium immediately beneath the epidermis. A lesser number were seen scattered through the corium. There has been an increase in argyria since silver salts have again become popular, through the fact that manufacturers claim that organic preparations of silver do not cause abnormal skin pigmentation. The authors feel that it cannot be emphasized too strongly that large doses of silver salts over a short period of time or repeated small doses for prolonged periods will cause argyria.

Disfigurement by Acne Pits.—McEvitt, not being a dermatologist, does not attempt to treat the active acne. He is concerned with the acne pits, the residuum of the disease. Only when the disease is quiescent can the residual scars be treated by the plastic surgeon. Dekeratinization with some caustic such as trichloracetic acid, although still a valuable procedure in some cases, has come into disrepute because it has been misused by charlatans. In the author's program, abrasion by means of sandpaper is the most important feature. This is carried to the point of profuse capillary bleeding, after which a grease gauze dressing is applied and left in place for seven to ten days. When the dressing is removed, the area is found to be epithelialized. Large pits and sinuses are excised and mounds pared as a preliminary procedure. The anesthesia is local. Abrasion is continued from one affected area to the next until all are treated. Second, and sometimes third, operations are required over a given area. In these multistage cases, two to three months are allowed to elapse between operations on the same area. Extremely recalcitrant scars may require even more stages, but this is unusual. No case has been found to be hopeless; some improvement has always been gained.

*Disturbances of Nails Produced by Base Coats. C. W. Laymon and E. M. Rusten.—p. 1218.

Disturbances of Nails Caused by Base Coats.—Laymon and Rusten point out that physicians are observing a new disorder of the nails produced by base coats, which are applied directly to the nails beneath ordinary nail polish to prevent the latter from chipping and to reduce the frequency of application. Base coats have been on the market for several years, but in 1947 new formulas were introduced. One of the most striking changes produced by base coats is the discoloration, which may vary from magenta to different shades of brown. The nails are much drier than normal; they become brittle, and some present longitudinal striations. Another important feature is the deposition of hyperkeratotic material beneath the nail which leads to varying degrees of onycholysis. Most cases which have been observed by physicians who are not acquainted with this disorder have been diagnosed as psoriasis or onychomycosis. There have undoubtedly been many millions of applications of the newer base coats; yet the reactions have been relatively few. For this reason it seems that the material must not be a primary irritant and that persons who have this type of disturbance must be hypersensitive to some ingredient in the base coat. The positive reactions to patch tests with base coats in persons who present these changes suggest that there is an actual contact dermatitis of the nail bed. The accumulation of hyperkeratotic material beneath the nail causes onycholysis and, in same cases, complete shedding of the nail.

Vascular Disease and Hypertension.—In 1943 Castleman and Smithwick reported on renal biopsies from 100 hypertensive patients in the course of splanchnic resections for hypertension. The degree of the vascular disease of these patients was divided into five grades of advancing severity. Twenty-eight of the patients showed no or insignificant vascular disease and an additional 25 only mild changes. It was concluded that in many of these patients the hypertensive state antedated the renal vascular lesions, which, once established, probably aggravated the hypertension. Conclusive evidence that biopsy material provides an adequate basis for conclusions regarding the degree of arteriolar disease in hypertensive patients is presented by the authors as follows: Approximately the same percentage of cases for each biopsy grade was present in a series of 500 hypertensive patients as in the first series of 100 patients. The majority of these 500 patients were between the ages of 30 and 50, but 61 were under 30. In 100 of the 500 patients biopsies were taken from both right and left kidneys and in 95 per cent the degree of vascular disease for all practical purposes was identical on both sides. In this group of 100 double biopsies 40 patients had minimal or no arteriolar disease on each side. There was good correlation between the biopsy grades and renal function as measured by the phenolsulfonphthalein test in the entire series of 500 patients and in 20 patients when compared with renal plasma flow values. There was fairly good correlation between the biopsy grades and the retinal vessel changes when applied to the lowest and highest grades. Of the 61 patients less than 30 years of age 38 had minimal or no renal vascular disease. Two hundred and twenty-eight (45.6 per cent) of the entire series of 500 patients had minimal or no vascular narrowing. It must be concluded, as in the previous report, that hypertension frequently exists in man without evidence of renal vascular disease or with insufficient evidence to explain the elevated blood pressure. Some other functional factors that are primarily responsible for the hypertensive state and precede the appearance of renal vascular disease must exist in many cases.

Diabetes Mellitus.—According to Beaser, true onset must be sharply separated from the clinical onset of diabetes. Only 34 per cent of a group of 182 adult patients with diabetes had classic diabetic symptoms as presenting complaints at the time of diagnosis. Diabetic symptoms of any type could be elicited from only 77 per cent of all the patients under consideration. Diabetic complications were shown to be in a different category from the symptoms and were the presenting complaints of only 19 per cent. There was a lower incidence of severe diabetic symptoms with increasing age. Severity, as measured by insulin requirement, seemed to be correlated with untreated prior glycosuria, metabolic decompensation and age, in order of decreasing importance. Single negative urinalyses are of practically no value for the exclusion of diabetes mellitus. Isolated asymptomatic glycosuria, regardless of a negative reaction to a fasting blood sugar test, should be considered diabetic unless a glucose tolerance test proves the contrary. In 56 of 100 patients of the author's group who were found to have had one or more urinalyses prior to diagnosis, glycosuria had been noted up to sixteen years prior to definite diagnosis. Glycosuria preceded symptoms by two to eleven years. Detection and treatment in the earliest, hyperglycemic or glycosuric stages of the disease is urged to prevent progression of severity of complications.

Electroconvulsive Therapy.—Kaldeck and his co-workers report 628 patients with mental diseases who received 8,082 electroshock treatments at the Boston State Hospital during the period 1942 to 1947. Thirty-one of them were aged over 60 and 5 over 70. All these patients responded well to the treatment, as did a child aged 11. One patient aged 23, with paranoid schizophrenia, died eighteen hours after the eighth treatment in a second series of electroshock treatment. Necropsy revealed acute glomerulonephritis, emphasizing that patients suffering from acute infections should be excluded from electroshock treatment and that every effort should be made to discover intercurrent infections prior to and during a course of electroshock. A thorough physical examination of every patient preceded the electroconvulsive therapy, including roentgenograms of the chest, urinalysis, blood count, blood sugar and nonprotein nitrogen determination, sputum examinations, sedimentation rate and electrocardiogram. Definite contraindications were observed to be rare. About 50 patients had signs of cardiovascular disease. In many of these patients the increased blood pressure went down when agitation subsided as a result of electroshock treatment. In a few other cases the blood pressure went up or up and down in a way that was not always consistent with the patient's emotional state. Eight patients with active and 25 with arrested pulmonary tuberculosis were treated in this series. Shock treatment of mental patients with tuberculosis carries definite risks, but in selected cases it has to be given even if the tuberculosis is active. If there is a history of recent hemorrhage or if the activity is high, shock should be given only when the pulmonary process has been controlled by collapse therapy. Eleven cases of fractures due to electroshock treatment were observed; 2 of them occurred in patients who had bone disease prior to the treatment. All fractures healed without permanent damage. A few patients with disease of the central nervous system were treated without ill effects. In another patient, who had no observed physical abnormalities prior to electroshock treatment, a transient hemiplegia developed after the treatment, most likely on the basis of vascular spasm, causing reversible structural damage to parts of the brain.

Solar Burns of the Fundi.—Turtz observed 5 cases of burns of the retina during the past four years. Three were seen within a few days after exposure to strong sunlight. The other 2 were seen four to six hours after exposure to sun lamps. All 5 complained of pain, photophobia and lacrimation, and all had conjunctival injection to a varying degree several hours after exposure. An early examination with the ophthalmoscope may reveal nothing pathologic, or a pale spot, surrounded by a brownish ring, may be seen at the fovea. Later, there may be pigment deposits and a small gray punctate spot around the fovea, and this may be replaced by a hole. The prognosis should be guarded. Even though improvement may occur, a positive scotoma with permanent impairment in vision usually results. The public should be enlightened as to the dangers of prolonged exposure to sunlight and the careless use of sunlamp treatments without adequate protection to the eyes.

*Radiologic Demonstration of Ascaris Infestation. C. Strang and C. K. Warrick.—p. 575.

Roentgenologic Demonstration of Ascaris Infestation.—Strang and Warrick point out that roentgenologic methods are rarely necessary to diagnose the presence of roundworms in the bowel, and the searching for the ascaris ova in the stools is simpler and more reliable. When, however, the presence of worms has been overlooked clinically, and other diagnoses such as peptic ulcer, carcinoma or gallbladder disease are being considered, roentgenograms may show roundworms to be the cause of symptoms. Exceptionally, male worms may be present without females, so it is not justifiable to presume the absence of worms if the examination of the stools for eggs yields a negative result in a suspicious case. The roundworms show as sharply outlined, band-shaped or cylindric defects in the barium shadow of the small intestine. The barium may adhere to the surface of the worm so that its outline is visible. Sometimes a thread-like shadow indicates that barium has entered the enteric canal of the parasite. The presence of worms may lead to irritability and disordered motility of the bowel. The authors present a case which showed all these features.

*Treatment of Abortus Fever with Sulfonamides and Blood Transfusions. J. MacD. Holmes and R. Hughes.—p. 859.

Sulfonamide Drugs and Blood Transfusions in Undulant Fever.—A report on 4 cases of undulant fever which responded quickly to sulfonamide drugs together with blood transfusions induced Holmes and Hughes to try this treatment in 2 patients both of whom had failed to respond to previous treatment. The first patient had failed to respond to penicillin and the second one to penicillin and sulfamethazine® (2-sulfanilamido-4,6-dimethylpyrimidine) or sulfadiazine. In both of these patients there was rapid response to sulfadiazine and small blood transfusions. The second patient returned three weeks later with acute cholecystitis due to Brucella abortus; the temperature did not subside after cholecystectomy but responded to further sulfadiazine and blood transfusions. The authors feel that these results are encouraging and that this method of treatment should be given a more extended trial.

Causalgia.—Slessor reports on the late results of sympathectomy for causalgia in a series of 28 patients out of 670 with peripheral nerve injury. Sympathectomy relieves the burning pain of causalgia; in 17 patients so treated there has been no recurrence of this pain two to three years after operation. Subsidiary pains may persist, although diminished in intensity. In some cases repeated procaine block of the appropriate sympathetic chain affords relief. Two patients so treated have remained free of pain for three years. Slight sympathetic activity in the limbs, result of faulty operative technic or of regeneration, has not been associated with recurrence of symptoms. Three untreated persons still have causalgia, which is gradually diminishing, although emotional and environmental stimuli continue to aggravate the pain.

Method of Testing Analgesics. R. Asher.—p. 771.

Disinfection of Clean Unwashed Skin.—Gardner says that rapid disinfection of unwashed skin, experimentally infected with bacteria, has been investigated in a previous inquiry, which showed that 2 per cent iodine in 70 per cent alcohol disinfected more rapidly than any of the other substances tested. The author presents further investigations on this problem which confirmed the power of 2 per cent iodine in 70 per cent alcohol to achieve virtual disinfection of flat areas of unwashed clean skin in 30 seconds or less. It is shown also, that, if a full 30 seconds is allowed, the iodine may be reduced even to 0.5 per cent. The detergents, benzalkonium chloride 30 per cent and cetrimide® (cetyltrimethyl ammonium bromide) 10 per cent, both in 70 per cent ethyl alcohol, give satisfactory disinfection in 30 to 45 seconds. Ethyl ether, various mercury preparations and some other substances have either a slower or an otherwise imperfect disinfecting power.

Flow of Venous Blood Measured with Radioactive Sodium.—According to Wright and his associates venous thrombosis has long been known to be influenced by three main factors, commonly known as Virchow's triad—changes in the constitution of the blood, damage to the blood vessels and disturbances of the circulation. Though the first two of Virchow's three factors are now well established, the participation of the third has hitherto remained largely inferential. The introduction of radioactive tracers has made possible the direct measurement of the rate of blood flow in a limb by introducing such a tracer at one point and determining its arrival at some other point with a suitably placed Geiger-Müller counter. The authors measured the rate of venous blood flow in the leg by means of radioactive sodium (Na^{24}). Studies were made on 121 normal persons most of whom were in the age group from 20 to 30 years. The flow time was measured with the subject in the supine position, care being taken to insure that the foot was at the same level as the heart and that the head was not raised. The subjects were rested for at least twenty minutes under a warm electric blanket so that their foot temperature approximated as nearly as possible that of patients in bed—i. e., 33 C. (91.4 F.). To see whether skin temperature had any pronounced effect on the foot-groin time, 10 persons were examined on two occasions, first in the way just described and again with the foot and leg immersed to the knee for twenty minutes in a water-bath at 45 to 48 C. (113 to 118.4 F.). A prominent vein on the dorsum of the foot was selected for injection with 1 cc. of solution of radioactive sodium chloride ($Na^{24}Cl$). The mean foot-groin flow time under standard conditions was 18 plus or minus 0.9 second. The extreme range of the observations was 4 to 50 seconds. The results obtained in the 10 persons examined in the standard manner and again after vasodilation by immersion in hot water showed no significant change. Significant changes had been observed by other investigators when the skin temperature rose from 20 to 33 C. (68.0 to 91.4 F.). The authors believe that this apparent difference in results might be due to the fact that their lower temperature of 33 C. was already rather "warm" and probably had evoked considerable vasodilatation and that little further change took place when the temperature was raised to 45 C. It is to be assumed that a greater vasodilatation might result when the temperature is raised from 20 to 33 C., as had been done by the other investigators. The observed range of flow times in the present series of normal persons under standard conditions of rest and temperature has shown a wider variation than was expected by comparison with the recorded figures of other workers. It is suggested the much larger range observed in this study might be due to the sensitivity of the method.

*Injuries of Hand: Their Conservative Treatment. T. Schrire.—p. 634.
Electrocardiographic Case Book. III. A. Landau.—p. 645.
Radiologic Case Book. IX: Adenocarcinoma of Bronchus and Aneurysm of Aorta. M. Findlay.—p. 646.

Injuries of Hand.—After citing statistics on the tremendous industrial losses, in the form of man-work-days lost, as the result of injuries to the hand, Schrire discusses the management of these injuries. He cites the following as fundamental principles: 1. The minimum of tissue must be sacrificed; there are no spare parts in a hand. 2. Fibrous tissue strangles function and to prevent its formation infection must be fought at all stages of treatment. 3. Hand skin is the best skin for hands. 4. A loosely sutured skin has the best chance of survival. The technic described is simple and has been tested in almost 2,000 cases. Freeing of hands that are caught in machinery should be done, if possible, by reversing gears and by disassembling parts, to recover everything that has passed in without resorting to needlessly high amputations. The best anesthetic for such a procedure is thiopental sodium, because of its portability and convenience. The author discusses hemostasis, debridement, repair of nerves, joints and tendons, and amputations. After the surgical treatment penicillin should be given for forty-eight hours. The hand is kept elevated for twelve to twenty-four hours to reduce bleeding. After that it is placed in a sling. The plaster and the stitches are removed after twenty-one days. Physical therapy in the form of diathermy and active movements is carried on as long as improvement is taking place. When improvement ceases, the physical therapy is discontinued or altered.

*Calciferol in Treatment of Tuberculous Glands. Suzette Gauvain.—p. 259.

Calciferol for Tuberculous Lymph Nodes.—Gauvain reports 23 children between the ages of 3 and 15 years and 11 adults between the ages of 16 and 44 with tuberculous cervical and inguinal lymph nodes treated with calciferol. The dosage given to most children has been 100,000 units of vitamin D daily, chiefly in dry tablet form by mouth. The adult dose is 150,000 units daily. The total dosage for children varied from 2,000,000 to 16,000,000 units of vitamin D and depended entirely on the child's reaction. The minimum adult dosage has been 7,000,000 units and the maximum 46,000,000 units. The early effect of calciferol is to cause a flare-up of activity, followed generally by rapid healing, which is usually of such a sound degree that the lymph nodes can be immediately and, so far as one can tell at this early stage, safely excised with little risk of recurrence. Of the 14 children with sinuses in this series three were slow to respond, the others all healed soundly and fairly rapidly in periods varying from one to three months. Of the 6 adults with sinuses, 3 healed within three months, 2 within six and 1 in twelve. In 6 of the 7 patients whose lymph nodes have not been excised, the lesions have remained satisfactorily healed; 1 in whom the disease has again become active has been readmitted for excision. The great advantage of calciferol appears to be that it speeds up treatment, quiescence occurs more quickly, and, therefore, surgical treatment may safely take place at an earlier stage. Surgical excision is greatly facilitated by the calciferol, as the lymph nodes are discrete and well calcified. It is as an aid rather than as a replacement of surgical treatment that calciferol appears to have its biggest part.

Antagonistic Action of Methylthiouracil on Inhibitory Effect of Thyroxin on Serum Lipase. G. Klein.—p. 248.

Hormonal Disturbances and Mental Disease.—Leth Pedersen discusses mental symptoms in association with endocrine lesions. He suggests that certain mental disorders may have an endocrine etiology. He is concerned particularly with women, giving an account of studies concerning patients with lesions in or about the hypothalamus and women castrated by operation. Both groups of patients show symptoms of emotional instability and increased irritability, but these are not identical in the two groups. The patients with hypothalamic lesions show, in addition to emotional instability, decided egocentricity, with a tendency to be hard to please, inert and despairing, whereas women who have undergone castration do not show these tendencies, but are restless and inclined to minimize their symptoms.

Urinary Excretion of 17-Ketosteroids in Women.—Furuhjelm found her modification of the Zimmermann reaction highly satisfactory in the determination of 17-ketosteroids in that it is simple and gives about the same results as do other methods. In studies on a large series of healthy women she has obtained insight into cyclic variations in the excretion of 17-ketosteroids. She also determined the content of 17-ketosteroids in 29 women with more or less pronounced virile traits and in 6 patients with Cushing's syndrome. Discussing observations on fertile women she says that in earlier investigations she had observed a certain tendency toward parallelism between the excretion of estrogenic substances and of 17-ketosteroids in normal women. Unlike the estrogenic excretion, the excretion of 17-ketosteroids showed no regular, pronounced peak in the middle of the cycle, nor did it reach exceptionally low levels during menstruation. The curve representing the normal women seems to show a tendency toward higher levels during the secretory phase. Among women with virilism, the highest 17-ketosteroid levels were found in those with most pronounced virile symptoms; in those with milder symptoms they were within the range of normal variations, irrespective of whether menstruation was normal. Three of the 6 patients with Cushing's syndrome showed an increased 17-ketosteroid level.

*Viscous, Water-Soluble Contrast Preparations: Preliminary Report. O. Morales and H. Heiwinkel.—p. 257.

Tomography as Adjunct to Urography.—Andersen says that since July 1947 it has been the practice at the radiologic service of the Central Hospital for Frederiksborg County to use tomography of the kidney region as a supplement to the usual urography, in order to obtain more distinct nephropyelograms free from the disturbing shadows often caused by the presence of feces and gas in the intestinal tract. The author describes the technic and analyses the results obtained in the first 100 cases. He considers tomography particularly helpful in cases in which bowel preparation cannot be undertaken and the amount of gas in the intestine is abnormally increased, and in patients with prostatic hypertrophy, a condition which is often associated with flatulence.

Late Reaction After Irradiation of Hypopharynx.—At periodic follow-up examinations of patients who had been treated by irradiation for cancer of the hypopharynx, Welin observed delayed changes in 5 cases. They consisted in increased width of the prevertebral soft tissue shadow and a renewed occurrence of irregularity of the mucous membrane. These changes, although radiologically indistinguishable from a local recurrence, disappeared without further treatment. All clinical examinations with regard to the presence of a recurrence also remained negative. These changes are presumably caused by a late reaction after irradiation or they may be reaction of the irradiated tissue to an infection.

Water-Soluble Contrast Medium.—After citing some of the disadvantages in the use of iodized oils as contrast mediums, Morales and Heiwinkel say that after several years of trials they have succeeded in developing a water-soluble contrast medium of high viscosity which is free from irritating effects. The contrast substance they use is iodopyracet injection U.S.P. Sodium carboxymethylcellulose (called CMC) is a cellulose ether made by the reaction of monochloracetic acid with alkali cellulose. Its sodium salt is easily soluble in water and, at concentrations as low as 1 to 3 per cent, forms highly viscous solutions which are completely clear and colorless. They do not gelatinize, even on storing, and are completely non-irritant. To avoid pain during injection 0.25 per cent xylocaine hydrochloride® (omega-diethylamino-2,6-dimethylacetanilide hydrochloride) is added as anesthetic. The compound used by the authors contained 35 per cent of iodopyracet, 2.5 of the carboxymethylcellulose and 0.25 per cent of xylocaine.® The proportions of the constituents can be modified to suit the purpose of the examiner.

*Pneumoencephalography: A Contribution to Psychiatric Semiology. A. Silveira, C. Pereira da Silva and M. Robortella.—p. 5.

Pneumoencephalography in Psychiatric Diagnosis.—Silveira and collaborators performed pneumoencephalography in 50 unselected hospitalized patients with mental disease. The patients were between the ages of 15 and 70 years. Forty cases are reported in detail. The authors found that pneumoencephalography is of great topographic diagnostic value and is well tolerated. To evaluate adequately its reliability as a localizing test in psychiatry it is important that the psychiatric diagnosis be focused on the localizing meaning of the symptoms, and not on the etiologic or nosologic meanings. Encephalographic alterations ~~suggest~~ neuropsychic symptoms of the "localizing" kind. If the psychiatric pattern of a given patient has a "localizing" feature and consists of symptoms bearing on more than one cerebral region, the encephalogram may follow two different patterns: Either the changes cover the region supposed to be involved or they may also show involvement of distant areas as a secondary effect. Such behavior may be predicted if the localizing pattern is considered in the light of chronologic factors. Such alterations do not mean that all the symptoms must be labeled as originated by lesions: Many may have been evoked at a distance as a functional effect. A normal encephalogram does not contradict a localizing diagnosis by itself. The fact must be borne in mind that the symptoms refer to functions and these may be distorted by dynamic involvement.

*Experiences with Penicillin. H. Assmann and H. Moormann.—p. 461.
Problem of Endocarditis lenta; Clinical, Pathologic, Bacteriologic and Therapeutic Contributions. A. Walter, Gertrud Reimold and L. Heilmeyer.—p. 467.
Q(ueensland) Fever in Germany. E. Heni and W. D. Germer.—p. 472.
Chronic Familial Methemoglobinemia and New Modification of Methemoglobin. H. Hörlein and G. Weber.—p. 476.
Defense Against Disease and Antiallergic Principle of Spleen. E. Schliephake.—p. 478.

Experiences with Penicillin.—Assmann and Moormann treated with penicillin 500 patients with bacterial diseases, 30 with disease caused by Streptococcus, 25 by Streptococcus viridans, 56 by Staphylococcus, 32 by Pneumococcus, 5 by Meningococcus and 352 with mixed infections. Three hundred and sixteen patients recovered, 64 were improved and in 120 the treatment was a failure. Administration of the drug by intramuscular route every three hours was preferred. The single doses of the drug varied from 10,000 to 200,000 units and the total doses from 100,000 to 30,000,000 units. The favorable results obtained abroad in diseases caused by Streptococcus and Staphylococcus were confirmed. In contrast to reports published hitherto, a permanent cure of endocarditis lenta, even after treatment with a total dose of 15,000,000 to 30,000,000 units of penicillin, must be considered exceptional, only 1 in 25 patients having recovered. Combined treatment with penicillin and sulfonamide compounds is recommended for meningitis caused by Pneumococcus. Complete cure resulted in 99 of 129 patients with sepsis of various types, in postoperative and post-traumatic infections and in cases of paranephritic abscess. The favorable effect of penicillin on pleural empyema and on empyema of joints and of frontal sinuses, on tuberculous abscesses with mixed infection and occasionally on peritonitis is stressed. In 1 case of agranulocytosis penicillin by intramuscular route and in 2 grave cases of abscess of the lung penicillin spray proved effective and life saving. Penicillin should not be considered a panacea. One should be cautioned against its unlimited use because of the gradually developing resistance to the drug and for economic reasons as well.

*Experimental Investigations on Treatment of Tuberculosis with Combination of Streptomycin with Para-Amino-Salicylic Acid or with Diamino-Diphenyl-Sulfone-N-Acetate. S. Moeschlin, G. Jaccard and M. Bosshard.—p. 535.

Addison's Disease in Diabetes Mellitus.—Doetsch reports a woman, aged 57, who was treated with insulin and, after Addison's disease had been diagnosed, with desoxycorticosterone. She died after an attack of purulent cholecystitis, which proved refractory to chemotherapy. Necropsy revealed sclerosis of the endocrine glands with severe atrophy of both adrenal glands and atrophy and fibrosis of the pancreas. Observations on the case presented here differ from those reported in the literature. Whereas in this case the diabetes was unfavorably influenced by Addison's disease and was improved after administration of desoxycorticosterone, cases reported earlier have shown the opposite behavior, and experimental studies on pancreatectomized animals and on animals with diabetes due to alloxan have shown a similar behavior, in that adrenalectomy improved the diabetes and administration of desoxycorticosterone intensified it. However, other authors have observed a noticeable increase in sugar tolerance after treating a number of diabetic patients with desoxycorticosterone and deduced from this a synergism of pancreas and adrenal cortex. The reported case seems to support this assumption.

Streptomycin With Para-Aminosalicylic Acid in Tuberculosis.—Moeschlin and his associates describe animal experiments which indicate that in the clinical application, likewise, a combination of streptomycin and para-aminosalicylic acid or of streptomycin and diaminodiphenylsulfone-N-acetate will give better results in the treatment of tuberculosis than the treatment with streptomycin alone. This possibility seems the more probable since it has been demonstrated by experiments in vitro that para-aminosalicylic acid has a strong bacteriostatic effect on human strains of tubercle bacilli, which have developed resistance to streptomycin. This suggests that the two substances have two different points of attack. The evaluation of the efficacy of this combined application in human subjects will require further clinical investigations.

Presse Médicale, Paris

56:825-840 (Nov. 27) 1948

*Can Primary Thrombosis Be Localized at Orifice of Vena Cava? Problem of Thrombectomy for Phlebitis: Thrombosis and Stasis. R. Leriche.—p. 825.

Note on Development of Deficiency in Weight and in Height of Children of School Age Since 1944. Douady, J. Trémolières, Matruchot and G. Pequignot.—p. 826.

Is Hysterical Anesthesia Real Anesthesia? J. Boisseau.—p. 827.

Thrombectomy for Phlebitis.—Leriche reports a case he first considered as one of phlebitis of the left external iliac vein in a man aged 46 who presented edema of the left lower limb and of the lower abdominal wall. The latter edema could be related to thrombosis of the vena cava or to stasis in the epigastric and circumflex iliac veins as a result of thrombosis of the external iliac vein. Incision of the iliac vein revealed stasis but no thrombosis, suggesting that the primary lesion was phlebitis localized at the junction of the iliac vein and the vena cava. The femoral vein appeared to be thrombosed and therefore was exposed and incised. It was filled with clots of jelly-like appearance. These clots did not adhere to the walls of the vessel. Four to 5 cm. of the vein was resected. Microscopic examination of the resected venous segment suggested that the lesions were secondary to a general disturbance of the circulation. The edema of the abdominal wall disappeared and the left leg improved, but ten days after the operation some pain occurred in the right calf and discrete pretibial edema developed. There was mild stasis of the right iliac system. In cases of this type intervention would be more effective if performed directly on the vena cava.

*Combat of Anthrax by Solutions of Formaldehyde in Industries Processing Hair and Bristles. E. Hailer and K. Heicken.—p. 109.

Intestinal Protozoa and Their Transmission in North Africa.—Westphal says that during the campaign in North Africa the index of infestation with Endamoeba histolytica and other intestinal protozoa was determined in May 1942 by means of stained stool preparations. It was found that those men who had been in North Africa during the summer and fall of 1941 showed a much greater rate of infestation than those who had reached North Africa only in November or later. However, repeated examinations in August and September of 1942 showed that the infestation rates had been equalized. Since the increase in infestation coincided with the season when flies were present in large numbers, the fly must be regarded as the chief transmitter of the intestinal protozoa. This was proved by the fact that in Tobruk 30 per cent of the flies caught near latrines were found to contain in the intestine cysts and protozoa harbored by the human intestine. Prophylactic administration of chiniofon or rivanol® (2-ethoxy-6,9-diaminoacridine lactate) caused intestinal disturbances and did not prevent increase in the rate of infection.

Epidemiology and Pathogenesis of Amebic Dysentery.—Westphal found that of 1,069 men examined during an average stay of 10.4 months in North Africa 64 per cent had had one or several attacks of intestinal disturbances that lasted three or more days. There was no relationship between the index of infestation with Endamoeba histolytica and the incidence of these intestinal upsets. Carriers of E. histolytica did not have more intestinal disturbances than had those who were free from such infestation. That infestation with E. histolytica had no causal significance for the intestinal disturbances was corroborated experimentally by successful infestation with filtrate of feces of a patient with intestinal disturbances who was free from amebic infestation. This indicates that the primary cause of the many intestinal disturbances was bacterial. In 4,057 patients with a clinical diagnosis of dysentery, 96.3 per cent was primarily bacillary on the basis of the clinical aspects and the microscopic examination of the feces and 3.7 per cent was only amebic dysentery at the time of examination. Of the 96.3 per cent in whom the primary cause was bacillary, only 7.6 harbored E. histolytica in their intestinal tract and 1.4 per cent showed symptoms of amebic dysentery in addition to those of bacillary dysentery. The author believes that these and other observations indicate that if E. histolytica is present in the intestinal lumen, amebic dysentery follows after a primary impairment by a bacillary infection. The development of amebic dysentery after bacillary dysentery was observed in several instances in the military hospitals.

Combating Occupational Anthrax.—Hailer and Heicken say that since some patients apparently contracted anthrax indirectly from materials that had become contaminated with anthrax organisms during transport, having been shipped in the same conveyances in which previously anthrax-infected materials had been shipped, it was decided to disinfect railroad cars and other transport facilities in which imported skins and other possible sources of anthrax had been transported. Storage facilities, tanneries, wool carding establishments, horsehair spinning shops and protective clothing of workers in these shops also were to be disinfected. Three potent chloride of lime preparations and formaldehyde in aqueous and soapy solutions seemed suitable for investigation. Since treatment with disinfectants would have to be carried out frequently in the open air and during all seasons of the year, their efficacy under various temperatures had to be investigated. Comparing the sporocidal action of the three chloride preparations, which are of the same potency as regards their active chloride content, it was found that caporit® (a calcium hypochlorite preparation) was the most efficient, the action of the other two preparations being considerably less, particularly at the lower temperature of 12 and 4 C. The disinfecting potency of formaldehyde solutions was considerably less than at 12 C. and even less at 4 C. than it was at 20 C. Soapy solutions of formaldehyde were more effective at the lower temperatures than were the aqueous solutions. Furthermore, solutions that had been prepared twenty-four hours before, whether with or without soap, were more effective than fresh solutions. Pieces of pine boards that had been contaminated with anthrax spores were treated with various disinfecting solutions. The favorable results obtained with solutions of caporit® and formaldehyde indicate that they are of practical value.

Combating of Occupational Anthrax by Formaldehyde Solutions.—Hailer and Heicken describe studies with watery and soapy formaldehyde solutions varying in temperature between 30 and 80 C. They were to be used for the disinfection of hair and bristles, which become damaged when disinfected by boiling or exposure to steam under pressure. It was found that the bactericidal effect of the formaldehyde solutions is greatly enhanced by increased temperature. With the same concentration, a formaldehyde solution is one hundred times as effective at 80 C. as at 20 C. Furthermore, the addition of soap increases the sporocidal effect. When anthrax spores were exposed to formaldehyde solutions for four to six hours the concentration could be reduced about one half for each 10 C. of increase in temperature. Thus at 30 C. the best concentration was 0.25 per cent, at 40 C. 0.15 per cent, at 50 C. 0.075 per cent and at 80 C. less than 0.02 per cent. On the basis of these observations a procedure was developed for the disinfection of animal hairs and bristles which was used with success in establishments that spin horse hair or manufacture brushes.

Book Notices

Technic of Medication. By Austin Smith, M.D., C.M., M.Sc., Director of the Division of Therapy and Research; Secretary, The Council on Pharmacy and Chemistry, The American Medical Association, Chicago. Fabrikold. Price, $4. Pp. 255, with 6 illustrations. J. B. Lippincott Co., 227-231 S. 6th St., Philadelphia 5, 1948.

This book does just what its title implies. It describes in detail the methods by which medication can be given, including special indications and means of preventing untoward effects. The author has wisely refrained from making the book cumbersome by a discussion of the treatment of individual diseases. Thus there is a considerable amount of useful information not ordinarily found in textbooks of medicine or therapeutics. A short introduction in which the trends in therapeutics and the relationship of drug therapy to other forms of treatment are discussed is followed by a chapter on the prescription. Since prescriptions are now written in English, contain as a rule only one active ingredient, and the dosage is given in the metric system, it is no longer necessary to devote considerable space to Latin endings, incompatibilities or methods of calculating doses. Instead, Dr. Smith has provided a concise discussion of the choice of drugs, the legal implications and the professional relationship of the doctor who prescribes to the pharmacist who fills the prescription and to the nurse who gives the medication to the patient.

Not only are the various methods of giving drugs discussed in detail, but figures, where indicated, help to make every procedure crystal clear.

The many different dosage forms with their special indications are given in a chapter on oral administration. In the section on parenteral administration, not only are the different types of injections carefully explained, but such details as care of needles and methods of loosening the plunger of the syringe when it is stuck in the barrel are given.

Chapters are devoted to the special problems of rectal and genitourinary administration, application to the skin, the eye, nose and throat and ear.

A final section entitled "Practical Aids" gives useful information on care of equipment, removal of stains, storage of medicinals, etc.

This is just the book that the young physician needs to enable him to form good habits in his method of treatment. It is also a useful reference book for the well established physician.

Disorders of Sex and Reproduction: Ætiology, Diagnosis and Treatment. By A. P. Pillay, O.B.E., M.B.B.S. Fabrikoid. Price, 18s. Pp. 299, with 7 illustrations. H. K. Lewis & Co., Ltd., 136 Gower St., London, W.C. 1, 1948.

In an analysis of 159 cases of male sex disorders, excluding sterility, the author states in his introduction that he found 132 cases caused by psychic factors. The book itself is concerned with all aspects of sexuality from anatomy and physiology to endocrinology, psychology and clinical syndromes. All sorts of disorders and syndromes are discussed with the treatment which the practical author states he has found successful among his own patients. The book is written simply and modestly and includes a wealth of clinical material. The psychologic data are somewhat naive and superficial but suited for the general practitioner, for whom the book is intended and for whom it will be rather useful.

Clinical Urology: Essentials of Diagnosis and Treatment. By Lowrain E. McCrea, M.D., F.A.C.S., F.I.C.S., Clinical Professor of Urology, Temple University Medical School, Philadelphia. Second edition. Fabrikold. Price, $6.50. Pp. 503, with 263 illustrations. F. A. Davis Co., 1914-16 Cherry St., Philadelphia 3, 1948.

The second edition does not vary greatly from the previous edition, except that all the advances which have gained acceptance in urology have been included. New photographs have been added and many illustrations redrawn. The index has been greatly enlarged, which has added to the usefulness of the book. The chapters are well arranged and organized. The type is ideal for easy reading. Because of its conciseness and practicability, the book can be highly recommended to the general practitioner as well as to the medical student.

The Open Self. By Charles Morris. Paper. Pp. 179. Prentice-Hall. Inc., 70 Fifth Ave., New York 11, 1948.

When a distinguished philosopher and serious scholar chooses to write for the lay public on the subject of man and his knowledge of man, which is essentially psychology, we expect a great feast. Without question the author can write simply, pleasingly and understandably, but his content is disappointing. From the first chapter, entitled "Man as His Own Maker," in which the modern world crisis is again outlined and responsibility placed on us (men), to the last page, where a credo of determination includes "we will resume the responsibility for man-making," there is an exhortion for us to rise up and do better. Thus the scholar becomes just another writer for the masses, who love to read how they should decide to be better and do better, and who search for the "how" of so doing. That is why these books year in and year out sell so well, no matter what their contents, for they promise much if the reader would only do better.

The author does, however, manage to convey in readable style much of the present day concepts of psychology intermixed with his predilection for purpose. But the book is pervaded with the notion of the importance of body types in normal and disordered functioning of body and mind. Morris has swallowed the ectomorph, endomorph and mesomorph trinity hook, line and sinker from Sheldon, apparently not even aware of the far older kretchmerian hypothesis which was discarded by medicine and psychiatry as being unfruitful for psychosomatic correlations. As a result the basic concepts which could be of value to the curious reader are distorted for him. He withdraws from exhortation to do better when he is continuously told that he does what he does because of his body structure, fully apparent at birth.

Introduction to Chemistry. By Bertha S. Dodge, A.B., M.S. Fabrikold. Price, $3.50. Pp. 312, with 40 illustrations. C. V. Mosby Co., 3207 Washington Blvd., St. Louis 3, 1948.

A textbook for student nurses, this highly compressed introduction to inorganic, physical, organic, biologic and pharmaceutical chemistry severely limits itself to topics of most immediate interest to its users: units of measurement; nature of matter and fundamental chemical theory; air, its composition and behavior in the atmosphere and in the body; water, its conversion to a potable liquid and uses as a solvent and chemical properties, including its action as a hydrating and ionizing agent; simple organic compounds; foods, their composition and fate in the body, and vitamins, sulfonamide compounds and antibiotics. The author is to be commended for her careful definitions, which are both scattered through the text and collected, for reference, at the ends of chapters; liberal use of examples and illustrations; clear and thought-provoking questions, and the employment of as simple a vocabulary as is compatible with the subject. However, it seems to the reviewer that the book would have to be supplemented to a much greater extent than a normally discursive text with skilful lectures and numerous laboratory demonstrations.

Language and Language Disturbances: Aphasic Symptom Complexes and Their Significance for Medicine and Theory of Language. By Kurt Goldstein, M.D. Fabrikold. Price, $8.75. Pp. 374, with 11 illustrations. Grune & Stratton, 381 Fourth Ave., New York 16, 1948.

This book of 374 pages on language is written by a competent neurologist and neuropathologist and is the result of many years of study both in Germany and in America. The author early in his discussion speaks of the difficulties that arise in the real understanding of speech and language. From the ordinary neurologic textbook one gets the idea that the difficulties of speech (aphasia, dysarthria, etc.) are easy to understand as far as localization and mechanisms are concerned. Goldstein shows that such an idea is not true. He attempts to present those speech disturbances observed in lesions of the brain cortex in a form useful both for theoretic and practical purposes in the clinic. There are two parts: One is on the origin of aphasic symptoms and the other is on speech problems, from the clinical and pathologic standpoint. This work is of tremendous clinical value, and as far as the review goes it is one of the best. Few medical men have attempted to discuss speech and aphasic disturbances. Every neurologist and psychiatrist should have this book now. The neurosurgeons will welcome it. It is written clearly and shows for the first time the relationship between direct lesions of the involved cortex of the brain with other parts of the brain as a whole.

The Drugs You Use. By Austin Smith, M.D., Director, Division of Therapy and Research, and Secretary, Council on Pharmacy and Chemistry, American Medical Association, Chicago. Foreword by Morris Fishbein, M.D. Cloth. Price, $3. Pp. 243. Revere Publishing Co., 15 Trinity Place, New York 6, 1948.

This book offers an authoritative explanation of the many stupid or vicious practices of "the exploiters of human faith in curative remedies." Its flowing style and nontechnical descriptions make it an ideal book for the intelligent layman who may be overwhelmed by the misleading statements and half-truths present in advertisements, the popular press and the radio. It also supplies many needed facts and figures for the busy doctor who must confute exaggerated claims brought to him by his patients. There are chapters on the past, present and future status of medicine as well as on "tonics," vitamins, hormones, vasoconstrictors, local antiseptics, barbiturates, laxatives, thyroid, antiasthmatics, cosmetics, cancer cures and chemotherapy; the dangers of self diagnosis and treatment, the hazards of the common "medicine chest" with its poorly labeled bottles and old prescriptions, the fallacies in scare headlines and rumors of new discoveries and a glossary of the more common scientific terms used in labels, advertisements and the lay press. This book also offers constructive advice for the best use of the usual home medications and in case of emergencies.

Some British Pioneers of Social Medicine. By Major Greenwood, D.Sc., F.R.C.P., F.R.S. University of London. Heath Clark Lectures, 1946, Delivered at the London School of Hygiene and Tropical Medicine. Cloth. Price, $4. Pp. 118. Oxford University Press, 114 Fifth Ave., New York 11; Amen House, Warwick Sq., London, E. C. 4, 1948.

A study of British pioneers and pioneering in social medicine in England in the late eighteenth, nineteenth and early twentieth century. The material presented relates to applications of medical and scientific knowledge in prevention and relief of suffering and as a means of elevation of the standards of living through social cooperation. Names of many pioneers in early social medicine are given and work credited to them. The body of factual material, however, relates to the personalities and works of Edwin Chadwick, William Farr, John Simon, Florence Nightingale and Frances Galton. The book is historical in nature and is developed from a series of lectures given by the author. Although much of the material presented is of interest to the profession generally, it is of greater value to those interested in the development of medical statistics and historians of medical-social movements.

Frontier Doctor: The Autobiography of a Pioneer on the Frontier of Public Health. By Samuel J. Crumbine, M.D. Cloth. Price, $3. Pp. 281. Dorrance & Co., Inc., 364 Drexel Bldg., 5th and Chestnut Sts., Philadelphia 6, 1948.

Dr. Crumbine presents a variety of personal experiences, incident to the practice of medicine in Dodge City, Kan., in the 1880's and 1890's. Emphasis is also given to experiences in pioneering in public health movements in Kansas during the late 1890's and the early years of the twentieth century. An account of the author's difficulties in initiating and maintaining venereal disease control during the first world war is particularly interesting. Pioneering efforts in obtaining sanitary facilities for the transportation of seafoods from the coast areas to the Midwest are described. Interesting personal opinions on matters relating to the general practice of medicine such as evolution, hypnosis, telepathy and juvenile delinquency are included. Dr. Crumbine's narrative is informative light reading for physicians or for the laity as a record of early accomplishments in public hygiene in Kansas.

Directory of the American College of Hospital Administrators, 1948. Paper. Price, $10. Pp. 331. American College of Hospital Administrators, 22 E. Division St., Chicago 10, 1948.

The 1948 Directory is the fourth in a series of biographic catalogs issued by the American College of Hospital Administrators. It contains alphabetical lists of 325 fellows, 702 members and 330 nominees representing a total college affiliation of 1,357. The biographic information in relation to each administrator includes present position, educational qualifications, previous positions held, memberships in professional organizations and present residence. For convenience of reference there is not only a general index but also a separate alphabetical listing arranged on a regional basis. Lists of officers and regents and members of permanent committees are likewise included. For general information there is a historical sketch of the organization program and a full description of the constitution and by-laws under which the college operates. This volume is a valuable reference and source of information for all who are concerned in the administration and management of hospital services, as well as those who are seeking persons with hospital administrative experience.

Premature Infants: A Manual for Physicians. By Ethel C. Dunham, M.D. U. S. Federal Security Agency, Social Security Administration, Children's Bureau Publication No. 325. Paper. Price, $1.25. Pp. 401, with 31 illustrations. Supt. of Doc., Government Printing Office, Washington 25, D. C., 1948.

This comprehensive monograph with its complete bibliography is written as a source of information and as a guide for the general care of the premature infant.

The content is divided into two parts: Part I covers general considerations including objective measures for prematurity, incidence of premature birth, causes and prevention, deaths of premature infants in the United States and physical growth and prognosis. Part II includes clinical considerations, clinical appraisal, care in the neonatal period, nutrition, congenital malformations, birth injuries, infection, abnormal blood conditions, metabolic disturbances, nutritional disturbances (rickets and tetany) and other conditions (retrolental fibroplasia, noninfectious skin conditions and diarrhea), and miscellaneous material is discussed in the appendixes.

This book could well be added to the library of all physicians and, because of its complete bibliography, should be of special interest to those desiring to keep posted on the subject as a whole.

The Hospital Building: Comprising the 1947 A.I.A. Convention Seminar Addresses on Hospitals, and the Building Type Reference Guide No. 2. Reprinted from the Bulletin of The American Institute of Architects, May 1947 and January 1948. Compiled and edited by Walter A. Taylor, Director, Department of Education and Research, The American Institute of Architects, Washington, D.C. Paper. Price, $2. Pp. 71, with 7 illustrations. Department of Education and Research, The American Institute of Architects, the Octagon, Washington 6, D. C., 1947-1948.

In its 1947 seminar on hospitals the American Institute of Architects discussed such subjects as the past and future developments of hispitals in the United States, administrative aspects of hospital design, development of hospital plans and details of hospital construction, finishes and equipment. Because of continued interest the lectures on these subjects, together with other material and bibliographic references, have been made available in printed form. The present volume, therefore, is a convenient, compact source of reference useful not only to the architectural profession but also to other organizations and individuals interested in hospital planning and construction.

Exploración clínica del aparato o sistema digestivo. Por el Dr. R. Vicuña Herboso, profesor titular de medicina de la Universidad de Chile. Con la colaboración del Dr. Emilio Sáez S., ayudante de la cátedra. Fabrikoid. Pp. 631, with 290 illustrations. Publicado por la Universidad de Chile, Santiago de Chile, 1948.

This is an attractive, well printed and well illustrated volume, which contains much information. It is a textbook on gastroenterology. The book was written by a professor of medicine in the University of Chile. There is much in it that will be of value to the Spanish-speaking student.

Unfortunately, the several sections are of unequal value, some of them being too short to be adequate. For instance, on page 165, only a third of a page is given to flatulence, which is one of the commonest of the symptoms complained of by dyspeptics. On page 164, only a third of a page is given to regurgitation. In this article the author fails to show that he has any knowledge of the symptom. One half of page 163 is on heartburn. There again the author shows no knowledge of his subject. He confuses heartburn with a burning in the epigastrium, which is an entirely different disease.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

THE STATUS OF OSTEOPATHY AS A SPECIFIC METHOD FOR LOW BACK PAIN

To the Editor:—An old patient came in and said his low back pain was almost cured by two osteopathic treatments; I had treated him for six weeks with all kinds of treatments. Can these osteopaths and chiropractors do more for most patients with the usual low back pain than can the physician? What does the osteopath have and do for these backs? Can you help me? J. J. Blinn, M.D., Long Beach, N. Y.

[The question was referred to four physicians with extensive experience in the study of low back pain. Their replies follow.—Ed.]

ANSWER.—The fact that a physical procedure gives relief of a physical complaint does not necessarily mean that only physical factors are involved in producing the result. There seems to be good reason to believe that states of tension produce discomfort in the back. Tension aches and pains are commonly noted about the eyes and the back of the neck. Many of the physical procedures that relieve such tension pain would seem to include a strong element of suggestion. Sometimes physical procedures may relieve chronic anxiety, which in turn reduces tension and the pain associated with it. Not uncommonly, patients with states of depression who also have low back pain report complete disappearance of discomfort in the back after being subjected to electric shock therapy. Some patients who had been placed in plaster body casts without relief for the back pain have had complete relief after treatment for their psychiatric disorder by shock methods. It seems remarkable that this is the case even though shock treatment may in other instances produce compression fractures of the vertebrae and back pain. The fact that a physical treatment is striking or unusual, or is looked on disapprovingly by medical authorities, may reinforce its psychologic effects.

ANSWER.—Many of my patients with lame backs have been in the hands of osteopaths, some of them for twenty-five years, without cure.

The only thing that the osteopath does is to give manipulations of the spine which suddenly relieve muscle spasm. This does not cure the underlying cause of the lame back. Sometimes injections of procaine hydrochloride or histamine into the muscles will have a dramatic effect on muscle spasm.

I have seen patients with carcinoma of the spine who have been treated by an osteopath with disastrous effects. No worse treatment could be prescribed for this condition.

ANSWER.—Many intangibles enter into the practice of medicine. Manipulations of the back for low backache and for sciatica do occasionally help but it is not true that "the batting average" of the chiropractor and osteopath is any higher than that of the orthopedic surgeon. The orthopedic surgeon may be too conservative about manipulations, particularly in the United States. In England manipulative measures are more commonly employed by surgeons.

Those who have been in orthopedic practice for many years know that manipulations for low backache and sciatica occasionally do help. However, the doctrines taught by osteopaths and chiropractors are unsound.

Many years ago the Amercian Orthopaedic Association had one of its highly respected members at a meeting of the Society in the City of Boston, present either an osteopath or a chiropractor, I cannot remember which, to demonstrate to the members the why and how of his manipulative procedures. The members were not impressed, largely because the anatomic and physiologic knowledge of the manipulator and the interpretation of what was to be attempted were so apparently superficial.

Orthopedic surgeons have all seen suffering and sometimes actual damage done by manipulations by the irregular practitioners.

The comparatively recent outstanding surgical scientific finding that a ruptured and protruded intervertebral disk is a leading cause of low backache and sciatica has perhaps unduly thrown into the background the value of manipulative procedures. Not all backache and sciatica are due to protruded intervertebral disk. I suggest that you consult several books, including one by Mennell (Mennell, J. B.: Physical Treatment by Movement, Manipulation and Massage, ed. 5, Philadelphia, The Blakiston Company, 1945), one by Fisher (Fisher, A. G. T.: Treatment by Manipulation, a Practical Handbook for the Practitioner and Student, ed. 2, London, H. K. Lewis & Co., 1928) and one by Krusen (Krusen, F. H.: Physical Medicine; the Employment of Physical Agents for Diagnosis and Therapy, Philadelphia, W. B. Saunders Company, 1941).

ANSWER.—Careless manipulation can result in death or lasting harm to the patient. An accurate diagnosis is the first requirement before considering manipulation; here the osteopaths and chiropractors frequently get into trouble. Tuberculosis, cancer, fracture, marked osteoporosis or an acute infectious process must be ruled out. This requires adequate roentgenograms and a careful physical examination. Manipulation is often of great value when used together with other orthodox methods of treatment, such as active exercises, physical therapy, traction or immobilization by cast or brace.

The most dramatic results are obtained in those patients who suddenly get a "catch" low in the back, with acute muscle spasm and inability to straighten up. The osteopath calls this a dislocation of the spine. Possibly an incomplete subluxation of the facets may occasionally occur, with the subsequent acute muscle spasm preventing return to normal position. Frequently in this type of patient relief is obtained from a general anesthetic with a minimum of manipulation. The patient with chronic fibrositis may also receive relief in conjunction with proper follow-up care. Many patients do not require general anesthetics for a satisfactory manipulation, though a patient with chronic disability who is apprehensive will do so.

The purpose of the manipulation is to restore length and tone to contracted muscles and ligaments and possibly to break up adhesions in and around the facets. Patients with herniated disk syndromes have frequently been temporarily or permanently relieved by proper manipulation.

Review the roentgenograms before examining a patient. Use a series of manipulations as part of the examination. The manipulation is carried out on a low, firm examining table. The flexed knee is first forced up toward the chest, each knee separately and then together. Then with one thigh hanging off the side of the table locking that side of the pelvis, forcibly flex the opposite hip with the flexed knee, producing torsion on the sacroiliac joints. Patrick's test is forcibly carried out bilaterally. Straight leg raising is carried out with only moderate force. With the patient in the prone position the back is gently hyperextended at several levels by elevation of the thighs with the other hand placed on the patient's back. Lateral manipulation is also possible in this position. With the patient on his side, the upper hip and the knee are flexed, and with one hand on the patient's ilium and the other hand on his shoulder, rotation strains are thrown on the sacroiliac joints and lower part of the spine by force in opposite directions with the hands. A final maneuver is a kick and stretch manipulation of each lower extremity. This is possible only when the patient is awake. The patient flexes the hip and knee with the surgeon grasping the ankle. The patient strongly kicks the leg as the surgeon gives a quick jerk on the ankle. This last manipulation is of particular value when partial subluxation of a joint or a disk syndrome is suspected.

For an excellent discussion of manipulation of the back it is advised that "Backache and Sciatic Neuritis" by Philip Lewin and published by Lea and Febiger be consulted.

FLUORIDES

To the Editor:—Is it safe to dispense a fluoride preparation (4 grains of sodium fluoride to 128 ounces [3.8 liters] of isotonic sodium chloride solution) for daily teeth cleansing for children? Is such a solution poisonous if taken internally? This preparation is being prescribed by some dentists. Louis M. Harley, M.D., Detroit.

ANSWER.—Topical application of fluorides for the prevention of dental caries still has many unknown factors. Available evidence suggests multiple applications of a 2 per cent aqueous solution of sodium fluoride preceded by oral prophylaxis (*J. Am. Dent. A.*, **34**:700 [May 15] 1947).

Sodium fluoride is a deadly poison, and toxic symptoms have been induced by doses as small as 60 mg. The average fatal dose for mammals is considered to be about 0.5 Gm. per kilogram orally. Possibility of accidental poisoning is always present when such potentially toxic substances are present in the home. Additionally, their presence predisposes to abuse through overuse. Administration of fluorides in any form should be under the direct supervision of a dentist.

DIAGNOSIS OF SYPHILIS

To the Editor:—A married woman, aged 34, had a positive Wassermann reaction on Oct. 6, 1947. One year prior to this she had a negative blood reaction during examination for a food handler's permit. No known primary or secondary manifestations occurred. The Army "twenty-six week" rapid treatment with oxophenarsine hydrochloride and bismuth subsalycilate was given. During the course of treatment a blood test in January 1948 elicited a negative reaction. In May 1948, at the completion of the twenty-six week treatment, the blood reaction was also negative. A positive report was returned on Sept. 20, 1948, during follow-up. After this 600,000 units of procaine penicillin in sesame oil was given daily for ten days. Two weeks later the blood reaction was again positive. Has this patient had adequate treatment? May a second infection be present? What further treatment is needed?

M.D., North Carolina.

Answer.—This inquiry raises a whole list of problems in the diagnosis and treatment of syphilis which cannot be covered in a brief answer. Important information is omitted from the inquiry. Does the patient have any physical evidence of syphilis, congenital or acquired? Does her husband have syphilis? Has she any children, and if so, is there any evidence of syphilis in any of them? Was the original positive "Wassermann" rechecked in order to rule out technical error before treatment was instituted? Was the original test quantitatively titered? Since the patient had been known to be seronegative one year before the appearance of the first positive serologic test for syphilis, had she, during the year preceding the discovery of this test, been subjected to any of the extraneous influences known to produce biologic false positive serologic reactions? Has her spinal fluid been examined and, if so, with what result? Were the serologic tests performed after the twenty-six week Army treatment done on a quantitative or a qualitative basis; and what is the quantitative titer now, before, and after the injections of procaine penicillin?

On the basis of the information presented, it is far from certain that the patient has syphilis, either a first or a second infection. In these circumstances it is impossible to offer any opinion as to whether she requires further treatment.

TECHNIC OF FLUORINE APPLICATION

To the Editor:—What is the exact technic of painting a child's teeth with sodium fluoride solution to prevent decay?

Frank W. Dimmitt, M.D., Providence, R. I.

Answer.—The coronal surfaces of the teeth are cleaned in the customary manner, i. e., with a motor-driven rubber cup and fine pumice. Only the first topical application in the series of four weekly applications is preceded by dental prophylaxis.

The cleaned teeth are then blocked off with cotton rolls, generally an upper and lower quadrant being treated at one time. The cotton rolls in the lower part of the mouth are held in position by cotton roll holders. In both the upper and lower arch care should be taken to see that the cotton rolls are clear of the teeth so as to avoid absorption by the cotton rolls of the applied solution.

After isolation with cotton rolls, the teeth are dried with compressed air, particular attention being given to drying the interproximal tooth surfaces. A 2 per cent solution of sodium fluoride (chemically pure sodium fluoride in distilled water) is then applied to the dried enamel surfaces of the teeth by means of either a cotton applicator or a light spray. All surfaces, including the interproximal areas, should be wetted and the applied solution allowed to dry in air for three minutes. The second, third and fourth applications are made at weekly intervals. It has been suggested that the series of four applications be given at 3, 7, 10 and 13 years of age so as to protect the deciduous teeth and the various permanent teeth which erupt between the sixth and twelfth years of life.

IVY POISON TRANSMISSION

To the Editor:—As the years have passed, each generation has had its own ideas regarding poison ivy. One group insists that close proximity to the plant is sufficient to cause a serious involvement of the skin. Other groups believe that actual contact is necessary before skin lesions will occur. What are the pertinent facts in this matter?

M.D., Indiana.

Answer.—Poison ivy dermatitis results when the irritating substance from the plant comes in contact with a susceptible skin. The contact, however, does not of necessity have to be a direct or obvious one. Shelmire has often noted ivy dermatitis which has resulted from contact with contaminated intermediary objects such as luggage, hunting or fishing equipment, shoes and golf clubs and even from the fur of dogs that had run through an ivy patch. Andrews stated that "some persons are so susceptible that direct contact is not necessary, the poison being apparently carried a short distance by the wind."

DERMATITIS FROM SHIRT FINISH

To the Editor:—A white man aged 40 suddenly had urticarial eruptions on the trunk which gradually spread to the face. This occurred every time that the patient wore a brand new white dress shirt. After the shirt had been washed five to ten times at the laundry he would be able to wear it without any eruption. Is there any substance in brand new white shirts that can be responsible for such a skin eruption?

M.D., New York.

Answer.—Most new fabrics from which wearing apparel is made have a finish on them to give the fabric certain desired properties such as better appearance, better wearing qualities and prevention of runs. In your patient's white shirt, the finish was probably one that gave the fabric a better appearance. Such finishes usually contain a synthetic resin, and sensitivity to synthetic resins is not uncommon. An outbreak of dermatitis from wearing apparel, reported in 1940, was found to be due to a synthetic resin finish. Such finishes require many launderings for complete removal. The colored shirts worn by your patient may have had another type of finish. The dress shirt material may require a stiffening finish which is not required by the colored shirts. Directions for determining the exact cause of dermatitis from wearing apparel are to be found in "Occupational Diseases of the Skin," by Schwartz and Tulipan, page 304. (Schwartz, L.; Tulipan, L., and Peck, S. M.: Occupational Diseases of the Skin, ed. 2, Philadelphia, Lea & Febiger, 1947, p. 304.)

ACTIVITY OF VIRUS IN SERUM HEPATITIS

To the Editor:—During service I incurred a mild form of homologous serum jaundice following administration of yellow fever vaccine. Jaundice was not sufficient to require hospitalization. Since then I have not had symptoms referable to the jaundice. Is the virus still active at this time? What laboratory tests can be used in this investigation?

M.D., Louisiana.

Answer.—Clinical or practical laboratory tests for the detection of the virus of homologus serum jaundice are not known. Various hepatic function tests have been used serially in some groups of patients who have had an abnormal convalescence from infectious hepatitis or serum hepatitis (homologus serum jaundice). Such tests include: the determination of sulfobromophthalein sodium retention, the plasma bilirubin level and the thymol turbidity reaction of the serum. Unless such tests reveal persistent and appreciable abnormalities it would be difficult to interpret them in an asymptomatic patient.

REFLEX SNEEZING FROM LIGHT

To the Editor:—Can looking at bright lights cause sneezing in some persons? What is the mechanism of action and methods of treatment? Are such persons prone to have asthma, or other allergic manifestations?

T. E. Finegan, M.D., Elyria, Ohio.

Answer.—Sneezing on looking at bright light is probably produced by a reflex through the autonomic nervous system, much like coughing elicited by irritating the external auditory canal. This is to some extent a normal phenomenon. Those with nasal irritation or an acute infectious rhinitis are more likely to be affected by light stimulation or by other nonspecific stimuli such as dust and chemical fumes. If a person is affected by light in the manner described there is a fair possibility that he already has a nasal allergy. Anyone who has allergic rhinitis is likely to have asthma later.

DFP IN GLAUCOMA

To the Editor:—In The Journal, Oct. 23, 1948, page 625, response to a question regarding the efficacy of DFP in glaucoma contained this statement, "In general, when other miotics, as pilocarpine or physostigmine, fail to control the tension, DFP has little chance of success."

I should like to summarize for you data that have been obtained by various ophthalmologists in this country who have attempted to evaluate the usefulness of DFP in glaucoma. First of all, to the best of my knowledge, DFP is effective in lowering the intraocular tension in practically all cases in which other miotics are effective. In addition to that, it has been shown repeatedly that intraocular tension may be lowered by DFP when all other miotics or combinations of miotics have failed. In McDonald's series, 57.4 per cent of glaucomatic eyes resistant to other miotics were controlled by DFP; Dunphy reported 35 per cent; von Sallmann 63.1 per cent; Marr 15.6 per cent, and Leopold and McDonald 25 per cent response in eyes resistant to other miotic therapy. The statement, therefore, that DFP has little chance of success when other miotics fail to control the tension seems to me to be unwarranted, and correction should be made in the columns of your journal. I know of only one large ophthalmology clinic in this country that shares the opinion expressed in your answer. A valuable drug should not be dismissed on the basis of this one opinion.

SURGICAL TREATMENT OF ENDOMETRIOSIS

With Special Reference to Conservative Surgery in Young Women

CLAYTON T. BEECHAM, M.D.
Philadelphia

In the past twenty-five years abundant information regarding the behavior of endometriosis has been acquired. Enlightenment is so far from complete that the variegated pattern of this disease leads to a "wide open" field in fundamental research.

This common gynecologic lesion has undeniably been dealt with satisfactorily in many instances, long before the entity endometriosis was known to exist. The empiric treatment of dysmenorrhea has in the past and is now relieving many patients suffering from endometriosis. Nature (since the beginning of time) has employed an efficient prophylactic and curative measure for endometriosis, i. e., pregnancy. It is noteworthy that the frequency with which the diagnosis of endometriosis is made parallels the increased use of contraception, the emancipation or rise of womankind to careers and/or late marriage with late childbearing.

As observations on the behavior of endometriosis increase, the indications for surgical treatment decline. Medical and hormonal therapy have played an increasingly important role in the management of cases. Pregnancy, the best therapeutic measure, comes under the heading of hormonal therapy, with respect to endometriosis. There are limitations as well as failures in nonoperative treatment of heteroplastic lesions. Indeed, there are endometrial lesions of such magnitude that surgical treatment is almost an immediate necessity when the lesions are discovered.

NECESSITY FOR SURGICAL INTERVENTION

Endometriosis is a disease of young women, producing symptoms chiefly in the reproductive years. This troublesome fact is reason enough to make a conscientious physician hesitate before operating. I do not regard the diagnosis of endometriosis alone as an indication for surgical intervention.

The management of a woman with endometriosis requires the patience of Job. It requires constant observation, so that over a period of time one is apt to believe that one is seeing a large volume of cases. To determine accurately the incidence of endometriosis in my practice, 1,000 unselected consecutive cases were taken from the files for analysis.

The diagnosis of endometriosis was made fifty-eight times (table 1), for an incidence of 5.8 per cent. Table 2 summarizes the management. One half of the patients were successfully cared for without recourse to operation. Forty-one per cent were operated on for uncontrolled symptoms of endometriosis, while 8.6 per cent presented the incidental observation of endometriosis with other far more important pathologic conditions.

I have found the following conditions to be indications for surgical treatment after failures of medical therapy (they are listed in order of frequency):

1. Dysmenorrhea. This symptom may be the accentuation of primary dysmenorrhea or an intensification of the acquired type.
2. Pain in the lower quadrant of the abdomen. This pain is most frequently in the left lower quadrant. Discomfort is usually crampy in nature, although I have observed it to be constant in some cases. Menstruation accentuates the pain.
3. Dyspareunia. It is easily understood how endometrial fixation of the uterine body in the cul-de-sac or involved uterosacral ligaments by the same process, not to mention adnexal endometriosis, will cause dyspareunia.
4. Menorrhagia. An abnormal loss of blood with periods is one of the less common symptoms. It should be remembered in discussion of endometriosis, as many other gynecologic lesions, that menorrhagia may be due to a coexisting pathologic condition. As an example, I have encountered advanced endometriosis with pelvic inflammatory disease and carcinoma of the corpus and cervix uteri as well as malignant conditions of the ovary.
5. Rectal pain and tenesmus. This is a selective complaint. If the rectovaginal septum and/or cul-de-sac is involved, this symptom is easily understood.
6. Metrorrhagia. Generally, causative factors other than endometriosis should be looked for when this complaint is noted. I have observed patients with endometriosis of the cervix, vagina and episiotomy scars to have this symptom following trauma.

It must be remembered that any combination of these symptoms may be present. Finally, I wish to emphasize that these women as a rule are not subjected to surgical treatment without a trial on medical therapy.

SURGICAL TREATMENT OF ENDOMETRIOSIS

Each case of endometriosis must be carefully individualized. The important factors that will aid a surgeon in the selection of a given procedure are: (1) age of patient, (2) marital status, (3) number of children, (4) infertility, (5) acceptance of a conservative policy as regards the operation and what it might mean in the event of a failure to relieve all the symptoms and (6) emotional balance of the patient.

With respect to the first point, the treatment of a young patient between the ages of 16 and 40 years, single or married and without children is briefly

Read in a panel discussion on endometriosis before the Section on Obstetrics and Gynecology at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 23, 1948.

presented. The extent of the endometriosis responsible for symptoms is exceedingly variable. She may have nothing more than one involved uterosacral ligament with an adherent retroverted uterus or a uterus in normal position with bilateral 8 to 10 cm. ovarian endometrial cysts along with a liberal cul-de-sac involvement. Regardless of the extent, conservative surgical treatment should be carried out if possible. Many of the implants may be safely removed, the ovaries bisected and resected, the uterus suspended if necessary and a presacral neurectomy carefully done. In addition, the tubes should be carefully inspected to confirm patency. Sulfanilamide crystals (5 Gm.) should be poured around the adnexa to lessen adhesions. It is obvious from this description that an attempt is made to preserve the childbearing function of the patient.

The patients with severe disease, particularly with ovarian endometriosis, have faulty ovulatory function before operation, and I have noted ovulation in from three to six months following operation. In 43 cases of advanced ovarian endometriosis in which I have carried out the aforementioned surgical procedures, there were 37 per cent conceptions. I have classed results in 4.5 per cent of the cases as failures. Although in 2 cases there was no pain, the ovarian heteroplastic spread was increasingly evident after the sixth postoperative month. Roentgen rays, in low dosage, were used to bring the lesion under control. The conservative steps described have been varied only with extensive sigmoid involvement. Minimal bowel implants were removed if possible. On the other hand, I have left superficial areas of endometriosis of the sigmoid measuring as much as 2 by 4 cm., removing only the complete uterus and leaving resected ovaries in situ. Hysterectomy, like pregnancy, interrupts menstrual function, and this alone seems to be beneficial.

Any patient, regardless of age, with symptoms of partial bowel obstruction from endometriosis is operated on as soon as it is possible to do so. At laparotomy, the sigmoid involvement may demonstrate an infiltrating lesion that leaves no doubt as to the cause of symptoms. In such rare instances, it is necessary to do a hysterectomy and bilateral removal of the adnexa. Only in the cases of advanced bowel lesions, or possibly in women over 45, do I feel that one should completely ablate the pelvis. On the other hand, with endometriosis in patients over 40 years of age, I have found that a panhysterectomy alone will control most lesions and relieve symptoms. It is not necessary to castrate women indiscriminately because of endometriosis.

Table 1.—*Occurrence of Endometriosis in a Gynecologic-Obstetric Private Practice (Consecutive, Unselected)*

Number of Cases Studied	Number of Cases with Diagnosis of Endometriosis	Percentage of Cases in Practice
1,000	58	5.8

In the surgical treatment of endometriosis when I have encountered cul-de-sac involvement to any degree in the past, I have been reluctant to do a complete hysterectomy. However, subtotal hysterectomy has little appeal because of the troublesome pathologic conditions which may arise in the retained cervix.

For the two years prior to reporting I have done complete hysterectomies with cul-de-sac and uterosacral endometriosis and have encountered no serious difficulties. Reasonable care must be exercised, but the operation is not formidable. Another error that has been perpetuated concerns drainage in cases of endometriosis. Drains have done more harm than good, by adding the hazard of secondary infection. There is no necessity for this procedure, and I strongly advise its abandonment.

Table 2.—*Management of Endometriosis*

Management	No. of Cases	Percentage of Cases
Nonoperative therapy	29	50.0
Surgical treatment for endometriosis	24	41.4
Surgical treatment for other disease (endometriosis also found)	5	8.6
Total	58	100.0

CONCLUSIONS

1. Medical and endocrine therapy is of great value in the management of endometriosis.
2. Judiciously spaced pregnancies produce a most helpful response in endometriosis.
3. There is no reason for wholesale castration in endometriosis.
4. Surgical procedures must be carefully individualized.
5. The conservative surgical approach has been found to be worth while and is eminently satisfactory for endometriosis.

MANAGEMENT OF COMPLICATIONS OF ENDOMETRIOSIS

CLYDE L. RANDALL, M.D.
Buffalo

Women experience varied discomforts due to endometriosis. It must first be decided which to consider complications of the disease. The site of an endometrioma does not of itself assure development of difficulties, and extragenital or extrapelvic foci may not cause eventual distress. Often there seems little correlation between the severity of symptoms and the extent of the disease. Certainly, for the purposes of this discussion, unexpected or undesirable effects of endocrine, radiation or surgical treatment should not be ascribed to endometriosis. I would consider as complications disturbances resulting whenever disseminated superficial lesions or a single penetrating nodule, symptomatically or mechanically, interferes with the function of the reproductive, urinary or digestive tracts.

Such complications give rise to nonspecific symptoms, all of which are commonly due to lesions other than endometriosis. The mere fact that a patient's complaints may be due to this disease tends to keep attention focused on this possibility.

DISTURBANCES OF MENSTRUATION

Among the possible complications of endometriosis, the reproductive system might be expected to be most frequently disturbed. Yet menstrual irregularities are not often due to this disease. Irregular intervals between periods or prolonged periods of flow are

---

Read in a panel discussion on endometriosis before the Section on Obstetrics and Gynecology at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 23, 1948.

usually due to systemic factors or pelvic pathologic conditions other than endometriosis. It seems evident that, while endometriosis may complicate the menstrual function, it does not do so in a specific or pathognomonic manner.

Menstrual pain has long been regarded as a sign of this disease. It has even been suggested that we are overlooking early cases of endometriosis among patients treated for primary or functional dysmenorrhea. However, like pelvic inflammation and neoplasm, endometriosis frequently gives rise to symptoms that may be aggravated at the time of a period, but tend to recur throughout the month. Many writers have emphasized that the points in the patient's history suggesting endometriosis must be elicited by the examiner's questioning. Yet, even with apparently "endometriosis-conscious" history taking, dysmenorrhea has been reported as a complaint by not more than 40 per cent of women found to have this disease.

In an attempt to evaluate menstrual pain as a sign of endometriosis, associates and I reviewed 2,000 consecutive menstrual histories given by women under 40 years of age, who up to the time of writing had shown no evidence of endometriosis. Eleven per cent were examined because of a primary complaint of dysmenorrhea, but, when questioned, an additional 33 per cent stated that they had experienced severe (18 per cent) or mild (15 per cent) cramping at the time of their periods. Frequent as menstrual pain may be, nevertheless, when the patient describes a classic and progressive "acquired" type of pain, a history of dysmenorrhea warrants a suspicion of endometriosis.

DISTURBANCES OF REPRODUCTION

Dyspareunia often complicates genital tract function, and this complaint, like persistent backache, should be regarded as so inevitable a result of endometriosis that relief should be expected only with eradication of the responsible implants.

Infertility appears to be a complication; at least it is frequently associated with endometriosis. Perhaps we have too readily concluded that the disease interferes with the reproductive function, but evidence suggests that the development of endometriosis is favored by infertility. Endometriosis does not regularly interfere with ovulation, and it does not close the genital tract and actually prohibit conception. Moreover, existing foci of endometriosis undergo noticeable resolution during a pregnancy.

DISTURBANCES OF DIGESTIVE TRACT

Digestive disturbances are rarely due to endometriosis. However, the rectosigmoid and occasionally the appendix or terminal ileum may become involved to a degree producing symptoms. Particularly in the rectosigmoid, endometriosis may produce symptoms and observations simulating diverticulitis or cancer of the bowel.

DISTURBANCES OF URINARY TRACT

Urinary distress is not often due to endometriosis, but bladder function and the caliber of the lower ureter may be effected by the disease. Vesicular symptoms are most frequently due to implants, giving rise to peritoneal adhesions and pain when the bladder is full, particularly discomfort as the full bladder is being emptied. This type of involvement usually accompanies ovarian endometriosis and is evident when the peritoneum is opened.

NONOPERATIVE TREATMENT

Roentgen Irradiation.—The effectiveness of roentgen irradiation as a means of controlling endometriosis has been evaluated by Jenkinson and Brown [1] and more recently by Schmitz and Towne.[2] In a limited experience, we have found subcastration dosage of little benefit, but there is no question as to the effectiveness of irradiation when the patient can be treated as to assure castration.

Endocrine Therapy.—At the present time it is difficult to evaluate endocrine therapy, which may yet provide a nonoperative means of affording relief from the discomforts of endometriosis. The use of androgens has been suggested by Hirst [3] and Miller.[4] Estrogen therapy seemed occasionally helpful to Schmitz and Towne,[2] but its effectiveness in larger dosage is being emphasized by Karnaky.[5] Since Bushnell [6] has recently recommended that patients with endometriosis be advised never to take estrogens, there is obvious need for further careful study of this whole matter. Our results with androgens have been altogether disappointing. Our experience with estrogen therapy has been too limited to justify an impression as to its possible effectiveness.

SURGICAL CONSIDERATIONS

Management of Dysmenorrhea.—Treatment of the patient when dysmenorrhea is due to endometriosis requires a decision as the type of lesion accounting for such pain. Does dysmenorrhea occur when only external endometriosis is present—when there is no adenomyosis? Does the occurrence of typical acquired menstrual pain always mean involvement within the uterine wall? At operation, when ovaries adherent and distorted by endometrial cysts seem to account for dysmenorrhea, can the possibility of uterine lesions be disregarded, particularly if the uterus does not grossly suggest adenomyosis? To date, among 298 patients with grossly evident chocolate cysts, we have found that 39.6 per cent complained only of dysmenorrhea, without intermenstrual or menstrual aggravated pain. However, among 438 cases in which a removed uterus revealed adenomyosis and there had been no appreciable external endometriosis at operation, a significantly lower incidence, i. e., 22.6 per cent of the patients had complained only of dysmenorrhea. All would agree that menstrual pain may be due to adenomyosis grossly not evident at operation. If the uterus and any ovarian tissue are to be preserved, a presacral nerve resection may prove necessary to relieve the patient's complaints. However, neither dysmenorrhea nor other pelvic pain associated with ovarian or parametrial external endometriosis will be relieved by presacral neurectomy. Thorough exploration and adequate resection of involved and suspected tissues are equally important if the patient is to be relieved.

Hysterectomy.—Cashman [7] has reported removal of the uterus with preservation of uninvolved ovarian tissue as an effective treatment for endometriosis. He

stated there were no reoperations among his patients treated by hysterectomy alone, i. e., without effort to remove evident foci of external endometriosis; hence there has been no opportunity to observe what happened to the endometrial implants that were not disturbed. We have had no experience with comparable cases and cannot comment on Cashman's interesting experience.

Castration or Resection.—The general surgeon's treatment of endometriosis has long been excision of the chocolate cysts that so often indicate the diagnosis. The castration thereby produced has, at least, avoided further progress of the disease. Obstetricians doing gynecologic surgery have emphasized resection of ovaries rather than oophorectomy. Pregnancies have been realized in at least one third of such conservatively treated patients. However, we must also admit that the same carefully preserved ovarian function allows persistence or recurrence of endometriosis to a degree requiring reoperation in at least 30 per cent of cases.

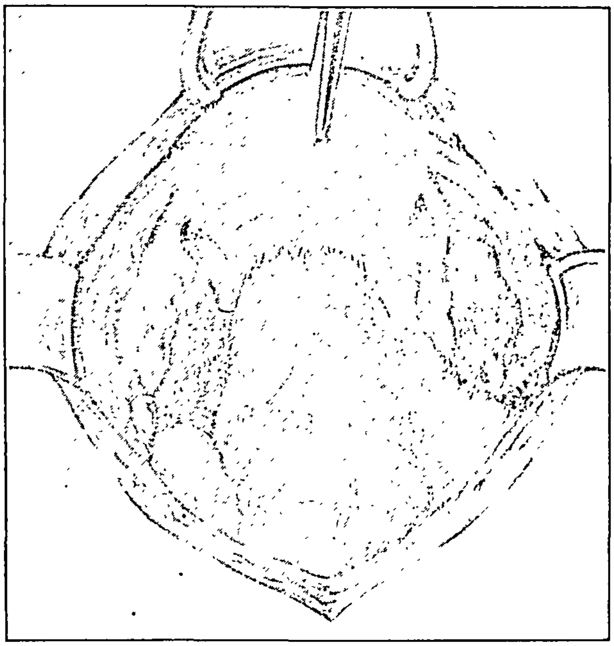

Fig. 1.—The adnexa can be freed from beneath the broad ligament, after which the underlying parietal peritoneum can be opened.

Conservative surgical treatment in younger women may be followed by later development of more extensive endometriosis in the cul-de-sac, with rectal symptoms from fixation of the rectosigmoid against the posterior uterus and vagina, persistent backache from thickened uterosacral ligaments and even ureteral narrowing from the parametrial thickening. A single endometrioma, or endometriosis retroperitoneal and involving the rectosigmoid, requires a choice between removal of the involved tissues by resection or control of the disease by castration. Either by roentgen irradiation or oophorectomy, castration accomplishes symptomatic relief easily. Resecting posterior vaginal wall, the rectovaginal septum and perhaps a portion of rectosigmoid is a comparatively formidable procedure. However, before deciding to handle suspected endometriosis in the bowel by castration, one must make certain that the lesion is not carcinoma. Moreover, when involvement of the bowel has progressed to a degree producing obstructive symptoms, McGuff and his co-workers[8] have emphasized the excellent results that can be expected without resection.

We would emphasize the variable course of endometriosis in different patients. After a conservative operation, we cannot predict which one may show recurrence or extension requiring reoperation within two or three years and which one will not experience further discomfort for ten years. The age factor is important. Many surgeons, conservative with a 23 year old girl, would tend to castrate a 43 year old woman with equally extensive disease. All surgeons respect the problem of the 30 to 40 year age group, particularly when the patient's distress is due to recurrence a few years after a conservative operation for endometriosis. Here, indeed, is the necessity to castrate or, if all ovarian tissue is not to be removed, to recognize and adequately excise the involved areas. Again to resect ovarian tissue and not free the adherent rectosigmoid from the posterior part of the vagina and cer-

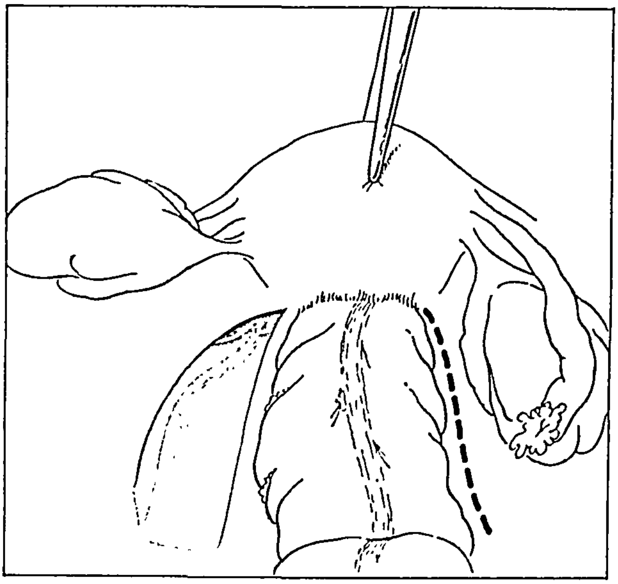

Fig. 2.—Peritoneal flaps should be so mobilized as to avoid injury to the ureter or its blood supply.

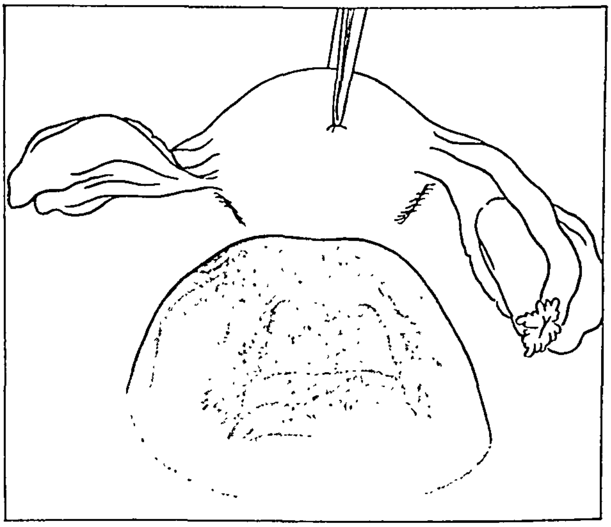

Fig. 3.—The thickened parametrium, particularly the involved uterosacral region, can then be removed.

---

[8] McGuff, P.; Dockery, M. B.; Waugh, J. M., and Randall, L. M.: Surg., Gynec. & Obst. 86: 273, 1948.

vix, to leave ovarian tissue to stimulate implants left in the sigmoid wall or in the uterosacral region or to castrate and then treat the postmenopausal symptoms with estrogens is to invite an early recurrence of symptoms and a rightfully dissatisfied patient.

Effective Conservative Treatment May Require Radical Resection.—When endometriosis is discovered in the cul-de-sac, one should not assume that the disease will progress slowly after a conservative operation and be satisfied to hope that it will appear that one has accomplished more than should be expected from the procedure employed. Too many times, thinking that we were wisely conservative to leave pelvic adhesions undisturbed and the cul-de-sac obliterated, we have amputated the fundus at the internal os and, carefully preserving ovarian tissue, have left endometriosis in the uterosacral region, rectovaginal septum or rectosigmoid, to progress until such time as symptoms justify castration.

We are in complete agreement with Beecham's[9] plea to bisect the involved ovaries of younger women and preserve all the ovarian tissue possible. We are also in agreement when he says that one should not hesitate to do an indicated total hysterectomy because the rectosigmoid is adherent to the posterior aspect of the cervix and vagina. If one intends to be conservative and preserve ovarian tissue in younger women with endometriosis, one should recognize the tendency of this disease to extend retroperitoneally and be prepared to resect adequately at the time of operation.

When we recognized the tendency of endometriosis to invade the uterosacrals and extend retroperitoneally along the parametrium, it surprised us that symptoms due to ureteral compression have not been noted more frequently in this disease. Ureteral obstruction and eventual hydronephrosis, due to endometriosis in the pelvis, have been reported in a few cases. Castration has been the management employed in each instance. However, it is not necessary to castrate the patient to control this complication of the disease. The adnexa can be freed from beneath the broad ligament, after which the underlying parietal peritoneum can be opened (fig. 1). Peritoneal flaps should be so mobilized as to avoid injury to the ureter or its blood supply (fig. 2). When it appears difficult to develop a line of cleavage between rectum and the posterior uterus, cervix and vagina, this important step can often be accomplished, after opening the parietal peritoneum, from a retroperitoneal approach. The thickened parametrium, particularly the involved uterosacral region, can then be removed (fig. 3). Dissection is easier if there is indication to do a hysterectomy at the same time, but it can be accomplished without ligating the uterine artery. It takes more time than castration, but, in younger women, one should remember that the menstrual and reproductive functions usually need not be sacrificed to control this disease.

SUMMARY AND CONCLUSIONS

Endometriosis complicates menstruation and reproduction, but the disease is not often the factor primarily responsible for the frequent disturbances of either genital tract function. In younger women with extensive endometriosis, and those requiring reoperation, the complications develop that constitute present problems.

When castration is permissible, surgical treatment can be avoided by roentgen irradiation. The possibilities of endocrine therapy deserve further investigation. Too many inadequate resections and too much conservative but ineffective surgical treatment has been done in the past. Implants producing cul-de-sac adhesions often infiltrate the muscularis of the bowel wall and extend retroperitoneally along the parametrium, until the induration makes the uterosacral region rigid and occasionally the ureter is compressed. In such circumstances, castration or extensive retroperitoneal dissection is necessary to relieve the patient, and either procedure proves effective.

PANEL DISCUSSION ON ENDOMETRIOSIS

DR. JOE V. MEIGS, BOSTON, MODERATOR

DR. JOE V. MEIGS, Boston: Endometriosis is a common lesion, but the treatment of the lesion and present understanding of it are not very clear. In the past few years we have learned a few things, and I hope that our discussants will be able to carry these points to you. Endometriosis has a lot to do with infertility and also with pelvic pain, dysmenorrhea and the incapacitation of patients. In the nineties, all that was known about it was Dr. T. S. Cullen's work on adenomyosis of the uterus and Dr. W. N. Russell's work on the small piece of tumor he found in the ovary. In 1921, the late Dr. John Sampson presented a fine piece of work, both clinically and pathologically. There are some ideas in Dr. Sampson's presentation that I think need clarification. He said in one or two papers that cure of the disease follows removal of the ovaries. I am personally sure he did not mean that the ovaries should be taken out in every instance. He meant that it might be necessary only in the very bad cases. There are other approaches which should be tried before one does that. His most discussed theory has also been misunderstood. He said that endometriosis arose perhaps in some instances from reflux through the tubes. Dr. Sampson did not say that all cases were caused in this way. He also had other reasons for the causation of endometriosis. Endometriosis has much to do with the economy of our day. Statistics from our own hospital bear that out. It is, I believe, an economic disease.

DR. FRANCIS B. CARTER, Durham, N. C.: The first question is a request for further discussion on adenomyosis located at the cornea and the differential diagnosis from interstitial salpingitis. In 1887, Chiari made, in my opinion, a real contribution by calling attention to this entity and to these nodulations which often were obviously adenomyosis. The English school makes a great point of the nodulations which occur at the corneal areas. That is as much as I know about their diagnosis from so-called interstitial salpingitis. The next question is: Why is endometriosis so infrequently seen after cesarean section? Most cesarean sections should be extraperitoneal, and endometriosis would not be expected in the peritoneum but in the scar. Some scar endometrosis still occurs. That type was common in the days when hysterotomies were done abdominally and the uterus was curetted through the incision in the uterus. I do not know why more endometriosis does not occur. We like to pride ourselves on our technic. We do not have so much spillage into the muscles; they are protected better with our so-called drapes.

DR. CLAYTON T. BEACHAM, Philadelphia: Dr. Meigs has passed me several questions that have come forward. We are asked about the incidence of endometriosis in China, India and the Orient. Gynecologists there tell us that the disease is rarely seen. If we could compare the economic and educational levels of India and the Orient with similar groups in this country, I believe we should find the same incidence. We rarely encounter the disease in hospital ward practice. On the other hand, endometriosis is common in private practice, where the economic level and educational background have led to late marriage and long periods of use of contraceptive methods. Uninterrupted menstrual periods certainly favors the growth of endometriosis. Another question asked is: For the 50 per cent of our private patients who were treated without surgical intervention, how did we make the diagnosis? Medical and hormonal management, which mean the same thing, is employed in young women. We do not want to operate on these girls; we want them to have children. Frequently, the only complaint is dysmenorrhea. The employment of amphetamine N.N.R. (benzedrine®) and/or acetylsalicylic acid will usually afford relief. Pregnancy must be considered the ultimate in endocrine therapy, but why the physiologic amenorrhea causes endometrial implants to regress we do not know. Thus, we advise all these girls when married, even though the economic road is insecure, to become pregnant. The unmarried patients are encouraged to marry as soon as possible and, of course, to use no contraceptive method. The most valuable endocrine preparation we have at hand to enhance the chances of conception is thyroid. Many patients are hypometabolic and yet do not reveal significant basal metabolic changes. The empiric use of thyroid substance seems to favor conception. Testosterone is used for certain patients. Symptomatic relief is often obtained by using 10 mg. daily from the middle of the cycle to the onset of menstruation. If this fails to relieve pain, we may use the preparation throughout the cycle. We have observed several women who conceived while taking testosterone. Patients must be followed carefully while taking this endocrine preparation lest permanent secondary sex changes occur. It should not be used continuously beyond two months.

[9] Beecham, C. T.: Surgical Treatment of Endometriosis, this issue, p. 971.

Dr. Meigs: Many questions have accumulated. The first one is: Will you discuss the mechanism by which endometriosis induces infertility? I think that is explained by the work of Dr. John Rock, Dr. Somers Sturgis and Dr. Westergren. The ovary can move on its ligament. The tube follows the ovary, so that when ovulation takes place the tube is near it and can pick up the ovum. In endometriosis the ovary is often adherent behind the broad ligament in a position which the tube cannot follow. That explains why women with endometriosis are often infertile. The next question: "You stated that infertility accompanies endometriosis and that pregnancy may cure it. How will you make the patient pregnant?" Infertility obviously accompanies endometriosis if the ovary is fixed. If the ovary is released and the endometriosis removed, there is a good chance for ovulation to take place in proper position to the tube. The next question: Does endometriosis occur in married women who have borne one or more children followed by a long period with no pregnancy? It certainly does. This brings up a point I wish to talk about. I have been struck by the great difference in the number of patients with endometriosis, as Dr. Beacham said a moment ago, in private practice versus hospital practice. Eight years ago we investigated 400 patients in my private practice and matched them against 400 in the Massachusetts General Hospital on the gynecologic wards. In private practice, 36 per cent of the patients had endometriosis. In the Massachusetts General Hospital, 8 per cent had endometriosis, the reason for the difference being that the patients from my own practice on whom I had operated were in the age group of 26 and older. These were patients who had married late in life. These were the ones who decided they would rather go to Bermuda the first year they were married than have a baby, and the next year they decided they would rather have a new car than have a baby and the next year they wanted a maid or a new house, or something. They kept putting off childbearing until they were 26 or 27 years of age. In contrast to these were the women on the wards of the Massachusetts General Hospital who married at the age of 18 or 19 or 20 and had many children. I thought perhaps those figures were fallacious, because I was interested in endometriosis and the surgical residents were not, but eight years later I repeated the same study. It is a fact that 35 per cent of the patients in my private practice have endometriosis, and in the Massachusetts General Hospital the figure is 8.75 per cent. I believe that endometriosis is an economic disease of the times, and a serious one. Young persons do not make enough money to have children, and as a consequence they practice some sort of birth control and put off having children. If they put it off, the woman has had at the age of 28, let us say, ten years of menstrual life which she was never meant to have. The monkey in the jungle begins to procreate as soon as she comes of age. We allow our children to protect themselves against having children because of the economics of the times. They cannot afford to have children, when, as a matter of fact, I think they cannot afford not to have them, because if they do not they later come to us gynecologists, and we struggle and work then to try to get them pregnant. Fathers and husbands, if they are in a fair economic position, should see if they cannot give their children money to help them out so they can do as nature intended them to do. The figures I have presented should illustrate the fact that the problem is an economic one. I think it would be a good idea if industry paid more money to the young men who want to get married so they can have children and live normal lives. I think late marriage and infrequent childbearing are the reason for endometriosis. Having been a surgeon for twenty years, I believe if a young patient who wants children has endometriosis of the sigmoid castration is entirely wrong. In these modern days, when we know how to do a sigmoid resection and prepare the patient for operation with antibiotic substances and sulfonamide drugs, I believe we can prepare the patient's bowel, resect the tumor and allow her ovaries to remain so that she may have children. One ought not to destroy a young woman's capacity to have children.

Dr. Randall: A question has been asked as to the dosage of diethylstilbestrol U. S. P. If used as an estrogen in the management of these patients, diethylstilbestrol is frequently administered in a manner calculated to prevent ovulation. Assuming that the effects of progesterone increase the symptoms, particularly the discomforts due to implants of endometriosis, prevention of ovulation, if possible, should decrease the patient's periodic pain. Ovulation can, of course, be temporarily inhibited any given month by giving 1 or 2 mg. of diethylstilbestrol daily for three weeks, beginning about the third or fourth day of the cycle. However, that method represents but one school of thought in using estrogenic substances. A more interesting possibility is based on the observation that, clinically, foci of endometriosis seem to improve remarkably during pregnancy. Since the approximate hormone levels during pregnancy are known, one might try to reproduce these levels by giving 50 to 125 mg. of diethylstilbestrol daily. While this use of the substance has been reported by some investigators, its effectiveness has not been generally appreciated. Another question has come in: Do you think that normal-looking ovaries should be investigated at the time of laparotomy when endometriosis is found in the other ovary? Most of us are of the opinion that implants of endometriosis develop rather slowly. Whenever endometriosis is found in one ovary, if one will bisect the other ovary, even when normal looking, a small area of endometriosis may be found which, when once removed, will not recur. I certainly think that ovarian bisection is worth while, as are efforts to excise endometriosis in the cul-de-sac, whenever it is intended to leave the patient with some ovarian tissue.

Dr. Meigs: We have many more questions, but I think we have all had enough for now. If you will send any further questions to me at the Vincent Memorial Hospital in Boston I will see that they are answered.

Francis Glisson.—In Cambridge the period of the early seventeenth century was marked by the appointment of Francis Glisson (1597-1677) to the regius chair. Glisson's name is familiar to every medical student who reaches the stage of the second M.B. He was a master in the art of exact clinical observation and in the accurate study of morbid anatomy. He began a phase of medicine which was to last for more than two centuries, a period of individual medicine when the physician, with no more equipment than his five senses, his experience, his instinct, and his knowledge, would deduce the diagnosis from acute and penetrating observation and would prescribe such remedies as were known or were believed to be effective. Glisson's name will be familiar to all who are interested in medical history because of his original observations on rickets, or *morbus anglicorum,* and for his classical work on the anatomy of the liver.—Sir Lionel Whitby, M.D., *British Medical Journal,* July 3, 1948.

THE PRIVATE PHYSICIAN AND PREVENTIVE MEDICINE

BRUCE H. DOUGLAS, M.D.
Detroit

The fields of preventive medicine and public health have to a large degree been commingled, so that in the minds of many the terms are more or less synonymous. Some, however, wish to draw a clearcut line between the two. Many physicians seldom stop to think how much of their activity, and how many services they render to patients, are actually preventive in character. These services are usually rendered as remedial of illness and are, therefore, looked on as curative. It is difficult to differentiate clearly among public health, preventive medicine and curative medicine; indeed, it is neither necessary nor really desirable that sharp lines be drawn between them.

Public health is no longer concerned only with environmental factors that influence health. Preventive medicine is not limited to some few specific measures which when administered to individual persons will protect them against certain communicable diseases. Nor is curative medicine solely concerned with restoring health to a patient suffering from some disability or disease.[1] Rather, many things done in any one of these three general fields contribute to all three. For example, the physician who diagnoses a case of typhoid and provides prompt treatment for the illness also realizes that the public health must be protected. First, he has the source of infection investigated by the public health agency; second, he arranges, if necessary, for preventive measures in the form of vaccination of those who have been subject to exposure, if perchance the source is a carrier whose infection cannot be cleared up at once. So without always realizing it as fully as they should, those engaged in these three fields must cooperate and, in the interest of the public health, integrate these phases of medical science.

The public also needs a fuller appreciation of the roles the public health agency and the private physician play in protecting its health. They may realize that the organized community must provide certain things that affect their health, such as a pure water supply and safe milk. It should also be realized that certain protective procedures having to do with individual persons, such as immunization against specific diseases, should be, partially at least, the responsibility of the person to procure for himself and for his family in the same way as food and clothing are purchased. The health officer should recognize this relationship and seek to educate the public to this point of view. He should also seek to organize a health program that will utilize to the fullest extent the services of the private physicians, as well as the facilities of other health agencies in the community, and thus provide for the public health and preventive medical needs of the people. Not all will agree with this concept, for many are of the opinion that all preventive procedures should be furnished through public clinics and that smallpox vaccination, the administration of protective treatments for diphtheria and similar procedures are not the function of the private physician.

THE DETROIT PLAN

In Detroit for approximately twenty years a definite program of participation by the private physician in giving a number of preventive services in his own office has been carried out successfully. This has been variously referred to as the "Medical Participation Plan" or the "Detroit Plan."[2] Many places now use various modifications of this method, and it has become increasingly evident that the public health agency will function most effectively when it works with and has the active cooperation of the private physicians of the community.

Briefly, the method referred to as the "Medical Participation Plan" provides that, as far as possible, those preventive services that consist of technics applicable to the individual person be administered by the private physician. The health department actively cooperates in this plan by education of the public to the need of preventive services and their availability in the community.

This plan entails an understanding and acceptance by the health department, the physician and the public, and each of these three must assume a fair share of the responsibility, if the plan is to succeed.

The Health Department.—The health department must assume responsibility for the application of the programs to be undertaken and in cooperation with the physicians, through their medical society, agree on the steps to be followed. In general, the health department is responsible for the giving out of information to the public regarding the service through the various publicity channels, as well as through personal instruction and direction by public health nurses, who urge those who need the various protective services to go to their private physicians. In addition, the health department distributes (and usually free of charge) the necessary immunizing agents for use by the physicians. The necessary forms for reporting work done are also provided by the official agency. Finally, provision must be made for those unable to pay for the service themselves. This may be done by arranging a modest honorarium for the physician's services in each case that cannot be paid for by the family.

It is also necessary for the health department to acquaint the physician with the details of the plan and the technics to be employed. This may be accomplished through postgraduate conferences, the official publication of the medical society and visits of medical members of the health department staff to the physician in his own office. This personal contact intended to explain the workings of the plan is by far the most effective.

The Physician.—The physician's responsibility is a collective and an individual one. First, through the organization of the medical society, there should be a public health committee available to review and make plans with the representatives of the public health agency for carrying out and coordinating the various programs undertaken. Major matters of policy should be referred from this special committee to the executive council of the society for approval, so that all physicians may know that a given program has the official endorsement of the society. The participating physician assumes responsibility for being equipped to provide the needed preventive services and to explain

to parents and others their value. This type of work is done largely by those in general practice and by pediatricians. Many physicians limiting their work to special fields will not wish to participate in this type of work. Even such a specialist, however, should have an understanding of the programs, and when a mother asks for advice regarding protective treatments for her child, he should not give the impression that it is a trivial matter beneath his dignity as a specialist. Rather, he should show a definite interest and, if not doing such work himself, refer the patient to a participating physician.

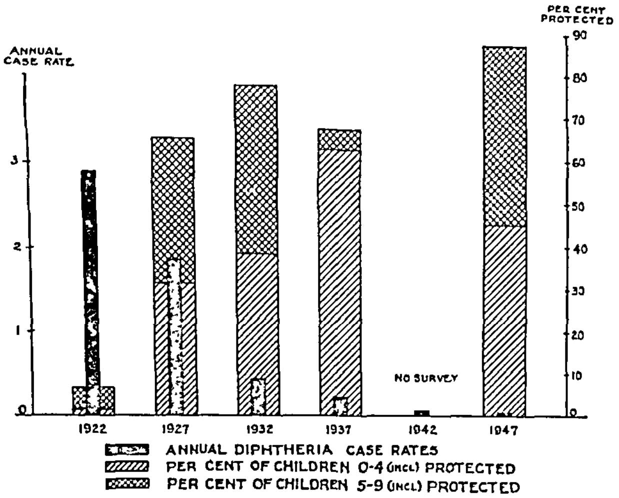

Chart. 1.—Graph showing annual case rate for diphtheria for certain years in Detroit and the percentage of children 0 to 9 years of age protected. Solid black areas represent the annual case rate. Areas diagonally marked indicate the per cent of children 0 to 4 years of age inclusive and cross-hachured areas, the per cent of children 5 to 9 years of age inclusive who were protected against diphtheria.

A busy practitioner rushed with the care of many sick patients can easily give the impression that immunizations, physical examinations and other preventive services are of secondary importance. With the shortage of physicians of the recent war period, it was easily understandable that many physicians fell into this attitude. If such an impression should be passed on to the public extensively, it can readily be seen that a serious failure for a medical participation program could develop. It is of paramount importance that the practicing physician maintain his interest and knowledge of preventive medicine and further that he stimulate his patients. A cooperative program of this type needs continuous public stimulation. It is, therefore, apparent that each physician has a responsibility in making such a program succeed.

The Public.—The public, of course, also has a responsibility in this program, which consists largely in being willing to take part by seeking preventive procedures from the private physician and recognizing them as valuable services which should be purchased just like food, clothing and shelter. In sharp contrast to the costs of medical care for illness, it is possible to predict quite accurately the amount of care and the time when preventive medical service will be needed. Curative medical care is largely unpredictable and, therefore, cannot be provided for as readily in the family budget. The responsibility of the public, then, is largely to have an intelligent understanding of the need for preventive services and to seek them.

RESULTS OF THE PLAN

With this brief presentation of the general plan for medical participation in public health and preventive medicine, it should be of interest to see what has been accomplished through this type of plan.

The protection of children against diphtheria was the first of the specific programs undertaken and the results have from time to time been reported by Geib and Vaughan,[3] who were largely responsible for the development of the "Medical Participation Plan."

This program was started in 1928, at which time it was agreed that no public clinics for the administration of protective treatments against diphtheria would be conducted and that all such treatments would be given in the physicians' offices. An intensive educational campaign was started to acquaint every one with the new plan. Lists of cooperating physicians who were willing to participate were compiled and used to refer parents who had no regular physician. Eleven hundred physicians enrolled during the first two years of the program. This number represented almost all the general practitioners of the community and some of the specialists.

The effectiveness of this program is well illustrated by chart 1, which indicates the advances made by showing the proportion protected in each fifth year since the program began, together with the case rate. The death rate, too, has fallen notably in this period, as shown in the tabulation.

	No. of Deaths		No. of Deaths
1922	201	1937	26
1927	278	1942	10
1932	61	1947	3

1948 (to June 1) 0

It, therefore, has been possible to provide an effective control in a large population and to bring diphtheria to a significantly low point. At the onset of this program designed for the protection of children against certain contagious diseases through immunization, a considerable expenditure by the health department was required to pay physicians for those cases in which the parents were unable to pay. This cost has steadily dropped, however, until now the amount is small without any corresponding decline in the number of protective treatments. The public has, therefore, become aware of the value of such procedures and the physicians have succeeded in incorporating the work into their regular practice.

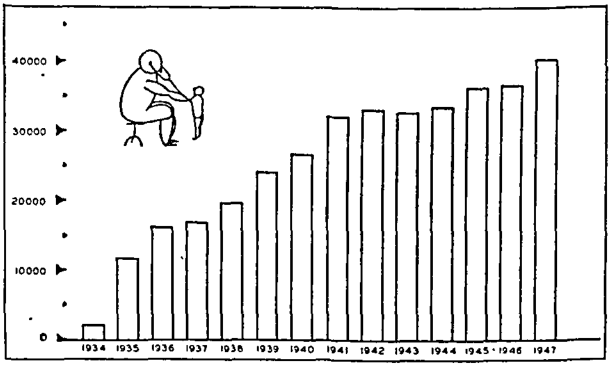

Chart. 2.—Graph showing numbers of physical examinations per year conducted by private physicians on children entering school in Detroit.

---

[3] Vaughan, H. F.: Medical Participation in Public Health Work, Am. J. Pub. Health 22: 933-937 (Sept.) 1932. Geib and Vaughan.[2]

Smallpox vaccination has been carried out in a similar way and with equally good results. The proportion of children who have been vaccinated by the time they enter school is now 81 per cent. There have been no cases of smallpox in Detroit in the last five years.

Vaccination against whooping cough has more recently been added to the participation program, and, while extensive application has been made (65 per cent of children vaccinated at school entrance), the effects on the control of this disease are less spectacular.

School health examinations are included in the medical participation program. The health department provides an examination form which the private physician uses as a guide to the type of examination desired. When he has completed it, it is sent in to the school. These examinations are asked for on first entrance to school, on entrance to intermediate school and in high school. When the school child goes to his own physician for such services, the likelihood of his continuing to consult his private physician after school days are over is considered greater than when he has come to expect such services from a full time school physician. These examinations are not compulsory but are strongly urged. In 1947, 67 per cent of the new entrants to school had been examined by their own physicians.

Chart 2 indicates the growth of this program.

In Detroit a permit from the health department is required in order for one to work as a food handler. One of the requirements for securing such a permit is a physical examination for the detection of possible communicable disease. These examinations are done by private physicians as part of the medical participation program. There are more than 50,000 examinations done each year in this program.

Other activities in the preventive field have been approached in this way with results which demonstrate that the private physician can incorporate preventive procedures into his private practice effectively. The cooperation of the private physician, collectively through his medical society and individually through his own participation with the official public health agency, can provide a community program in public health that is acceptable to the public and effective.

ABSTRACT OF DISCUSSION

Dr. Paul A. Davis, Akron, Ohio: Every physician is, of necessity, a practitioner of preventive medicine and public health, and he should assume this obligation. He should have a record of his patients' immunizations and advise them when they need "booster shots" or reimmunization. As scientific medicine progresses, the multiplicity of injections will be decreased, as in the case of the alum-precipitated combination of pertussis, diphtheria and tetanus toxoids which has now been developed. A portion of my practice entails the immunization of persons going to foreign countries for various periods of time on business. Few countries have the same requirements; the northern countries do not require as strict a schedule as do those situated near the equator. The incidence of typhoid, smallpox, malaria and yellow fever has been greatly reduced, and in the near future a graduate of medicine may never see a case of any of these. This has been accomplished through preventive medicine and the cooperation of the physician in general practice. If such a plan as the speaker has described be made a cooperative one throughout the country, then the incidence of all contagious and communicable disease will be reduced to a minimum, the public will be protected and the cost of medical care reduced. Cooperation and integration of the physician in general practice into preventive medicine and public health plans will accomplish the desired results.

Dr. Winfred B. Harm, Detroit: The general practitioners of Detroit thank Dr. Douglas for taking up this plan of public health service. He has found we are capable of doing the work, and we have found that the Department of Health continues in good feeling with the general practitioners of the community. Because of the good will between the two groups, it has been a pleasure to work with Dr. Douglas; we in Detroit take great pride in the results of the programs of the Detroit Department of Health. Many of you probably do not know that Detroit may no longer take part in the competition for the city health award. We won it so many times that they quit giving it to us.

PRENATAL MATERNAL FACTORS IN MONGOLISM

CLEMENS E. BENDA, M.D.
Waverley, Mass.

In the etiology of mongolism, two problems must be distinct: (1) the causes leading to the abnormal development of the embryo and (2) the abnormal factors operating in the embryo to produce the characteristic growth disorder. The present study deals only with the former problem, the prenatal maternal condition. Since mongolism is present at birth and the characteristic anomalies date back to early stages of fetal development, the causative factors are either of a genetic nature or environmental factors operating in the mother during gestation.

Table 1.—*Increase in Percentage of Mongoloid Births with Increase in Maternal Age*

	Maternal Age, Yr.					
	20 to 24	25 to 29	30 to 34	35 to 39	40 to 44	45 to 47
Percentage of mongoloid births........	0.082	0.152	0.236	0.857	4.242	12.5

In 1939, Benda, Dayton and Prouty[1] presented a study of 250 pregnancies each resulting in the birth of a mongoloid child. An analysis of the material produced evidence that mongolism is not due to genetic factors. The material indicated also that neither a germ mutation nor a primary inferiority of the ova was an acceptable explanation. These conclusions were based on the following facts: 1. The frequency of occurrence of a mongoloid child increases in proportion to advanced age of the mother. While 1 mongoloid child may be expected among 8,000 births if the mother is between 20 and 24 years of age, the incidence increases to 12.5 per cent if the mother's age is between 45 and 47 years. This was impressively demonstrated in a table prepared by Bennholdt-Thomsen.[2]

2. A study of the birth order of mongoloid children shows that in large-sized families, the monogloid child is found near the end of the line of siblings. A mongoloid child was never born at the beginning of a sequence of six to fifteen children, while other congenital defects occur at any place of the birth order (Benda[3]).

This paper was presented at the First International Congress on Mental Deficiency, Boston, May 18 to 22, 1948.

Dr. Benda is director of research and clinical psychiatry, Walter E. Fernald School, Waverley, Mass., and instructor in neuropathology, Harvard Medical School, Boston.

[3] Benda, C. E.: Mongolism and Cretinism, New York, Grune & Stratton, Inc., 1946.

3. As Macklin and Snyder[4] stated:

> . . . When the sibship consists of five or less, a random group of families will have a majority showing only one affected offspring. It is not until the sibship size increases to six that one would expect more instances of two or more children affected than of one affected.

The aforementioned study[3] included 79 cases in which the mongoloid child was born in a family with six or more children and 50 cases were added from the material of the Finnish investigator Lahdensuu. Of 429 families, 31 per cent, or 129, had six or more children without a single instance of multiple mongolism. This is sufficiently significant statistically to indicate that hereditary factors can be ruled out. There are, however, cases of more than one mongoloid child in a family. These cases require a different explanation.

TABLE 2.—*Data on Women Having Mongoloid Children at 41 to 52 Years of Age*

Case No.	Age of Mother	Number of Previous Children	Previous Abortions	Menstrual History	Bleedings During Pregnancy	Interval Before Pregnancy Occurred, Yr.	Physical Condition of Mother	Mental Condition	Comment
1	50	7	Unknown	Irregular; "change of life"	None	3	Hysterectomy performed after birth	Fair	
2	52	8	One before this child; one before last	Irregular; "change of life"	None	9	Felt "deadly ill"; "different from other pregnancies"	Fair	
3	43½	2	Two previous to this pregnancy	Regular	None	10 since living sibling; 4 after one born dead	Fibroid of uterus; last child died at birth	Fair	
4	43	1	None	Menstruation "overdue" several times; Hemorrhages	None	10	Fair; pregnancy occurred after injection of estrone U. S. P.	Fair	
5	43	2	None	Had stopped menstruating; "change of life"	None	11	Pregnancy not recognized until fifth month	Fair	Never menstruated regularly afterward
6	45	3	*Unknown*	*Menopause*	Unknown	16	Pregnancy not expected; menopause	Fair	Mother (case 33) listed in table 3
7	42	2	None	Regular	Attempted abortion unsuccessful	11	Retroflected uterus; previous thyroid infection (abscess)	Fair	Took ergot tablets for several weeks after skipping first menstruation
8	40 10/12	1	Two	Regular	Threatened abortion	2	Thyroid deficiency; threatened abortion treated with "antuitrin"	High-strung; nervous	
9	42	1	None	Regular	None	11	Gallbladder trouble; severe vomiting; weight loss throughout pregnancy	High-strung; nervous	
10	41	None	None	Regular	None	4	Had spastic infantile paralysis	Fair	
11	43	3	None	Irregular last 4 years; "change of life"	None	7	Twin pregnancy; other twin dead; (weight 9 lb.); mongoloid weighed 8½ lb.	Fair	
12	43	2	None	Menopause for several years	None	12	Pregnancy not recognized until fifth month	Fair	
13	46	11	One	Menstruated until age of 52 years	None	4	Thought to be beyond age	Fair	

4. The observations on twins of whom both or one is a mongoloid are not conclusive.

5. The theory that mongolism develops from the fertilization of an abnormal "overaged" ovum can not be entirely excluded by present methods. The material seems, however, to indicate that extrinsic factors, operating at a later date, seem of more importance.

The conclusion was offered that the common denominator for all conditions under which mongolism develops is a "threshold condition of hormonal sterility":

> The maternal organism appears to be unable to produce the proper endocrine environment for the embryo. The necessary adjustments are either delayed or insufficient, the result being that the fetus is deprived of a number of nutritional factors which are essential for its proper development. The maternal condition is due either to the approach of the menopause (women beyond 40 years of age) or to an insufficient response to fertilization (young women, or women above 30 who had no children before). There is a third group of cases in which mongolism occurs on account of the fact that an intercurrent illness has rendered the mother temporarily unfit for a pregnancy (p. 832).[1]

Since Gregg and a number of other scholars (Wesselhoeft)[5] published their observations on the importance of virus diseases in the production of congenital malformations, the general interest in problems of prenatal health and hygiene has greatly increased. Of all abnormal prenatal conditions, mongolism takes the largest toll among the normal population; about 3 children in every 1,000 births in a general lying-in hospital are affected with mongolism. While the importance of prenatal factors for the health of the newborn is increasingly recognized, many pediatricians and obstetricians show a respectful skepticism toward the data so far presented and seem to feel that the material is not yet conclusive.

From previous studies of more than 325 case histories (Benda),[3] it was concluded that certain factors seem to appear in repetition and should be the subject of further investigation by a method of personal interviews with the mother. A questionnaire was designed which contained the most important questions, but each interview was conducted after personal contact had been established and details were gathered independent from the questionnaire.

Table 3.—*Data on Women Having Mongoloid Children at 31 to 40 Years of Age*

Case No.	Age of Mother	Number of Previous Children	Previous Abortions	Menstrual History	Bleedings During Pregnancy	Interval Before Pregnancy Occurred, Yr.	Physical Condition of Mother	Mental Condition	Comment
14	35	2	None	Normal	At end of second month	4	Gallbladder attacks (removed after birth of child); felt ill first 3 mo.	Depressed	
15	39	None	None	Normal	None	7	Felt ill	....	
16	31	None	None	Normal	Massive hemorrhage at 3 mo. lasting 9 days	2	Gallbladder trouble; removed after delivery	....	2 mo. rest in bed; hormone treatment
17	31	None	None	Normal	None	3	Severe vomiting in second month	Depressed	
18	35	None	Two	Normal	Slight bleedings	7	Fair		
19	35	2	None	Normal	Placenta previa	5	Fair	....	Placenta previa in previous pregnancy also
20	33	None	One; menstruated once before this pregnancy	Normal	None	Unknown	Thyroid deficiency; low metabolism; heavy weight	Slow; forgetful	Took 2 gr. (0.13 Gm.) thyroid, alternating with 1 gr. (0.06 Gm.)
21	37	3	None	Abnormal (see comment)	At first two menstruations	..	History of Graves' disease; miserable; heart murmur	Depressed; nervous	No menstruation for 4 mo. of year before
22	39	None	Two	Normal	None	9	Fair	Depressed; worried; divorce case	
23	33	1	None	During adolescence no menstruation for 4 years	None	3	Thyroid deficiency; metabolism —40; dry skin; headaches; tired	Fatigue	Treated with thyroid during pregnancy
24	37	3	Menstruation 6 weeks overdue before this pregnancy	Irregular; 20 to 22 days	Several near end of pregnancy	5	Placenta previa; fibroid uterus removed after delivery	....	
25	36	2	None	Irregular; twice monthly	None	9	Twin pregnancy	Depressed; lost weight	
26	37	1	Two (severe bleedings)	Irregular; sometimes 5 mo. without	None	5; artificial enlargement of cervix	Severe vomiting; pains; fibroid in uterus	....	Waited 4 yr. before first child
27	39	1	None	Irregular	None	11	Thyroid deficiency suspected	Easily upset, nervous	3 sisters treated for thyroid deficiency
28	37	None	None	Normal	First menstruation slight	9	"Swelling of thyroid" diagnosed at 18 yr.; ovarian cysts; thin; lost weight	Nervous	Married 9 yr. without child
29a	36	1	Two	Normal	None	10	Uterus damaged in first pregnancy by high forceps; no pregnancy for 5 yr.	Nervous; weighs 88 lb. (39.9 Kg.)	Two mongoloids in same family
29b	40	3	Two	Normal	None	2	Very thin; worn out	....	Normal child between
30	37	4	None	Normal	Bleedings at 3 mo.; again at 8 mo.	4	Placenta previa; in bed for 2 mo.	....	Fourth child died of placenta previa before mongoloid
31	36	None	None	Normal	Threatened abortion after 2 mo.	7	Migraine; high metabolism; ovarian cysts	....	
32	33	None	None	Irregular	Bleedings in sixth week after start of pregnancy	1	Retroflection of uterus; cyst of uterus; low metabolism (—12); hypothyroidism	....	Treated with thyroid ½ gr. (0.03 Gm.) 3 times daily
33 (daughter of mother in case 6)	36	1	None	Irregular in younger years; no menstruation when under stress	None	10	At 27 yr., one ovary removed; takes ovarian hormones; hyperactive thyroid	Nervous	6 to 9 drops iodine daily during pregnancy
34	35	None	None	Very irregular; went 2 to 3 mo. without	Menstruated 4 times during pregnancy	12	Hypothyroid; one ovary removed; other partly removed five years before	....	Time of impregnation known; husband on furlough 5 days

Of the last 10 patients who were examined, but who were not included in the statistical evaluation, 8 had a definite history of difficulties during pregnancy. Six examples may be cited:

HISTORIES OF CASES

Case 1.—The woman's age at the birth of the mongoloid child was 32 years. She had been married in 1939. Her first pregnancy, in 1941, ended in miscarriage in the second month. The second pregnancy was terminated by miscarriage in the third month. The third pregnancy, in 1945, was terminated by the birth of a premature baby in the seventh month. The baby died five hours after birth. The fourth pregnancy, in 1947, ended in the birth of a mongoloid child. The mother's menarche was at the age of 14. Her menstruation was irregular in the first year, occurring only three times, after which it was normal. A fibroid tumor was removed in 1944 after the second miscarriage, together with the appendix.

Case 2.—The maternal age at the birth of the mongoloid child was 33 years. The first child died three days after birth with the diagnosis of hemorrhagic disease. The second pregnancy was terminated by miscarriage in the third month. The third pregnancy was terminated by miscarriage in the fourth month. Before the mother became pregnant again, the physician told her she was "run down." She was treated with thyroid and multiple vitamin preparations, including vitamin E. She became pregnant again and was treated throughout pregnancy with vitamins and corpus luteum hormone. The result of this pregnancy was a normal, very active child. The fifth pregnancy occurred three years later, with no treatment. A mongoloid child resulted.

Table 4.—*Data on Women Having Mongoloid Children at 21 to 30 Years of Age*

Case No.	Age of Mother	Number of Previous Children	Previous Abortions	Menstrual History	Bleedings During Pregnancy	Interval Before Pregnancy Occurred, Yr.	Physical Condition of Mother	Mental Condition	Comment
35	30	None	None	Regular	Slight bleedings and pains in 3d and 4th menstrual cycle	2	Thyroid enlargement; question of goiter	Tired; tense; highstrung	
36	27	1	None	Regular	None	4	Thyroid deficiency diagnosed 7 yr. ago (basal metabolic rate, —27); treated 3 mo.	Tired; slow	Dry skin and some evidence of mild hypothyroidism
37	30	None	None	Regular	Some bleeding in first menstruation	6	Albuminuria; high blood pressure (170 systolic)	Migraine attacks	
38	28	None	None	Irregular	None	4	At 6 weeks; electric shock in bath tub; house painting 4 mo.	Felt miserable	Nervous breakdown at 15 yr. before menarche
39	24	None	None	Regular	Attempted abortion; 2 days' bleeding	1	Took pills until bleedings started	Rejected pregnancy; artificial abortion attempted; became scared	"Salvaged abortion"
40	24	None	5 mo. before this pregnancy	Regular	None	2	Severe vomiting first 4 mo.	Felt miserable first half of pregnancy	Pregnancy followed abortion; another 2 yr. later
41	30	1	One	Regular	None	5	Thyroid deficiency; gained weight	....	One of twins
42	29	None	None	Irregular	3d and 4th mo. bleedings, 2d missing	1	High blood pressure; strict diet maintained; infantilism	Easily upset	
43	27	None	One	Regular	None	2	Thyroid deficiency treated previously; overweight	....	"Hormonal treatment from 3 mo. to end of pregnancy"
44	25	None	Two	Irregular cycle of 5 wk. or more	None	3	Pernicious vomiting from beginning of pregnancy; contracture of uterus; 5 mo. in bed	....	Last two previous pregnancies caused "pernicious vomiting"
45	28	2	Two before, one after mongoloid child	Regular	None	1	Last miscarriage left blood clots; curattage	Irritable; weak	
46	25	None	None	Regular	At end of 3d month	3 after marriage	Right salpingectomy 2½ yr. before this pregnancy	....	Progesterone "proluton" injections for 3 mo.
47	25	None	None	Regular	None	..	Thyroid deficiency diagnosed 6 yr. before; took thyroid	Easily upset	Thyroid treatment

Data on Women Having Mongoloid Children at 18 to 20 Years of Age

Case No.	Age of Mother	Number of Previous Children	Previous Abortions	Menstrual History	Bleedings During Pregnancy	Interval Before Pregnancy Occurred, Yr.	Physical Condition of Mother	Mental Condition	Comment
48	18	None	None	Irregular; twice monthly	Menstruated in 2d and 3d mo.	1	Later operated on for abscess of ovary and tubes removed	Highstrung; nervous	
49	18	None	None	Irregular to time of pregnancy, lasting 7 to 24 days	Threatened abortion in 7th mo.	1	Malaria at 11 yr.; liver trouble	Depressed	
50	20	None	None	Regular	None	2	Did not become pregnant until treated with estrogens	....	

Case 3.—The maternal age at the birth of the mongoloid child was 27 years. The mother started to menstruate at the age of 11 years, but menstruation stopped before she was 12 years old. It remained irregular and was usually delayed. Her only pregnancy was at the age of 27. It terminated in the birth of a mongoloid child. Afterward, she underwent a medical study through which her condition was diagnosed as pituitary deficiency. She was only 4 feet 11 inches (149.9 cm.) tall, with a slim, infantile and delicate body build. During her pregnancy she suffered from excessive vomiting day and night and was kept in bed for several weeks. Since she was under pituitary treatment, she menstruated regularly during the last sixteen years. However, she never became pregnant again.

Case 4.—The maternal age at the birth of the mongoloid child was 24 years. The mother's menarche was at 12 years of age, but menstruation was never regular up to her first pregnancy. In the third month of the pregnancy she had a severe hemorrhage and was kept in bed for a month. In a later period of the pregnancy smaller bleedings occurred. Three weeks before term, another severe hemorrhage started and the baby was delivered by cesarean section. The diagnosis was placenta previa.

Case 5.—The maternal age at the birth of the mongoloid child was 35 years. The mother was married in 1941. The pregnancy occurred soon afterward. At the sixth week of pregnancy she had a rather severe hemorrhage and was kept in bed for one month. In the sixth month of pregnancy several more bleedings occurred after a light fall. The pregnancy terminated in the birth of a mongoloid child. The next two pregnancies in 1943 and 1944 both terminated in miscarriages at six weeks. The woman was 5 feet 6 inches (167.6 cm.) tall, weighed 187 pounds (84.8 Kg.), having previously weighed more than 200 pounds (90.7 Kg.). She was nervous and highstrung and her appearance suggested an endocrine deficiency.

Case 6.—The mother was married in 1930. The first child, a normal girl, was born in 1932. The parents practiced contraception for about four years, but decided then to have another child. No pregnancy took place for another four years. When the mother became pregnant, she continued to menstruate through the first three periods and did not realize that she was pregnant. A severer hemorrhage occurred at the end of the third month, when the diagnosis of pregnancy and threatened abortion was made. Treatment consisted of rest in bed. The woman was unusually heavy, weighing 194 pounds (88 Kg.). Her height was about 5 feet 5 inches (165 cm.). She was fat, tired and nervous, and her appearance suggested hypothyroidism.

MATERIAL

The 50 new case histories which are presented in the following tables are the result of fifty-four interviews. Four instances in relatively young women were excluded because no explanation could be found. In the previous studies, about 10 per cent of the cases could not be explained. The remaining 50 cases were divided into four groups according to age, and the results are tabulated in tables 2 to 4.

EVALUATION OF OBSERVATIONS

I have emphasized on various occasions that mongolism is not a malformation or "monstrosity" (Ingalls),[6] but a deceleration of normal growth during the fetal period from about the sixth to the fourteenth week. At the time of most intensive fetal growth, some factors seem to slow down the growth rate, with the result that certain developments which usually take place in a matter of days are not properly completed. Failure to complete certain basic developments in fetal life cannot be fully corrected in a later period. In mongolism a temporary retardation or deceleration of growth occurs which makes the mongoloid newborn infant a physiologically "immature," "ill finished" baby.

TABLE 5.—*Percentage Incidence of Significant Symptoms in Each Age Group*

Age Group of Mothers, Yr.	Menopause or Menstrual Irregularities Before Pregnancy, %	Long Interval (3 to 16 Yr.) Before Birth, %	Bleedings During Pregnancy, %	Thyroid Troubles, %	Uterine and Ovarian Anomalies %	Placenta Previa, %	Incidence of Previous Abortions, %	Twin Pregnancy, %
41 to 52	53.9	92	0.8	0.8	15.4	0	36.2	0.8
31 to 40	47.6	81	48.8	38.5	63.5	14.3	19.0	0.8
21 to 30	23.1	46	38.5	38.5	23.0	0	38.5	0.8
18 to 20	67.0	33	67.0	0	0	0	0	0

In studying the factors leading to such decelerated growth, I postulated that there cannot be one uniform "cause" because the constellation of factors differs in various age groups. The most outstanding symptoms are tabulated in table 5.

In the age group of 40 to 52 years, 53.9 per cent of the women were actually in the menopause and pregnancy occurred against expectation. Pregnancy was frequently not recognized until about five months had passed. The fact that these women were beyond the child-bearing period is further emphasized by the long interval between previous pregnancies and the last one. With the exception of 2 women with an interval of two and three years, respectively, all intervals ranged from four to sixteen years; 9 women, or 69 per cent, had an interval of seven years or more.

If mongolism is considered due, not to a single cause, but to a constellation of abnormal factors, it must be realized, that in each case, there is a concurrence of several symptoms of varying significance. Aging of the female organism leads eventually to cessation of the menstrual cycle, to involution of the ovary and of the uterine mucosa and to a general loss of adaptability. Of the 13 women above 40, 4 were above 45 and 3 had actually stopped menstruating (cases 1, 2 and 6). One woman (case 13) menstruated until the age of 52 and the particular factors working in this instance are not clear. Of the 5 women aged 43, 4 had actual signs of menopause (cases 4, 5, 11 and 12), while in 1 (case 3) two previous pregnancies terminated in abortions and the last full term baby died at birth. The mother had a fibroid tumor of the uterus. Of the remaining 4 women between 40 and 42, one attempted unsuccessful abortion and 1 had a threatened abortion. One woman (case 9) was without child for eleven years; she had severe gallbladder trouble. Another woman, a small, short person with a conspicuous curvature of the spine, was the victim of earlier poliomyelitis.

Many physicians consider mongolism as something outside the realm of possbilities which could not occur in their families or in those of their friends. It must be emphasized that any normal mother is potentially the mother of a mongoloid baby, if she is approaching menopause or carries her child under certain adverse conditions. A glance at the group of mothers who had a mongoloid child after the age of 41 shows that they were average to superior citizens who constituted a healthy portion of the population. The 13 mothers had previously given birth to forty-three living children. Eight of them, or 61.5 per cent, had two or more children. The siblings of the mongoloid children were all normal. Many were honor students in schools or universities, successful soldiers or married women. The women who had a mongoloid child after 41 years of age had a normal menstrual history and, as a group, were mentally sound and well adjusted. Physical examination showed no significant anomalies; only those illnesses were encountered which one might expect in any sample of adults of that age group.

If the assumption is correct that a mongoloid child can be the result of any pregnancy in which there is an abnormal biologic response to impregnation, brought about by the physiologic aging of the maternal organism beyond the age of 41, then one may look for factors with a similar effect in those women who have a mongoloid child in their thirties or twenties.

As table 5 shows, the most outstanding symptom in the age group of 31 to 40 is the slow fertilization time. In the majority of cases the information was given that the mother had wanted a child, but in spite of her desire no pregnancy had occurred. As may be seen from the table, in the maternal age group between 31 and 40, 17 of 21 women, or 81 per cent, had a waiting time of three years or more, and 13, or 62 per cent, waited from five to twelve years for the birth of a child who was frequently the first or second one. It has not been sufficiently emphasized what it means to parents in their thirties who are mature, economically established and anxious to have children, when they have to wait five to twelve years for a pregnancy in spite of regular intercourse and opportunities for impregnation. In 10 cases, or 48 per cent of this group, the mongoloid was the first child, after such a waiting period. This fact, to which I called attention as the "inability to become pregnant," is of great clinical significance; it indicates either lack of fertility or inability to maintain a pregnancy. In this connection the histories of previous abortions (15.7 per cent), bleedings during pregnancy (48.8 per cent) and menstrual irregularities in preceding years (47.6 per cent) are of increased importance. Bleedings during pregnancy occurred in almost half of the cases. These bleedings appeared in two ways. A number of mothers reported that they had continued to menstruate during two or three months of pregnancy and that they had, therefore, not been sure they were pregnant. Some skipped one menstruation and menstruated again at the end of the second and third month.

---

[6] Ingalls, T. H.: Pathogenesis of Mongolism, Am. J. Dis. Child. 73: 279 (March) 1947.

In other cases, the history indicated definitely a threatened abortion, which was treated by the attending physician. The 48.8 per cent of hemorrhages in that age group compare with figures on threatened abortion in the general population given by Rutherford (4 per cent)[7] and Paine (3.8 per cent).[8] Even though Hertig and Livingstone[9] were of the opinion that the percentage of threatened abortions is slightly higher in private practice, this unusually high number in cases leading to the birth of a mongoloid child deserves attention. Beidleman[10] also observed an increase of threatened abortions in his study of mongolism in the Boston Lying-In Hospital. In all age groups together, his percentage was 23.

Indication of hormonal abnormalities is further given by the high percentage (47.6) of menstrual irregularities before pregnancy. A clue as to the type of endocrine disorders which may be of some significance is the high percentage of thyroid disorders reported in the histories. The present series shows a percentage of 38.5. Although reliable control material is not immediately available, the percentage is much higher than one may expect in a group mainly observed in an Eastern border state. That the material is significantly increased is shown by the fact that the mothers of mongoloid children between 21 and 40 years of age had known thyroid dysfunction in 38.5 per cent, while in the age group above 41 years, only 1 woman with the condition was reported. If thyroid dysfunction were a common disease in the population in general, the older age group should have a higher percentage of histories of thyroid dysfunction than the younger age groups. Moreover, the material includes only women treated by physicians for this deficiency, while the appearance of several others seen at interviews suggested similar difficulties. If thyroid deficiency in the mother is of some significance, then the incidence of mongolism should increase according to the geographic distribution of thyroid deficiencies. Myers[11] (Toronto) reported a frequency of recognized thyroid disorders of 9 to 1, compared with a control group of the same size and kind. From this he concluded the possibility that mongolism is related to maternal thyroid disorders:

> . . . If so, it is reasonable to expect that mongolism will occur somewhat more frequently in those areas in which thyroid disorders are more frequent.

In mapping out the distributions of mongoloid births and of instances of death due to diseases of the thyroid gland, Myers determined the geographic areas of the province of Ontario, Canada, with highest thyroid rates: The proportion of cases of mongoloid children, born in the area of highest "thyroid rates" was "43.1 % . . . as compared with 24.6 % for the control group." Myers not only considered this a significant statistical difference but expressed the view that the same factor may explain the greatly reduced fertility of the mother giving birth to a mongoloid child. According to Hoskins,[12] the thyroid ranks second only to the pituitary as a cause of involuntary sterility in human beings. These observations may possibly serve to explain the multiple incidence of mongolism in some families.

The new series of cases contains 1 instance of mongolism in two generations. This patient (case 6) had a mongoloid child during her menopause, having given birth previously to three normal children. The mongoloid child was born at a maternal age of 45 after an interval of sixteen years. One of the daughters (case 33) gave birth to a mongoloid child at the age of 36. She gave birth to one normal child but had no other child for ten years. She was treated for hyperthyroidism and one ovary was removed. After the operation, she was said to have had insufficient ovarian function and was treated with ovarian hormones as substitute therapy throughout the years. One patient (case 27) reported that three of her sisters were treated for thyroid deficiency. Another patient (not included in this material) gave a similar history:

> A 24 year old pretty, but overweight, woman had a mongoloid as her first child. The woman was slow and somewhat inactive. In spite of little eating, she gained 20 pounds (9.1 Kg.) during pregnancy with her mongoloid child, who weighed only 5 pounds (2,268 Gm.) at birth. Her sister, a married woman of 25, is unable to become pregnant and is now under treatment for thyroid deficiency.

Of the women 63.5 per cent had a history of previous uterine or ovarian disturbances. Placenta previa occurred in 14.3 per cent of the pregnancies.

Proceeding to a discussion of the group of mothers who had a mongoloid child in their twenties, one finds the same constellation which was observed in the age group above 31. The incidence of thyroid disorders was 38 per cent. Difficulties in becoming pregnant were seen in 46 per cent. Bleedings during pregnancy occurred in 38.5 per cent and an irregular menstrual history was given in 23.1 per cent. The incidence of previous abortions (38.2 per cent) with 2 instances of two abortions each is also significantly high. While the long waiting time in this age group is less conspicuous, because of the youthfulness of the women, the constellation of factors is identical and bears out the importance of an early recognition and treatment of this condition.

The last group of mothers, those 18 to 20 years old, is too small for percentage evaluation. With 3 cases previously observed, the material on 6 cases indicates irregular menstrual cycles before the time of pregnancy as the most frequent causative factor. Threatened abortion occurred four times in 6 cases.

Worth mentioning is 1 case of multiple mongolism (cases 29 *A* and *B*). This brings the total number of instances of multiple mongolism in the same family to 3, in a series of 385 cases. That this mother's offspring were successively normal, mongoloid, normal and then again mongoloid does not prove the presence of "genetic factors," but makes one wonder whether improved, though not perfect, prenatal conditions may not increase the number of "salvaged abortions," with the possible result of more such multiple instances of mongolism.

There were 3 instances of twin pregnancies in which one twin was a mongoloid child. In 1 instance, the sibling was dead. It is my conviction that these cases do not favor a genetic interpretation of mongolism or shift the weight of evidence toward such an interpretation.

SUMMARY

1. After the publication of two previous studies examining 250 and 75 cases, respectively, the present investigation covers a series of 64 new cases. Six cases were discarded as "without explanation." In 8 to 10 per cent satisfactory data could not be obtained, either because information was withheld or because only a thorough physical examination and clinical study could produce the necessary facts. Fifty cases were divided into four groups according to age. The results are tabulated in tables 2 to 5.

2. In the first age group, the mother was within or near the menopause. In 69 per cent she had not given birth to a child for a long time (seven to sixteen years). Uterine and ovarian dysfunction and previous abortions indicate an impaired generative faculty which developed in a previously healthy woman who, in the majority of cases, had given birth to normal children previously.

3. Mongolism is not a "monstrosity," but the result of a deceleration of the developmental rate during certain weeks of the gestation period (end of organogenetic period, from the sixth to the fourteenth week). The result of such interference with the developmental rate is an immature, "ill finished" child.

4. Potentially, mongolism can be the outcome of any pregnancy, if a constellation of factors occurs which produces a threshold condition of sterility.

5. The most frequent constellation of an abnormal pregnancy response is produced by advanced age. Of the women having a mongoloid child after 41 years of age, 53.9 per cent showed actual menopausal symptoms. Age produces a physiologically changed ovarian activity and uterine responsiveness. It is suggested that such a constellation facilitates the slowing down of fetal development due to abnormal nutrition.

6. Since 45 per cent of the instances of mongolism, however, occur in a maternal age group below 40 years of age, who are well fitted for procreation, age alone cannot be the decisive factor.

7. Analysis of 21 instances in a maternal age group of 31 to 40 and of 13 instances in a maternal age group of 21 to 30 shows that certain constellations of factors may be expected to operate in all women who give birth to a mongoloid child in their twenties and thirties. The most significant symptoms are: inability to become pregnant, impaired hormonal regulation, bleedings during pregnancy, menstrual irregularities, previous abortions and uterine and ovarian anomalies. These symptoms are the result either of local conditions in ovary and uterus or of an endocrine inadequacy of the corpus luteum. Thyroid anomalies are so frequently seen that they are an important link in the chain of events. The common denominator is a threshold condition of sterility.

8. The material includes 1 case of mongoloid children in two generations, 1 of multiple mongolism and 3 cases of twin pregnancies, resulting in one mongoloid, the twin being either normal or dead. It is pointed out that this material does not favor a genetic interpretation. It is, however, possible that thyroid deficiencies on either a geographic or a genetic basis are significant.

9. Mongolism, occurring about 3 times in every thousand births, is a condition which deserves more medical attention. As it is a "decelerating" growth deficiency in the prenatal period, still manifest in infancy, therapy has to concentrate on factors which may increase the developmental rate of the newborn. Although no definite cure is available, effective experimental treatment aiming at an increase of the growth rate (physical and mental) must start as early as possible.

10. The main problem of mongolism is its prevention. With increased knowledge of those prenatal factors operating during gestation and resulting in malformations or deficient growth rates, careful observations must be collected with regard to all circumstances which may condition abnormal fetal growth. The present study offers new evidence that mongolism is due to an abnormal maternal condition during the early part of gestation. It offers some clues as to the nature of the anomalies and postulates further investigations as to their specific mode of action.

THE DIAGNOSIS OF COARCTATION OF THE AORTA

WILLIAM L. PROUDFIT, M.D.
and
A. CARLTON ERNSTENE, M.D.
Cleveland

One of the most important advances in surgery in recent years has been the development of technics for the cure of certain forms of cardiovascular disease. A new addition in this field is a procedure for treatment of coarctation of the aorta of the adult type. In this anomaly a short segment of the aorta in the region of the ligamentum arteriosum is constricted and the lumen of the vessel reduced, usually to a diameter of 6 mm. or less. The circulation to the portion of the body below the level of stenosis is maintained by anastomoses between branches of the subclavian and axillary arteries and the intercostal arteries which arise from the aorta below the site of constriction.

In the past, recognition of coarctation of the aorta was of academic interest only, but because a form of surgical treatment is now available, its detection has become a matter of practical importance. Diagnosis is not difficult in most cases, but in order to avoid errors it is necessary to include a few simple procedures in every physical examination and regularly to note certain features when interpreting roentgenograms of the thorax.

From the Cleveland Clinic and the Frank E. Bunts Educational Institute.

Read before the Section on General Practice at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 25, 1948.

Although an occasional patient with coarctation of the aorta lives to an advanced age, Reifenstein, Levine and Gross [1] found in a recent study of 104 autopsied patients that 61 per cent of them died before or during their fortieth year. The commonest causes of death were rupture of the aorta, congestive heart failure, intracranial hemorrhage and bacterial endocarditis or aortitis. The first three of these conditions occur because the arterial pressure is almost always elevated in the arms in coarctation and, consequently, in the cerebral vessels and ascending aorta. In children and adolescents, a successful operation results in correction of the hypertension in the upper part of the body and, therefore, can be expected to bring about a decided improvement in the life expectancy of these patients. In older persons, some residual elevation in blood pressure may remain after operation. For this reason, and because the diminished elasticity of the aorta in patients over 20 years of age may add considerably to the difficulty of the surgical procedure or even make correction impossible, it is important that the diagnosis of coarctation be made as early in life as possible.

Summary of Observations on Patients with Coarctation of the Aorta

Sex	Age, Yr.	Blood Pressure, Mm. Hg		Collateral Vessels Visible or Palpable	Scalloping of Ribs	Enlargement of Heart	Aortic Knob Diminished or Absent	Dilatation of Ascending Aorta

MATERIAL AND OBSERVATIONS

A series of 24 consecutive patients with coarctation of the aorta of the adult type has been reviewed, with particular reference to those findings on physical examination and in the roentgenograms of the thorax which are of diagnostic value (table). The age of the patients ranged from 8 to 41 years. Twenty were males, and 4 were females. Eighteen of the 24 were referred to the clinic because hypertension had been discovered during an earlier examination. Three others were aware of elevated blood pressure but were not admitted to the clinic for this reason. In only 2 persons had the diagnosis of coarctation of the aorta been made previously.

Symptoms.—The symptoms reported by the patients were of little diagnostic help except in a few instances in which they indicated the presence of some form of cardiovascular disturbance. Twelve persons had experienced headache, but in none was this the chief complaint. Seven had had epistaxis, but in only 1 had this been troublesome. One had bled excessively after tonsillectomy and again after a tooth extraction. Palpitation had been noted by 8 patients, and 5 had experienced dyspnea on moderate or severe exertion. Attacks of angina pectoris had occurred in 2, one a woman, aged 29, and the other a man, aged 34. The latter patient also had suffered from acute myocardial infarction one week before he was first seen. Symptoms of circulatory insufficiency in the legs were not common. Only 1 patient complained of typical intermittent claudication, but 1 other reported easy fatigue of the legs and occasional mild cramplike pain, and a third had noted frequent numbness in the lower legs.

Observations on Blood Pressure and Femoral Arterial Pulsations.—The two most important diagnostic features of coarctation of the aorta are the presence of hypertension in the arms in association with a much lower systolic blood pressure in the lower extremities and diminution and retardation of the pulsations in the femoral arteries. The hypertension in the arms may be of a mild degree, especially in children and young adults, and in exceptional instances [2] the brachial blood pressure is within normal limits. The systolic pressure is always lower in the legs than in the upper extremities, and the pulsations in the femoral arteries, if present, are invariably delayed and diminished. The reduction in the femoral pulse and systolic pressure in the legs is the result of the increased resistance offered to the flow of blood by the narrowed aorta and the circuitous anastomotic pathways. The hypertension in the upper extremities probably is due principally to the same cause, although it has been suggested that diminution in renal blood flow also is a responsible factor.[3] Blumgart, Lawrence and Ernstene [4] reported the arteriolar pressure, as measured by the histamine flare method, to be approximately normal in their 2 patients with coarctation. This observation is consistent with the hypothesis that the hypertension in the arms is more directly related to the resistance offered by the stenosed aorta and the collateral pathways than to any mechanism which would manifest itself by increased arteriolar tone.

Although the systolic arterial pressure is always higher in the arms than in the lower extremities in coarctation of the aorta, the diastolic pressure in the legs seldom is reduced correspondingly. As a result, diastolic hypertension in the lower extremities is a frequent occurrence. The elevation in diastolic pressure may be due to diminished amplitude of the pulse wave secondary to the damping effect of the constricted segment of the aorta and the collateral channels, as pointed out by Hull.[5]

[5] Hull, E.: On the Evidence for Generalized Arteriolar Constriction in Coarctation of the Aorta, Am. Heart J. **35:** 980-983 (June) 1948.

In all but 4 of the 24 patients in the present series, the systolic arterial pressure in the arms was 160 mm. of mercury or higher. The lowest systolic brachial blood pressure recorded was 146 mm. of mercury. The diastolic pressure in the arms was 100 mm. or more in 13 patients and less than 90 mm. in 6. In 4 persons there was a significant difference in the pressure in the arms; that in the left arm was lower in each instance. Evidence from necropsies and from observations at the time of operation indicates that such inequalities in the brachial blood pressures usually are the results of involvement of the origin of the left subclavian artery in the area of coarctation. In all patients in the present series the femoral arterial pulsations were diminished or absent, and the systolic blood pressure in the lower extremities, when obtained, was lower than in the arms.

The presence of coarctation of the aorta is often overlooked, but this error can be avoided if the physician palpates the femoral arteries in every patient in whom the brachial blood pressure is elevated or in whom a difference is present in the volume of the radial pulse in the two arms. Therefore, it is recommended that palpation of the femoral arteries be made a routine part of every physical examination.

Evidence of Collateral Circulation.—The collateral channels through which the circulation to the lower portion of the body is maintained in coarctation of the aorta make themselves apparent by roentgenologic evidence of erosion of the costal grooves of the ribs (fig. 1) and frequently also by the presence of visible or palpable pulsating vessels over the back and in the axillas. Similar vessels are observed occasionally over the epigastrium and lower anterior portion of the thorax. These features are of great value in corroborating the diagnosis, but they vary considerably in prominence, depending on the age of the patient and the degree to which the aorta is stenosed. The changes are seldom observed before the early years of adolescence.

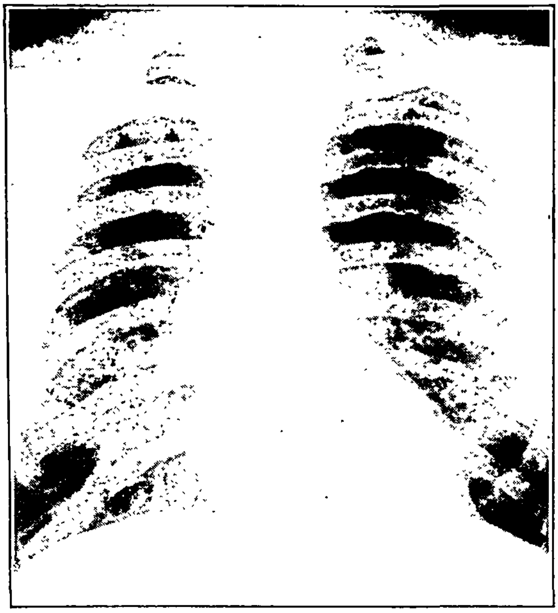

Fig. 1.—Roentgenogram of the thorax illustrating scalloping of the ribs in coarctation of the aorta. The aortic knob is absent, and there is widening of the upper mediastinal shadow to the left, probably due to dilatation of the left subclavian artery.

Visible or palpable vessels were present over the back in 10 of the 24 patients whose symptoms are summarized in this report.

At times in the past, the roentgenologist, by appreciating the significance of the erosion or scalloping of the ribs, has been the first to recognize the presence of coarctation of the aorta. Careful inspection for this feature should be a part of the interpretation of every roentgenogram of the thorax. It should also be emphasized that it is the costal groove, and not the inferior margin of the ribs, which is eroded by the dilated, tortuous intercostal arteries taking part in the collateral circulation (fig. 2).

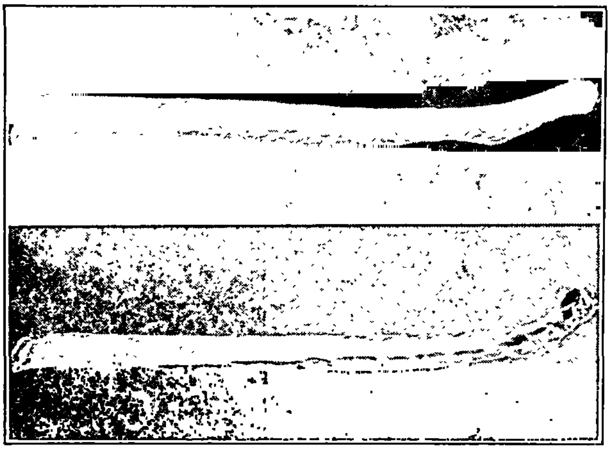

Fig. 2.—Rib from patient with coarctation of the aorta. The scalloping seen in roentgenograms is due to irregular erosion of the costal groove. Upper, roentgenogram; lower, photograph.

Scalloping of the ribs was observed in the roentgenograms of 21 of the 24 patients in the present series. The oldest of the 3 patients in whom the ribs were normal was 13 years of age. The changes, when present, involved one or several ribs from the third to the tenth, inclusive. The second rib was affected in 1 patient, but the first, eleventh and twelfth ribs always appeared normal. The second and eleventh ribs have only a shallow costal groove, and the first and twelfth ribs have none. In 7 patients scalloping was severer on the right side than on the left, and in 3 it was more extensive on the left than on the right.

In many of the patients in whom there was erosion of the ribs, a long, narrow line of distinctly increased density was observed near the inferior margin. In addition to being present in ribs that showed scalloping, the change was also noted at times in ribs that otherwise appeared normal. The reason for the occurrence of this line is not known, but it may possibly be due to eburnation of the bone as a reaction to increased pressure from the dilated, tortuous intercostal arteries. No earlier reference to this feature has been found in the literature.

Roentgenologic Examination of the Heart and Aorta.—Certain other roentgenologic changes are commonly present in coarctation of the aorta, but they do not have the pathognomonic significance possessed by erosion of the costal grooves. The most constant of these are absence or great diminution in the size of the aortic knob in the posteroanterior view (fig. 1) and unusual clearness of the aortic window in the left anterior-oblique position (fig. 3). The heart may or may no be enlarged. The ascending aorta often is dilated, an this change in association with absence of the aortic knob always should suggest the possibility of coarctation. There may be widening of the upper mediastinal shadow to the left due to dilatation of the left subclavian artery.

Of the 24 patients included in this report, cardiac enlargement was present in 13, the ascending aorta was dilated in 8 and the aortic knob was absent or very small in 22.

Cardiac Murmurs.—Auscultation of the heart in patients who have coarctation of the aorta frequently reveals the presence of murmurs. The commonest of these is a systolic murmur over the aortic area. A similar murmur often is easily heard in the interscapular area. A diastolic murmur due to aortic insufficiency is an infrequent finding, and an occasional patient may present a "machinery type" murmur in the left second intercostal space indicative of patency of the ductus arteriosus.

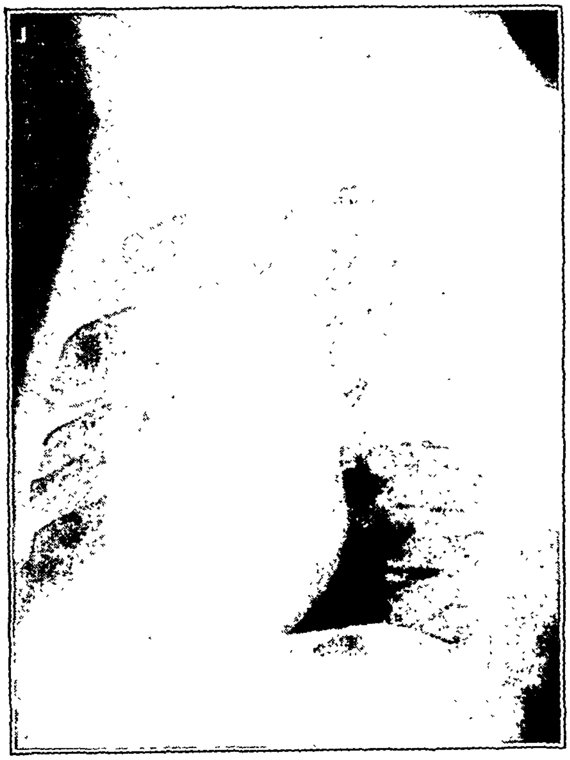

Fig. 3.—Roentgenogram of the thorax. Left anterior-oblique view demonstrating unusual clearness of the aortic window.

A systolic murmur was present over the base of the heart in 21 of the 24 patients in the present series. In 2 of these and in 1 other person there was a diastolic murmur of aortic insufficiency. None presented auscultatory evidence of patent ductus arteriosus. Two patients had no murmurs of any kind.

The Electrocardiogram.—Although the electrocardiogram may be abnormal in patients who have coarctation of the aorta, the changes are of no diagnostic value.

SUMMARY

A series of 24 patients with coarctation of the aorta of the adult type is reviewed.

The development of surgical technics for the correction of this anomaly has made it a matter of practical importance that the presence of the condition be recognized as early in life as possible.

The most constant diagnostic sign of coarctation of the aorta consists of diminished or absent pulsations in the femoral arteries. Hypertension is almost always present in the upper extremities, and the systolic blood pressure is always lower in the legs than in the arms. The radial pulses are at times unequal in the two arms. Visible or palpable pulsating vessels often are present over the back and in the axillas. Roentgenologic examination of the thorax usually reveals evidence of erosion of the costal grooves and a line of increased density near the inferior margin of the ribs. The aortic knob is generally absent or greatly diminished, and the ascending aorta often is dilated. In roentgenograms made in the left anterior-oblique position, the aortic window is unusually clear.

The presence of coarctation of the aorta frequently is overlooked, but this error can be avoided by palpating the femoral arteries in the course of every physical examination and by careful inspection of every roentgenogram of the thorax for the various changes mentioned.

ABSTRACT OF DISCUSSION

Dr. O. T. Clagett, Rochester, Minn.: Now that an effective surgical treatment for some cases of coarctation has been developed, it becomes an important responsibility of all physicians to be alert to the diagnosis of this condition. Coarctation of the aorta is not as rare as it is generally believed to be. A conservative estimate would indicate there are at least 35,000 persons in the United States who have this condition. The diagnosis of coarctation is not difficult. A blood pressure manometer, a stethoscope and a careful physical examination are all that are necessary. It can be confirmed in most patients by the roentgenologic signs noted by Dr. Proudfit. The intraluminal measurement of blood pressure in the radial and femoral arteries and the recording of the pulse waves have proved in our experience a most valuable method of studying coarctation and have provided a means of measuring accurately the changes in circulation and blood pressure that have resulted from operation. This examination is carried out by inserting needles connected to electronic strain gages directly into the radial and femoral arteries and simultaneously recording the pressures and pulse waves in these vessels. We believe this method is an easier, safer and more valuable test than angiocardiography. In my opinion, the operation should usually not be done before 10 years of age, and it may be best delayed until the patient is 15 to 16 years of age and has attained most of his growth. Patients over 20 years of age are not as suitable for operation as younger patients because extensive and permanent cardiovascular damage may have developed. However, we have performed operations with excellent results in patients beyond 30 years of age. We have not felt that age itself is a contraindication. However, operation should not be attempted in patients in whom signs of cardiac failure have developed, in patients in whom aneurysms of the great vessels can be demonstrated or in those who have had cerebrovascular accidents. Patients who have been operated on for coarctation have not been followed for a long enough time to permit an accurate evaluation of the results of operation. The early results in those in whom a satisfactory anastomosis could be accomplished are encouraging, however. The operation for coarctation is a formidable one, not to be undertaken by a surgeon without considerable experience in vascular surgery. The surgical mortality has ranged from 12 to 20 per cent in reported series thus far. However, as Dr. Proudfit pointed out, more than 60 per cent of patients with coarctation die before their fortieth year if not operated on, and, in view of this poor prognosis, the surgical risk is justifiable. Results from operation will improve with more experience and better technic. The greatest opportunity for improvement, however, lies in earlier diagnosis of this condition, so that operation can be performed at an opportune time before extensive cardiovascular damage has resulted. Early diagnosis requires a blood pressure determination as part of every routine physical examination, and a consideration of the possibility of coarctation in every patient who has an elevated blood pressure. Diminished or absent pulsation in the abdominal aorta and femoral vessels in the presence of an elevated blood pressure in the arms indicates coarctation. It is particularly to be urged that these examinations be carried out in children and young adults so that the diagnosis of coarctation can be made before irreparable cardiovascular damage has developed as a result.

Dr. Proudfit: I should like to reemphasize that coarctation in the vast majority of patients can be diagnosed accurately by the simple means which are at hand in ordinary physical examination, although the diagnosis may be established somewhat more securely by pressure records.

THERAPEUTIC POSSIBILITIES OF MICROWAVES

Experimental and Clinical Investigation

In spite of the fact that radar is considered as one of the outstanding developments of World War II, its principles are not new. Radar operates on the principle of sending out extremely short pulses of high frequency energy and measuring the time interval required for this burst of energy to reach its destination and be reflected back to its source. By knowing the length of time required for the energy to travel back and forth, distance to the object can be accurately measured.

The magnetron is essentially a device which can be pulsed rapidly for intervals of the order of microseconds and is capable of delivering hundreds, thousands or millions of watts of power at wavelengths in the centimeter range or shorter. During the war the magnetron and other microwave tubes have been used almost solely for detection and direction applications. For these applications a pulse-echo system is employed. As soon as the war was over, investigation of the therapeutic possibilities and other applications of continuously produced microwaves was inaugurated.

For many years radiations of very high frequency have been used in medicine and surgery for heating tissues. Since 1890, when d'Arsonval[1] demonstrated that high frequency electrical currents of 10,000 cycles per second caused no muscular contractions, but produced heating of tissues when they were passed through the human body, physicians have been employing increasingly higher frequencies for heating living tissues. In this communication we are reporting on the experimental and clinical application of high frequency radiations at a frequency of 2,450 megacycles per second at a wavelength of approximately 12 cm. These microwaves have optical properties and can be reflected, refracted and diffracted. They can be selectively absorbed. The absorption factor of water at 100 F. for microwaves[2] having a frequency of 2,450 megacycles per second is approximately 7,000 times that for radio waves having a frequency of 27 megacycles per second. The latter is that commonly used in the so-called short wave diathermy.

Up to the present time the reports[3] in the literature have been few regarding the effects of microwaves on the living organism. These were conducted by the armed forces to dispel fears of possible ill effects of radar radiations on personnel connected with radar work. The reports are concerned only with exposure to radar pulses, which are brief, rapid bursts of energy, and not with exposure to continuous microwave energy. Follis[3b] showed that very short bursts of energy at the high frequencies used in connection with radar work had no ill effects on guinea pigs. The biologic effects of microwaves are under investigation. Up to the present the general impression has been that if the output of microwaves is properly controlled and directed no ill effects will result.

EQUIPMENT USED

The equipment which was used in our studies consisted of a small portable microwave diathermy machine containing an air-cooled magnetron tube. The energy is transported by a coaxial cable from the generator to the director. The energy is radiated onto the body from the director. There are several types and sizes of directors. The one used in this study was a small hemispherical director, the diameter of which was 3½ inches (9 cm.).

In preparation for using the microwave machine, the filament current is first turned on; then, after a time delay, the plate current is turned on. The plate current is controlled by a variac® and is read on the meter in milliamperes or in percentage output. The output in watts has been calculated for these machines. In our studies variable outputs at different distances for various durations were used in order to determine effective and safe dosage and distance and repeatable procedures. The measurement of local temperatures of the tissues was made by the use of thermocouples before, and after, exposure to microwave radiations. Up to date, it has not been possible to measure the temperature reliably during exposure to microwaves. The hemispherical director used in this study does not have a uniform pattern of heating. Greater heating is produced toward the periphery than in the central area of exposure. Our measurements were confined to the area where heating is considered maximal; that is, near the periphery of the director. The studies were made in the extremities, where good muscles and relatively even surfaces are available.

Carefully applied technic produces repeatable results. This can be done by marking the exact spots where thermocouple needles were inserted. The depth is controlled by marking the shaft of the thermocouple needles so that they can be inserted to the desired level. The temperatures were taken in the same area of the heating pattern. After a satisfactory control period, the thermocouples were removed and the microwaves were turned on, with special care as to accurate spacing of the director and exact output. At the

termination of the heating period the thermocouples were reinserted in the same area and the first readings were taken after the thermocouples had time to come into equilibrium. This usually occurred within one minute after discontinuation of the heating with microwaves. The galvanometer deflections were either read on a calibrated scale or photographed. The cutaneous temperature was taken by means of contact thermocouples and in some cases by thermistors. The subcutaneous and muscle temperatures were recorded by needle thermocouples inserted into the specified region.

STUDIES ON ANIMALS

In collaboration with Leden [4] we demonstrated without doubt that microwaves can heat tissues. In fact, by the use of sufficient output, temperatures can be raised to a fairly high level. With a 75 milliampere plate current and the director at a distance of 5 cm., the rise in cutaneous temperature was usually between 3 and 5 C. after twenty minutes. In several experiments the rise of muscle temperature was greater than that of the skin. It must be kept in mind that the control temperatures of the deeper tissues are higher than that of the skin, so that even with similar rises in all tissue layers the final temperature of the muscle at a depth of 1.5 cm. is greater than that of the subcutaneous tissue or the skin. (This is not true for deeper layers of muscle.)

Table 1.—*The Influence of Exposure of the Thigh to Microwaves* on the Flow of Blood in the Femoral Vein*

8	20	55	175
9	21	45	114
Average			109

* Plate current 75 milliamperes; hemispherical director (9 cm. diameter) at a distance of 5 cm. from skin.

The rate of cooling of the various tissues was carefully followed and yielded interesting results. In all cases the skin and superficial tissues cooled more rapidly than deeper ones. In the trained animals cooling was complete and rapid. Within thirty minutes after the microwave machine had been turned off, the temperatures returned to control values. In the anesthetized animals on which surgical procedures were performed the cooling was much slower.

The blood flow studies were made on the animals by the use of a bubble flowmeter which was a modification of Dumke and Schmidt's.[5] Continuity between the cannulas, introduced into the proximal and distal ends of the sectioned vessel, and the flowmeter was established by short rubber tubing. The flowmeter was calibrated so that a record of the time necessary for the bubble to flow from marker to marker measured the rate of blood flow. Definite increase in blood flow occurred as a result of heating produced by exposure to microwaves. Table 1 gives the data on the individual experiments on blood flow. It shows that an average increase of 109 per cent in blood flow through the femoral vein resulted from heating the thigh with microwaves.

After we had found, in collaboration with Leden, that exposure of normal trained or anesthetized dogs to microwaves produced an increase in the blood flow in the exposed extremity accompanying an increase in cutaneous, subcutaneous and muscle temperatures, we tried to determine the effects of microwaves on ischemic tissues in anesthetized dogs. In collaboration with Worden,[6] we sought experimental evidence to help answer the question: Does ischemia of tissues contraindicate irradiation with microwaves? Ischemia of the lower extremities was produced in the anesthetized dog by a clamp placed over the abdominal aorta close to its bifurcation into the common iliac arteries. From this study we learned that when ischemic tissue was irradiated for durations of five and ten minutes there was no difference in heating effects as compared with normal tissues. However, after fifteen or twenty minutes of irradiation, serious damage to the ischemic tissues occurred even though the rises of temperature were not appreciably higher than those of normal tissues. It was also observed that in practically every experiment when the duration of irradiation was fifteen or twenty minutes burning of the ischemic tissues took place. When such burns occurred, they appeared over bony prominences first. Because of the fact that microwaves are efficiently absorbed by water, it was repeatedly observed that whenever blebs or pockets of fluid occurred in the area exposed to microwaves their temperature was much more elevated than that of the rest of the heated tissues. Microwaves heat edematous tissues much more than normal tissues. The data obtained from these experiments justified the conclusions (1) that by placing the hemispherical director 2.5 cm. from the skin and using a power output of 30 watts, the elevations in temperature were highest after twenty minutes of irradiation, and (2) that ischemic tissues, bony prominences and areas of localized accumulation of fluid should be irradiated with caution.

STUDIES ON HUMAN SUBJECTS

Having been convinced that definite heating of tissues in trained and in anesthetized laboratory animals could be easily produced by exposure of various regions of the body to microwaves, we undertook cautiously the investigation of the effect of microwaves on man.

In collaboration with Gersten,[7] we determined the effect of various outputs of microwaves and of different periods of exposure to microwave diathermy, on the peripheral circulation and on the temperature of tissues in the exposed area. We were especially interested in determining the optimal effects on the peripheral circulation and on the temperatures of the irradiated areas in man.

About three hundred observations were made on more than 50 normal human subjects. The duration of exposure to microwaves varied from five to thirty minutes, and the output was 80 or 60 watts. The study included the blood flow and the cutaneous, subcutaneous and muscle temperatures of the area exposed to microwaves. The studies of blood flow were made on the heated and on the contralateral extremity by the use of the venous occlusion plethysmograph [8] with a compensating spirometer recorder. In the experiments in which the blood flow was studied the cutaneous temperatures of both the heated and the contralateral extremity were taken by means of a thermistor. The studies on tissue temperature of the exposed extremity were made by means of copper-constantan thermocouples. The cutaneous thermocouple was slightly weighted and placed in contact with the skin. The subcutaneous thermocouple was 1.9 cm. long and was inserted so that the entire shaft lay beneath the skin with its recording tip close to the shaft of the muscle thermocouple. The muscle thermocouple was inserted vertically to a depth of 1.5 cm.

The source of the high frequency radiations to which the forearm was exposed was similar to the air-cooled multicavity magnetron that was used in the studies on animals. The distance of the hemispherical director from the area of the exposed skin was 5 cm. in all the observations.

Control readings of peripheral blood flow or temperatures or both were established after the subject had been lying quietly on the test bed for at least half an hour in a room the temperature of which did not vary during the observations. The microwaves were applied to the volar surface of the forearm with the proximal margin of the hemispherical director approximately 8 cm. from the elbow. The blood flow readings were again taken five minutes after the end of the period of treatment with microwaves. In some studies additional determinations of blood flow were taken ten minutes after exposure to microwaves.

* Blood flow readings in this group of studies were taken on an average of 6.8 minutes after cessation of heating.

The cutaneous temperatures in the subjects on whom studies of blood flow were made were taken on the exposed extremity immediately after treatment with microwaves and again after one minute. The cutaneous temperature of the unexposed extremity was taken one minute after the microwaves were turned off. The temperature studies after the exposure to microwaves were taken one minute after the period of heating by means of thermocouples. Additional temperature readings were taken every minute for five minutes, and in a few experiments the temperature determinations were continued for forty minutes with readings taken at five minute intervals. In a number of observations, oral temperatures and heart rate were determined before and after exposure to microwaves.

The data on blood flow are given in table 2. In each group of studies the average blood flow in cubic centimeters per minute per hundred cubic centimeters of tissue in the heated forearm is given and the average percentage increase in blood flow is shown. When the output of the microwave machine was set at 80 watts and the distance of the director was fixed at 5 cm. from the heated area of the forearm, the average percentage increase in blood flow as a result of heating was greater with longer durations of exposure to microwaves; namely, after five minutes of heating the blood flow increased 8 per cent, after ten minutes it increased 13 per cent, after fifteen minutes 21 per cent, after twenty minutes 48 per cent and after thirty minutes 65 per cent.

TABLE 3.—*Effect of Microwaves on the Blood Flow in the Unheated Extremity*

Number of Studies	Duration of Heating, Minutes	Dosage, Watts	Flow Before Heating, Cc. per 100 Cc.	Flow After Heating, Cc. per 100 Cc.	Percentage Change
20	5	80	9.87	9.65	— 2
20	10	80	9.10	8.60	— 5
9	15	80	7.76	6.96	—10
20	20	80	7.60	8.00	5
26*	20	80	8.20	7.30	—11
10	30	80	7.24	7.79	8
10	15	60	8.05	8.29	3
12	20	60	7.06	6.05	—14
12	30	60	6.79	7.03	4

* Blood flow readings in this group of studies were taken on an average of 6.8 minutes after cessation of heating.

We found that exposure of the forearm of normal human beings to microwaves at an output of 80 watts produced a sigmoid (S-like) relation between increase in blood flow and the duration of irradiation. After fifteen minutes of heating the increase in blood flow was approximately the same for 60 and 80 watt outputs. With longer periods of heating the 80 watt output produced significantly greater increases in blood flow than the 60 watt output.

Table 3 gives the corresponding data on the blood flow in the unheated contralateral extremity. It is clearly shown that the changes in blood flow in the unheated extremity are variable and insignificant.

Table 4 gives the temperature rises in degrees centigrade of the skin, subcutaneous tissues and muscles, as a result of exposure of the forearm to microwaves for the given duration and output. The elevation of the temperature of the skin, subcutaneous tissues and muscles in the area exposed to microwaves was significant, even when the duration of exposure was only five minutes. For the various durations of exposure to microwaves, the average rise in temperature was greatest in the muscles.

TABLE 4.—*Effect of Microwaves on Temperature of Skin, Subcutaneous Tissue and Muscle*

Number of Studies	Duration of Heating, Minutes	Dosage, Watts	Rise in Temperature (C.) After Heating		
			Skin	Subcutaneous	Muscle
26	5	80	4.5	5.2	5.5
25	10	80	4.8	5.7	6.1
10	15	80	4.8	5.5	6.7
25	20	80	4.7	5.8	6.7
10	30	80	2.9	3.4	4.3
10	15	60	4.1	4.8	6.2
10	20	60	5.0	5.4	6.6
10	30	60	3.7	4.0	5.4

A significant finding was noted in this study. A progressive increase in tissue temperature occurred when the periods of exposure to microwaves were increased from five to fifteen minutes. Between fifteen and twenty minute periods of exposure there was no difference in the rises in tissue temperature. However, when the period of exposure to microwaves was prolonged to thirty minutes, the rise in temperature of the skin, subcutaneous tissues and muscle was significantly less than for the fifteen to twenty minute exposures.

There was no change in oral temperature or in heart rate, and no ill effects from exposure to microwaves at an output up to 80 watts and for periods up to thirty minutes.

CLINICAL APPLICATION OF MICROWAVES

Our clinical experience with microwave energy as a source of therapeutic heat is still limited. Up to date 70 patients have received a total of approximately 670 microwave applications. The average number of treatments per patient is 9. Maximal duration of one treatment was thirty minutes. The majority of patients have had acute subdeltoid or subacromial bursitis or chronic periarthritis of the shoulder with varying degrees of pain and limitation of motion. Eight patients have had microwaves applied for the following conditions: 4 for acute myositis, 2 for olecranon bursitis, 1 for arthritis of the temporomandibular joint and 1 for osteoarthritis of the knee. Seven patients with involvement of the shoulder received roentgen therapy previous to or simultaneously with the application of microwaves. In several cases of acute or subacute bursitis, marked relief of pain followed the application of microwaves. Two patients with painful stiff shoulders that had been resistant to previous intensive roentgen therapy, diathermy, massage and exercise, began to show rapid improvement after a shift to applications of microwave radiations. In 4 of the 70 cases the pain was increased by the application of microwave radiation.

Five patients were treated postoperatively after dental extractions, for residual pain and swelling present two to twelve days after operation. One to four treatments of five to ten minutes each were given. Results were excellent, both objectively and subjectively, in all these patients. The swelling subsided early, and full movement of the jaw could be made sooner than usual.

Although the majority of these patients showed fair to excellent subjective and objective improvement, our number of observations is so limited that it is impossible as yet to draw definite conclusions regarding the clinical effectiveness of microwave radiation. However, so far no untoward effects have been noted in any of the cases in which microwaves were used in treatment.

COMMENT

In any discussion of microwaves certain questions arise that should be answered before final conclusions can be drawn: 1. What possible changes other than heating may result from exposure to microwaves? 2. How high may the temperatures of the deep tissues be raised without causing damage to the superficial tissues? 3. Can deep tissues be damaged by microwave heating without the physician's or patient's being aware of destructive action? 4. Is there selective absorption of microwave radiations with resultant differences in heating of various tissues such as bone, the eyes, teeth, moist skin, dry skin, nerve trunks, edematous tissues, hematomas or abscesses? 5. What will be the result of applying microwaves over tissue containing metallic or other foreign objects?

CONCLUSIONS

Microwaves are apparently a safe, convenient and comfortable form of heating for local application to tissues. In both dogs and normal human beings microwave radiations will increase the circulation through the irradiated area. Microwave directors are not as yet available for heating very large areas of the body.

Microwaves may be contraindicated or at least should be used with caution over tissues with impaired circulation, over tissues with high fluid content, over regions containing metallic implants and over areas with hemorrhagic tendencies.

Much more careful investigative work must be done with microwave energy before we shall be certain of its rightful place in the field of physical medicine. Although our investigations to date indicate that microwaves have considerable promise, clinically they should be used with caution and reservations.

ABSTRACT OF DISCUSSION

Dr. Harold Dinken, Denver: Dr. Wakim, would you care to make comment on the comparative efficiency of short wave induction and microwaves as far as for deep heating of the periosteum? As for the work with thermocouples, it would indicate that you could heat to 160 F. Can you get that high with microwaves?

Dr. K. G. Wakim, Rochester, Minn.: Our investigations so far on that phase—i. e., comparative efficiency of short waves and microwaves—are not sufficient to qualify me to give a definite answer to your question.

Dr. Dinken: In the presence of foreign bodies of a metallike nature, is there any effect from the microwaves differing from that of the short wave?

Dr. Wakim: In the presence of metallic foreign bodies in the field of irradiation with microwaves, there is the possibility that the metal may act as antenna and concentrate microwave energy. I would not be surprised if burns result in such areas of concentrated heat energy.

Dr. Jerome Weiss, Brooklyn: What distances and power outputs are they using in the initial clinical studies?

Dr. Wakim: A distance of 5 cm. and a power output of about 60 watts were used in our initial clinical studies. The problem of varying distance and output are under investigation, and as soon as we have sufficient data to convince ourselves of optimal distance and output we will state that. We must accumulate much more data before we can make any definite suggestions.

Dr. Weiss: Are you using the subjective sensation of warmth as the end point or guide to your dosage?

Dr. Wakim: On the patients, yes. We used the same distance and output on ourselves first. Sometimes, I felt much warmer in the beginning than toward the end of a period of exposure. I do not believe that subjective sensations are very reliable. We are looking for objective methods. The use of thermocouples and temperature registration is far superior to subjective sensations, but unfortunately cannot be applied during exposure to microwaves.

Dr. Louis B. Newman, Chicago: Dr. Wakim, you have shown that the temperature of the tissues drops after twenty or thirty minutes, and it seems to continue to drop. What happens after thirty minutes? Is there a still further drop or is there a leveling off in the temperature?

Dr. Wakim: We have not studied that, but I do not believe that there would be much of a dropping in temperature any more because we have not so far been able to increase the circulation above the 80 per cent I stated. After we are sure that microwaves have no other biologic effect than heating, then we will go to long durations and find out what happens to the temperature levels. This is a new device, and it pays to be cautious and conservative in its application and appraisal. I would like to keep my statements within the bounds of our data to date.

Dr. David Kling, Los Angeles: You mentioned treatment of bursitis. In most cases of bursitis there is an effusion. Would you advise physicians who own this apparatus not to use it in bursitis unless they aspirate the fluid first? Would you consider the treatment contraindicated in rheumatoid arthritis with effusions in the joints?

DR. WAKIM: We are not yet ready to give definite opinions on indications and contraindications. The number of patients we treated is small. After we have treated several hundred patients and appraised our findings we might be in a better position to give more definitely the indications and contraindications for microwave diathermy. However, the presence of bony prominences and localized accumulations of fluid should be handled with due care.

DR. LEE: Would you give the difference in pathologic findings of a burn from a microwave as compared to a burn from another source? Is there any difference pathologically under the microscope of the tissues?

DR. WAKIM: I am not qualified to answer that, as I have not studied the difference between burns caused by microwaves and those caused by other means. Dr. Weiss, who made such studies, may be able to tell us.

DR. EMILE BRUNOR, New York: I would like to know whether the presence of the thermocouple will cause a difference in the temperature locally.

DR. WAKIM: No, the mere transient presence of the needle thermocouple in tissues does not cause any difference in the local temperature. The thermocouples were not left in the tissues during exposure to microwaves.

IDIOPATHIC THROMBOCYTOPENIC PURPURA AND MENORRHAGIA MISTAKENLY TREATED FOR LOCAL DISEASE

Report of Four Cases

WILLIAM DAMESHEK, M.D.
and
JACK J. RHEINGOLD, M.D.
Boston

That profuse and prolonged bleeding from the uterus may occur in idiopathic thrombocytopenic purpura has long been known. Indeed, menorrhagia may be the earliest manifestation of the disease and on occasion its only symptom. However, excessive menstrual bleeding is all too often considered as being due to purely local causes, with the result that such procedures as dilation and curettage of the cervix and even hysterectomy have been performed. The observation of 4 such cases in the period of a few months, the underlying disease in each instance being idiopathic thrombocytopenic purpura, brought this situation acutely to mind. In 3 of the 4 cases studied, dilation and curettage of the uterus had been performed at least once, and in the fourth case hysterectomy had been done. The simple procedure of studying a blood smear for blood platelets would have revealed the almost complete lack of these cellular elements and thus have prevented the various gynecologic procedures.

REPORT OF CASES

CASE 1.—N. G. W., a 52 year old married woman novelist, was admitted to the Joseph H. Pratt Diagnostic Hospital with the chief complaint of easy bruising, bleeding from the gums and menorrhagia for a period of about four months. Early in the present illness she had noted "bruises" on the legs and arms, apparently unrelated to trauma. Her gums bled easily when she brushed her teeth. Her menses began to increase in duration and quantity of flow and about two months before admission became particularly prolonged. She was informed that she had fibroids of the uterus, requiring immediate hospitalization for operation. In the hospital she was found to be anemic (red blood cell count 2,700,000 and hemoglobin 48 per cent) and was given several transfusions. Despite this, her red cell count fell to 1,700,000 and on one occasion symptoms of shock developed, for which transfusions of plasma and 1,000 cc. of blood were given. Hysterectomy was performed as an emergency measure, and, although the patient improved considerably, there was continued oozing from the vagina and the gums began to bleed spontaneously. Eight transfusions of blood were given without any effect on the bleeding tendency. Shortly thereafter, petechiae were noted on both legs. The possibility of a hemorrhagic disorder was considered, and the patient was referred for diagnosis and further treatment.

There was no family history of a hemorrhagic tendency or any other blood dyscrasia. Five years previously, the patient experienced painful swelling of several joints, including those of the knees, the feet and the fingers, in association with a rash on the bridge of the nose and cheeks. The diagnosis of lupus erythematosus was made, and treatment with weekly injections of gold compound was instituted. However, a cutaneous reaction occurred about three months later, following which treatment with the gold preparation was discontinued. The patient's symptoms disappeared gradually, leaving a slight residual deformity of the hands and wrists.

Physical examination on admission revealed a pale slight asthenic middle-aged woman. The gums were boggy, with evidences of slight bleeding. Many small petechial hemorrhages of the buccal mucosae and palate were present. There was no lymphadenopathy. The liver and spleen were not palpable. There was a healing midline scar of the lower part of the abdomen. Numerous pinpoint petechial hemorrhages and several ecchymoses were present on the lower legs. The fingers of both hands showed spindle-shaped deformities, and the right elbow could not be fully extended.

Blood cell counts revealed red blood cells 3,400,000, hemoglobin 10.0 Gm. (65 per cent) and white blood cells 3,800, with 53 per cent polymorphonuclear leukocytes, 17 per cent lymphocytes, 20 per cent monocytes, 9 per cent eosinophils and 1 per cent basophils. The blood smear showed a complete lack of platelets. A platelet count revealed 13,600 platelets per cubic millimeter (normal count about 500,000 per cubic millimeter), representing for practical purposes essentially no platelets. A sternal puncture revealed a hyperplastic marrow with increased numbers of megakaryocytes, which, however, showed no evidence of platelet production. The result of the tourniquet test was decidedly positive and the bleeding time considerably prolonged. Bleeding was stopped manually at the end of ten minutes. The coagulation time was within normal limits, but there was no clot retraction. The diagnosis of idiopathic thrombocytopenic purpura was made. Following two transfusions, splenectomy was performed. An accessory spleen was found and removed. Postoperatively the patient did well clinically, although a stitch abscess developed. There was a complete cessation of vaginal and gingival bleeding, and no further petechiae or ecchymoses occurred. However, the rise in platelet count was relatively unsatisfactory, never reaching levels above 100,000 per cubic millimeter. At the time of the patient's discharge from the hospital the following blood cell counts were obtained: red blood cells 3,480,000, hemoglobin 11 Gm. (71 per cent), white blood cells 6,200 and platelets 86,240. The bleeding time remained somewhat increased. In the course of the next year, the platelet count rose gradually to almost normal levels. The red cell counts and hemoglobin levels were, however, well maintained.

Comment.—In this case, in which there was severe menstrual bleeding requiring numerous transfusions, hysterectomy was performed on the mistaken assumption that uterine fibroids were the cause of the bleeding. When vaginal bleeding continued after hysterectomy, a hemorrhagic disease was suspected and idiopathic thrombocytopenic purpura found. There was an incomplete result from splenectomy, indicating that a splenic

---

From the Ziskind Laboratories of the Pratt Diagnostic and New England Centre Hospitals and the Department of Medicine, Tufts College Medical School.

abnormality was probably not the only causative factor in the patient's thrombocytopenic purpura. Other factors might include lupus erythematosus (which itself may result in thrombocytopenia), treatment with gold compound and rheumatoid arthritis. It should be noted that, despite the initial relative lack of platelet response, there was complete cessation of bleeding from mucous membranes and into the skin, indicating probably that splenectomy had at first resulted in a vascular rather than a thrombocytopenic effect.

Case 2.—M. E. W., a 20 year old single white girl, was admitted to the Joseph H. Pratt Diagnostic Hospital with the chief complaint of bleeding profusely from the vagina, rectum and gums. The present illness began about thirty-two months before admission, when she consulted a dentist for bleeding of the gums; local therapy was given for about a year. About a year and a half before admission she began to work in an industrial plant where she came in contact with cyanate solution. Six months before admission small spontaneously appearing ecchymoses had been noted. About three months before admission and following a severe fall she noticed extensive ecchymoses of the upper and lower extremities. Several days later she experienced nausea and vomiting and on the following day noticed red blood in the feces. On the following day her expected menstrual period began and was exceedingly profuse and persistent. After several weeks of bleeding she was admitted to her local hospital where dilation and curettage were performed and a vaginal pack inserted. Several transfusions were given and when she left the hospital after eleven days the bleeding had ceased. However vaginal bleeding resumed again and became profuse. The patient was readmitted to her local hospital and given a transfusion and again dilation and curettage were performed and a vaginal pack inserted. The bleeding recurred, however, and the patient was referred for diagnosis and therapy.

The past history was not remarkable, and there was no family history of bleeding tendency or blood dyscrasia.

The physical examination revealed a well developed and well nourished young woman. No petechiae or ecchymoses were present. There was no evidence of bleeding from the mucous membranes. The spleen was palpable 2 to 3 fingerbreadths below the costal margin and slightly tender. The liver was palpable 1 fingerbreadth below the right costal margin.

Laboratory examination revealed: red blood cell count 4,300,000, hemoglobin 83 per cent and white blood cells 8,620, with polymorphonuclear cells 40 per cent, lymphocytes 30 per cent, monocytes 10 per cent, eosinophils 5 per cent and basophils 5 per cent. The blood smear showed only rare platelets, which were large and bizarre in shape. The platelet count was practically nil: 8,620 per cubic centimeter. The bleeding time on successive occasions was 7 minutes and 10 minutes. The result of the tourniquet test was positive. Clot retraction was completely lacking at 24 hours. The results of coagulation tests were 17, 21 and 24 minutes. Examination of the marrow by sternal puncture revealed an unusual abundance of megakaryocytes, which were, however, unproductive of platelets.

The diagnosis of idiopathic thrombocytopenic purpura was made, and splenectomy was performed. The splenomegaly was found to be due to congestion with blood, presumably from the repeated transfusions. The platelet count began to rise immediately after operation and soon reached normal levels. Recovery was uneventful, and no further hemorrhagic manifestations occurred. At the time of discharge from the hospital the following blood cell counts were obtained: red blood cells 4,500,000, hemoglobin 13.3 Gm. (86 per cent), white blood cells 8,050, and platelets 1,443,200 per cubic millimeter.

Comment.—In this case numerous transfusions and two curettages of the uterus were performed in a virgin young woman in the attempt to control menorrhagia, the fundamental disease of idiopathic thrombocytopenic purpura not being recognized. Continued hemorrhage finally led to the thought that a hemorrhagic disease might be present. Splenectomy resulted in complete cure.

Case 3.—K. G., a 15 year old girl, was admitted to the Joseph H. Pratt Diagnostic Hospital on Dec. 10, 1947, complaining of excessive menstrual flow. The illness began with the onset of the menstrual cycle about thirteen months prior to admission, when she had a prolonged and profuse menstrual period. She was given antuitrin® (a soluble extract from the anterior lobe of the pituitary), following which the period ceased. The next several periods were essentially normal, but again a prolonged and severe period took place, following which the patient was hospitalized and dilation and curettage performed. Again antuitrin® was given, and again the bleeding diminished. For the next nine months, the periods were not remarkable. However, two months before the patient's admission profuse menstrual flow took place again, continuing for the next five weeks. At this time there was no response to the administration of either antuitrin® or testosterone. The patient was admitted to another hospital, where she was reported to have a red cell count of about 1,800,000 and a hemoglobin concentration of 17 per cent. The leukocyte count was 23,000, with an increased number of polymorphonuclear cells. In addition, myeloblasts and myelocytes were reported as being present in the smear. Because of the possibility of leukemia, roentgen therapy was given over the spleen. Other bleeding phenomena included occasional severe nosebleeds and one episode of bloody vomitus lasting for four to five days. The past history and family history were noncontributory.

Physical examination revealed an adolescent girl with decided pallor. Several small glands were present in the posterior cervical, right axillary and inguinal regions. A grade II systolic murmur was present at the apex and over the entire precordium. The spleen was palpable 4 cm. below the left costal margin.

Laboratory examination revealed: red blood cell count 1,650,000, hemoglobin 32 per cent, and white blood cells 4,000, with 70 per cent polymorphonuclear cells, 15 per cent lymphocytes, 12 per cent monocytes and 3 per cent eosinophils. The reticulocytes numbered 12.5 per cent. The platelet count was 33,000 per cubic millimeter. The blood smears showed only occasional platelets. In addition, the red cells were decidedly abnormal, showing well defined spherocytosis and increased polychromatophilia. The sternal puncture showed a hyperplastic marrow and abundant megakaryocytes which were not producing platelets.

The diagnosis of idiopathic thrombocytopenic purpura in association with hemolytic anemia and granulocytopenia (splenic pancytopenia) was made. It was believed that the entire blood picture could be explained on the basis of hypersplenism.[1] Splenectomy was performed and was followed by a quick rise in platelets and a rapid improvement in the patient's clinical condition. The blood cell counts on discharge were as follows: red blood cells 3,200,000, hemoglobin 8.3 Gm. (53 per cent), platelets 1,216,000 and white blood cells 11,050. Spherocytosis was still present.

Comment.—In this case, menorrhagia was at first considered to be due to a "functional" or endocrine disturbance, for which various endocrine products were given. Later a local lesion was suspected and curettage was performed, although the patient was a 15 year old virgin girl. Studies revealed that the case was of unusual interest, in that not only was idiopathic thrombocytopenic purpura present but there was hemolytic anemia with spherocytosis and a tendency to leukopenia. It is probable that the underlying disease here was familial spherocytosis and that the splenic abnormality led not only to anemia but to thrombocytopenia and granulocytopenia as well (splenic pancytopenia[1]). Cure of all the hematologic abnormalities except the spherocytosis was affected by splenectomy.

---

[1] Dameshek and Estren: Spleen and Hypersplenism, New York, Grune & Stratton, 1948.

CASE 4.—R. McC., an 18 year old single girl, was admitted to the Joseph H. Pratt Diagnostic Hospital with the chief complaint of menorrhagia and metrorrhagia of several months' duration. Since the onset of her menses at the age of 11, she had noticed a tendency to bruise easily. About six months previously, her menstrual period had lasted four to five days longer than usual and the flow was much more profuse. The next three periods were entirely normal. Two months before admission she again had a profuse menstrual flow. The patient was admitted to another hospital and given several transfusions, following which the flow stopped gradually. One month before admission the menstrual period was again unusually prolonged. She was at first treated with hormone injections, but since bleeding continued, dilation and curettage of the uterus were done. Slight bleeding continued intermittently, however, and the possibility of a hemorrhagic disease was suspected. Severe nosebleeds had occurred, and the patient had noticed several ecchymoses on her legs. The past history was of interest because of "anemia" since childhood, when she had had an attack of rheumatic fever. A maternal aunt had suffered from nosebleeds and menorrhagia.

Physical examination revealed an essentially normal-appearing girl. A grade II systolic murmur was heard best at the fourth interspace adjacent to the sternum on the left. Several fading ecchymotic areas were present on the legs. No petechiae of the skin or mucous membranes were seen. Neither the spleen nor the liver was palpable, and there was no enlargement of peripheral lymph nodes.

Examination of the blood revealed: red blood cells 4,000,000, hemoglobin 78 per cent (12.1 Gm.) and white blood cells 7,050, with polymorphonuclear cells 85 per cent, lymphocytes 11 per cent, monocytes 2 per cent and eosinophils and basophils 1 per cent each. Examination of the blood smear revealed a great diminution of platelets, and platelet counts on two occasions were 64,000 and 38,000 per cubic millimeter. The bleeding time was at least 10 minutes (bleeding stopped manually). The result of the tourniquet test was negative. The results of coagulation tests (test tube method) were 17, 22 and 25 minutes. Sternal puncture aspiration revealed a hyperplastic bone marrow containing numerous megakaryocytes; however, these showed little platelet formation. Splenectomy was performed and was followed by a rapid rise in platelet levels to high normal values, and all evidence of increased bleeding ceased. At the time of discharge from the hospital, the following blood cell counts were obtained: red blood cells 4,120,000, hemoglobin 11.3 Gm. (73 per cent), white blood cells 9,300 and platelets 1,212,800.

Comment.—In this case of a virgin girl, menorrhagia was first treated with hormones, and then dilation and curettage of the uterus were performed. Continued bleeding led to the suspicion that a hemorrhagic disease might be present. Splenectomy was curative of the fundamental disorder.

GENERAL COMMENT

Idiopathic thrombocytopenic purpura is a disease of unknown causation, occurring far more frequently in female than in male subjects and characterized by an increased tendency to bleed from the mucous membranes and into the skin. The bleeding tendency is associated with a decided diminution in the circulating blood platelets, which in cases of severe disease almost entirely disappear from the blood. Despite the paucity of blood platelets, their precursors in the bone marrow —the megakaryocytes—are present in increased numbers but show a diminution in platelet production from their cytoplasm.[2] After splenectomy, platelet production by the megakaryocytes becomes considerably increased and is reflected in the blood by a great increase in circulating blood platelets. These usually reach abnormally high levels within a few days or a week after operation, gradually becoming leveled off in about two to three weeks. Splenectomy is not uniformly successful in bringing about a return to normal platelet levels, but in our series of cases the operation has resulted in an immediate and complete response in approximately 60 per cent of the cases, a partial or very slow response in 30 per cent and complete failure in 10 per cent.

One of the first indications of the disease in girls is often the presence of decided menorrhagia. This may occur at the menarche; Werlhof, who gave the first definite description of the disease (cited by Dameshek and Miller[2]), reported such a case. The menstrual bleeding may be associated with such other hemorrhagic manifestations as nosebleeds, bleeding from the gums and other mucous membranes, ecchymoses and petechiae. In some cases, however, menorrhagia may be the sole manifestation of the abnormal bleeding tendency.

It is in these cases, or when the menorrhagia is outstanding, that attention may become focused either on a possible local lesion causing bleeding or on the possibility of an endocrine disturbance.

In these circumstances, local therapy, diagnostic procedures, such as dilation and curettage, and even hysterectomy are not infrequently performed. In addition, various forms of endocrine therapy are often given on the empiric possibility that an abnormality of ovarian or other function may be present. This was the situation in each of the 4 cases reported.

These patients had been examined in various parts of New England, and in each instance the erroneous diagnosis of local lesion causing menorrhagia or of an endocrine disturbance had been made. As a result, various operative procedures, usually dilation and curettage, were undertaken before the diagnosis of a possible hemorrhagic disturbance was first suspected. The procedures of dilation and curettage in 3 of the 4 cases was carried out in virgin girls, 1 of whom was curetted twice. Hysterectomy was performed in 1 case in a woman beyond the childbearing age.

The management of these cases indicates a failure to consider the possibility of hemorrhagic disease in the presence of profuse menstrual flow. That this possibility is important to rule in or out in a given case of menorrhagia and/or metrorrhagia, is self evident from the material presented here. How then can the diagnosis of hemorrhagic disease, more particularly of idiopathic thrombocytopenic purpura, be made quickly or ruled out, so that unnecessary operative procedures in the hemorrhagic cases may be avoided?

Probably the simplest, and in some ways the best, method for determining whether a given case of menorrhagia is due to a reduced platelet count is by the careful examination of a stained blood smear preparation. This is often of greater value and importance than a platelet count, which if performed only occasionally, as in many small laboratories, is often far from accurate. To be sure, the blood smear examination for platelets does not give a figure, but neither does it give an inaccurate figure. If the blood smears are well spread, preferably on carefully cleaned cover slips, and well stained, the platelets should be regularly distributed and their numbers readily estimated. Normally, platelets are present both singly and in clumps in every oil immersion field. With a moderate reduction in platelets, clumps are rarely seen and 3 to 6 single platelets may be found in an oil immersion field. With a decided platelet reduction, only an occasional platelet, at most 2, is seen and many fields are completely lacking in these cells.

---

[2] Dameshek, W., and Miller, E. B.: The Megakaryocytes in Idiopathic Purpura: A Form of Hypersplenism, Blood. 1: 27, 1946.

Usually in idiopathic thrombocytopenic purpura there is not only a quantitative abnormality in platelets but these bodies show more or less striking qualitative changes. They tend to be large, sometimes as large as red cells, and often have bizarre shapes (oval, elongated, round, etc.).

The blood smear is also important from the point of view of examination of the other two blood elements, the leukocytes and the red cells. Primitive leukocytes when present usually signify leukemia, which is almost always associated with decided thrombocytopenia. Red cell changes of importance relate to the presence or absence of nucleated red cells, spherocytosis and increased polychromatophilia.

Confirmation of a low blood platelet level, as estimated from the blood smear, is obtained by the use of several laboratory tests, including the platelet count, the bleeding time, the tourniquet test and the clot retraction test. The platelet count is determined in our laboratory by the indirect method of Dameshek.[3] With this method, simultaneous counts of the reticulocytes can be performed. The normal platelet count ranges from 400,000 to 900,000 per cubic millimeter. For the bleeding time, the methods of Duke,[4] by which the ear is punctured, and Ivy[5] are utilized. Satisfactory results are obtained with the Duke method with a sharp no. 11 Bard-Parker knife blade, with which the ear lobe is quickly pierced. The normal bleeding time is 1 to 3 minutes by this method. As a rule the lower the platelet count, the more prolonged is the bleeding time. Bleeding times in excess of 5 minutes are definitely abnormal. Bleeding times in excess of 10 minutes are usually associated with extreme reductions in platelet counts.

The tourniquet test is performed either by placing a tourniquet around the arm for a few minutes or, more accurately, by the method of Wright and Lilienfeld.[6] In this standardized technic, the blood pressure cuff is kept maintained at a level halfway between systole and diastole for 15 minutes and the number of petechiae counted in a circle 2.5 cm. in diameter and 4 cm. below the bend of the elbow. As a rule, the lower the platelet count, the more pronounced is the positiveness of the result of the tourniquet test, i. e., the greater is the number of petechiae present. The clot retraction is determined by observation of the behavior of the clot of 1 cc. of blood in a test tube at intervals of 30 minutes and 1, 2 and 24 hours. Normally, retraction of the clot from the walls of the test tube begins in 30 minutes, is appreciable by 1 hour and is complete in 3 to 24 hours.

In the presence of abundant platelets on smear, a normal bleeding time and a negative result of a tourniquet test, idiopathic thrombocytopenic purpura and, in fact, almost all other hemorrhagic disorders which women may be subject to can be discarded. In the presence of abundant platelets, a distinctly increased bleeding time and/or a distinctly positive result of a tourniquet test, one can make the diagnosis of some form of vascular purpura, including that known as pseudohemophilia.[7] In the latter an increased bleeding time is the outstanding or central manifestation and is probably due to a disturbance in capillary retractility following trauma. It hardly ever is necessary to consider an increased coagulation time as the cause of abnormal bleeding in a woman. One can make a simple and fairly accurate test of the clotting time by placing 1 cc. of blood into a clean 5 or 10 cc. test tube and observing the presence or absence of clotting every 5 minutes by gently tilting the tube. More accurate tests for the coagulation time may be made.[3]

Thus, with only a few simple tests which can be readily performed at the bedside or in the physician's office, the diagnosis of a serious hemorrhagic disorder can be readily made or disproved. However, the important thing is for the physician not to forget that menorrhagia may indicate a hemorrhagic disorder rather than a local uterine condition or an endocrine disturbance.

In the diagnosis of thrombocytopenic purpura, the observation of a great diminution in blood platelets is of prime importance. In a laboratory where platelet counts are not regularly and routinely performed, enumeration of platelets by the various methods may often be erroneous and misleading. The simplest method for an approximate enumeration of the platelets is through an examination of a well spread and well stained cover slip blood smear. With a little practice, one can learn quickly to recognize a definite diminution in the blood platelets. Confirmation of the diagnosis is obtained by use of other tests. Sternal puncture is of outstanding importance, not only as a means of ruling out leukemia and other abnormal conditions involving the marrow but to note the characteristic histologic features of idiopathic thrombocytopenic purpura, i. e., increased numbers of megakaryocytes and greatly diminished platelet production. Splenectomy is to be considered as soon as the definite diagnosis of idiopathic thrombocytopenic purpura has been established.

SUMMARY

Four cases of idiopathic thrombocytopenic purpura with menorrhagia were observed, in each of which various gynecologic operations, including dilation and curettage and hysterectomy, were performed without any effect on the profuse bleeding. This suggested the definite likelihood that idiopathic thrombocytopenic purpura might be present.

The various tests by which the diagnosis of idiopathic thrombocytopenic purpura is made are described. It is suggested that each patient with menorrhagia (or other bleeding tendency) as a symptom should have at least a blood smear examination, to rule in or out the presence of diminished platelets. Performance of this and other simple hematologic tests would go far toward reducing the number of unnecessary gynecologic procedures in cases of menorrhagia.

DIAGNOSIS OF HELMINTHIASIS

ELMER H. LOUGHLIN, M.D.
and
SAMUEL H. SPITZ, M.D.
Brooklyn, N. Y.

The parasitic infections have traveled throughout the centuries at the forefront of the scourges afflicting the human race, surpassing even cancer, tuberculosis and plague. Not the least important of these are the helminth infections of the gastrointestinal tract, of which two, hookworm and schistosomiasis, are ranked with malaria as the most dangerous diseases of mankind.

Stoll[1] estimated that there are 72,000,000 tapeworm, 148,000,000 fluke and more than 2,000,000,000 roundworm infections distributed throughout the world, a number exceeding the total of the world population. Well over half of these infections reside in the gastrointestinal tract. A not insignificant percentage of them is encountered in the United States and Canada. Again, he calculated that there are about 18,000,000 Enterobius, 2,000,000 hookworm, 3,000,000 Ascaris, 400,000 each of Trichuris and Strongyloides and 100,000 each of Taenia and Hymenolepis infections. The addition of 21,000,000 Trichinella infections elevates these already startling numbers to a really staggering total.

Since World War II, species of worms other than those indigenous to this country have been encountered in returning servicemen, among whom 1 in 15, with duty in the Pacific area, carried home infections with Ancylostoma duodenale, the Old World hookworm. Thus, the possibility of the establishment of another and more resistant variety of hookworm in our southern states becomes likely.[2] With the repatriation of American prisoners of war,[3] the release of servicemen from areas where Schistosoma japonicum was endemic, and the recent immigration of large numbers of persons from the Caribbean islands where Schistosoma mansoni was abundant, American physicians are confronted with problems relating to these infections, as well as to the infections with autochthonous helminths.

DIAGNOSTIC METHODS

Despite the enormous numbers of these diseases and the diverse problems that arise from them, relatively little has been accomplished in the way of diagnosis and treatment. This is particularly true of the gastrointestinal helminth infections. Although practicing physicians and laboratory technicians are well acquainted with the diagnostic tests used in bacterial, spirochetal and viral diseases, relatively few are more than vaguely familiar with the laboratory procedures necessary to diagnose infections with helminths. This apparent lack of interest is due chiefly to the fact that certain of the technics which are in use today are difficult to perform and require special equipment and, even after completion, they are deficient in results. Also, there is scant knowledge concerning the sequence in which they should be employed.

Most of the diagnostic technics in vogue today differ only slightly from the concentration technics of Bass,[4] introduced in 1909 in this country, and of Telemann,[5] published in 1908 in Germany. The latter, nothwithstanding its inadequacies, is still used in many investigative centers. Bass recommended an elaborate technic, using a 1:10 fecal water emulsion, strained through gauze and centrifuged repeatedly through a series of solutions with specific gravities ranging from 1.000 to 1.250. This procedure, designed for diagnosis of light hookworm infections, required from twenty-five to thirty minutes per specimen to perform before microscopic examination of the smear could be started.

Technics described in modern texts of clinical laboratory methods are similarly complicated. The extensive contact with malodorous excrement is usually enough to stifle the enthusiasm of the most ardent diagnostician. Some methods require actual weighing of fecal material, as well as straining of emulsions through gauze; others use large jars for sedimenting and decanting which take up considerable space; some are effective for only eggs that float, others, for eggs that sink; few are effective for both types. Most of these are not suitable for use in the average laboratory, and, when all factors are considered, it is little wonder that the ordinary fecal water smears with their inadequacies are almost universally relied on for diagnosis.

In 1945, one of us (E. H. L.) and Stoll, cognizant of the deficiencies of these technics, but also realizing that the Telemann technic did concentrate to a certain extent operculate as well as nonoperculate eggs, expressed the view that it could be modified to provide adequate concentration of all ova. Using a solution of hydrochloric acid with a specific gravity of 1.030, which permitted the sedimentation of ova, as well as providing adequate comminution of the feces, and a mixture of ether and xylene, which diminished the adhesiveness of the fecal debris, we gradually devised the acid-ether-xylene (AEX) method.[6] When compared with technics such as the Lane DCF (direct centrifugal flotation), Willis brine flotation, Faust zinc sulfate flotation, Telemann hydrochloric acid-ether and the de Rivas acetic acid-ether methods,[7] the AEX technic was found to have a superior degree of diagnostic efficiency.

Although yielding excellent quantities of ova, the use of acid had certain handicaps, viz., distortion of some eggs and corrosion of the microscope objectives, the latter caused by the escape of acid fumes from beneath the cover slip. Therefore, search was made for a substitute for the acid which would overcome these difficulties. Two wetting agents, calgon® (sodium

hexametaphosphate) and laboratory aerosol® (dioctyl sodium sulfosuccinate N.F.), were found to meet the necessary requirements. Ether and xylene, with a 5 per cent solution of calgon®[8] (CEX technic), the latter replacing the acid, delivered even greater yields than the AEX method and without any distortion of the eggs. Laboratory aerosol® also was found to be a satisfactory substitute, shortening and simplifying the technic. Furthermore, it reduced the quantity of xylene. In a series of comparisons with CEX and AEX concentration technics and dilution counts, the method using aerosol,® too, was found to possess excellent diagnostic efficiency.[9] Because this method can be adapted to routine laboratory use and has proved to be a valuable diagnostic aid, a description of it will be given.

SALINE-AEROSOL®-ETHER-XYLENE TECHNIC FOR CONCENTRATING HELMINTH OVA AND PROTOZOAN CYSTS

1. Measure 4 cc. of feces into a dilution counting flask which has been filled to the 56 cc. mark with isotonic sodium chloride solution and add 8 drops of laboratory aerosol.®
2. Add several glass beads (6 mm.), and after giving the preparation an initial shaking, set aside in the refrigerator for several hours or overnight. When removed, complete the comminution of the feces by vigorous shaking, thus assuring adequate distribution of the eggs throughout the fecal suspension.
3. Transfer 1.5 cc. of the suspension immediately to a 15 cc. pointed centrifuge tube.
4. Add 3.5 cc. of isotonic sodium chloride solution, 5 cc. of ether and 2 drops of xylene. Put a rubber stopper in the tube and shake for thirty seconds.
5. Centrifuge at about 2,000 revolutions per minute for one and one-half minutes and allow the centrifuge to come to a stop gradually without interference.
6. Separate the floating coagulum from the walls of the tube with a thin wooden applicator.
7. Decant quickly, without disturbing the sediment in the bottom of the tube. Then, while holding the tube almost horizontal, clean off any coagulum adhering to the inside of the tube with an applicator covered with gauze.
8. Add 1 or 2 drops of isotonic sodium chloride solution to the sediment. Mix thoroughly with a capillary pipet; transfer the entire suspension to a 1½ by 3 inch (3.8 by 7.6 cm.) glass slide and place a 22 by 30 mm. cover slip on it.
9. Examine the whole preparation for eggs. Those found are from 0.1 Gm. of the original fecal specimen.

This procedure requires little special equipment and, although we prefer to use the Stoll displacement flask, any container similarly marked for measurement may be substituted. A little caution in decanting will be necessary in order not to disturb the sediment. Protozoan cysts may be stained with iodine solution.

Whenever eggs are demonstrated, the contents of the displacement flask may be used for dilution counting without any additional preparation.

A DIAGNOSTIC WORKING PLAN

Because of our location in a large urban community where persons of many nationalities and derivations tend to congregate, bringing with them the parasites indigenous to their native soil, as well as the other commoner parasitic infections, we have found it expedient to adopt a working plan for their diagnosis. Realizing that symptoms alone are unreliable, we have by employing such a systematic approach uncovered in these recent arrivals a number of unusual infections with helminths and protozoa. It is evident that not all the procedures included in our program are applicable in areas with a less cosmopolitan population.

A complete history is obtained, with emphasis on native country or travels, military duty, occupation, customs, habits and opportunities for exposure. After physical examination and routine analysis of the blood and urine, as well as other indicated chemical and serologic tests, specific diagnostic studies are then made. These include fecal examination, Scotch® tape smears, proctoscopy and rectal biopsy, as well as cutaneous tests and pertinent serologic tests.

Fecal Examination.—For routine examination a spontaneously passed stool is preferred. The patient should not be given a cathartic, since it should be realized that a formed stool, gram for gram, contains four times as many eggs as a liquid stool. However, since it is practically impossible to distinguish the species of Taenia by their eggs, it may be necessary to give a cathartic to loosen some of the segments for examination. We advise the patient to pass the specimen directly into a container provided for him, permitting us to judge the portions of feces most suitable for examination. For example, in a search for schistosome eggs the entire 4 Gm. specimen for concentration should be taken from the periphery of the formed stool. The specimen should be examined macroscopically for consistency, blood and mucus, as well as for parasites. Pinworms may occasionally be noted. The finding of motile proglottides of Taenia saginata is of value, since these may crawl off the stool before discharging their eggs, so that the infection may be missed on microscopic examination.

Next, a water fecal smear is examined under the low power of the microscope. The chief handicap of the fecal smear is that not enough material can be examined. When this deficiency is realized and selection is made of the proper portion for examination, it does serve as a valuable diagnostic aid. Selection of bits of mucus or blood when present in examination for schistosome ova is advisable, since these are characteristically deposited on the stool while it is in the lower bowel and, therefore, are oftenest found in such portions of the specimen. In light infections several such areas should be examined microscopically. For other helminth diagnoses, such as hookworm, Ascaris and Trichuris, almost any portion of the stool may be examined, since the ova are ordinarily distributed throughout the specimen. It should be realized, however, that at least 1,200 hookworm eggs per gram of feces are required before detection is regularly possible. Thus, it becomes apparent that the fecal smear, except in infections with Diphyllobothrium latum, in which eggs are usually abundant, must be limited to the diagnosis of moderate and heavy infections, and, in these circumstances, it may be used as a rough measure in determining the necessity for treatment.

Saline-Aerosol®-Ether-Xylene Concentration or CEX Concentration.—Either of these concentration technics will be required to detect light infections with hookworm as well as other helminths. An otherwise obscure eosinophilia may be explained by their discovery.

Scotch® Tape Anal Smear.[10]—In practice we find this to be the most suitable means of diagnosing pinworm infections. A strip of cellulose tape, sticky side out, is placed over the butt of a test tube and firmly pressed against the anal folds. The tape is then applied adhesive side down to a glass slide. Just prior to microscopic examination, the tape is lifted and a drop of water is placed on the slide in the area of the smear and the tape reapplied. Due to the nocturnal periodicity in migration and egg laying of the female Enterobius, patients should be advised not to defecate or clean the perianal area before the examination. Contrary to common opinion, Enterobius eggs, except in very heavy infections, are rarely found in fecal smears.

"Charcoal Culture."—In suspected infections with Strongyloides portions of fecal material are mixed with powdered animal charcoal, moistened with tap water, placed on a moist filter paper in a Petri dish and permitted to remain at room temperature for several days, when the characteristic filariform larvae may be found. These, because of their more slender form, long esophagus and notched tail, are readily distinguished from the filariform larvae of hookworm.

Proctoscopy.—In schistosome infections as much information can be obtained by proctoscopy as sigmoidoscopy yields in amebiasis of the sigmoid and rectum.

Rectal Biopsy.[11]—In suspected as well as proved cases of schistosomiasis we routinely take material for biopsy from the edge or lower surface of the middle rectal valve, removing a 2 to 3 mm. specimen through the proctoscope with a rectal biopsy forceps. This specimen is then placed in a few cubic centimeters of tap water to clear for several minutes. After pressing it flat between two slides, it is then covered with a drop of water and a cover slip applied. Schistosome eggs may be found scattered throughout the tissue. They may be alive, containing active miracidia, or dead and black. This procedure has been employed by us in well over 150 patients without complications and with no more discomfort than that caused by proctoscopic examination alone.

DIFFERENTIAL DIAGNOSES

The clinical symptoms of infections with intestinal worms are deceptive and may mimic other organic maladies. For example, a patient may complain of fatigability, weakness, abdominal distress, hunger pains and constipation and on examination may present pallor and tenderness in the upper part of the abdomen, a picture suggesting peptic ulcer. However, it is not unusual to find a patient with hookworm disease presenting the same symptoms. Infection with Fasciolopsis buski, the large intestinal fluke, may cause similar complaints. Another patient may complain of intermittent or chronic diarrhea and colicky abdominal pains, which may be symptoms of any one of a number of colonic diseases, including chronic bacillary dysentery, amebic infection or even cancer. The added finding of eosinophilia may suggest an allergic condition. However, infection with Strongyloides stercoralis will reproduce exactly this picture.

Ascaris lumbricoides, the large roundworm, because of its "wanderlust," may enter the bile ducts, crawl through the stomach and esophagus to appear at the nares or pass through the eustachian tube and exit from the external auditory meatus. It not infrequently perforates the intestine to produce peritonitis. When disturbed by improper treatment or insufficient anthelmintic medication, the ascarides may "ball up" and produce intestinal obstruction.

Löffler's syndrome with pulmonary involvement not infrequently accompanies established infections with ascaris, as well as hookworm.

Trichuris trichiura, or whipworm, because of its peculiar mode of attachment to the mucosa of the cecum, may permit the entry of pathogenic bacteria, and not infrequently heavy infections produce a picture suggesting appendicitis. We have seen cases of peritonitis and septicemia, both due to streptococci and Clostridium perfringens, arising from what apparently was an insignificant infection with Trichuris.

The gastrointestinal symptoms of Enterobius vermicularis, or pinworm, infection are sufficiently well known to avoid repeating. There are, however, patients with pruritus ani, even nocturnal in periodicity, who are treated with radical measures without thought of the possibility of infection with these parasites. As a result of failure to relieve the symptoms a severe neurosis may be precipitated.

The commoner tapeworms, T. saginata, or beef tapeworm, and Hymenolepis nana, or dwarf tapeworm, are usually innocuous and produce few symptoms other than occasional unusual desires for certain foods, not unlike those of the pregnant woman or the diabetic patient, although the Hymenolepis, in heavy infections, may produce such symptoms of toxicity in children as loss of weight, nervousness and, even, convulsions. On the other hand, Taenia solium, or pork tapeworm, following autoinfection with the eggs, may produce cysticercosis of the brain, with symptoms suggesting brain tumor or epilepsy, and of the eye, with its destruc*tion. D. latum, or fish tapeworm, may occasionally* be associated with a macrocytic anemia. Echinococcus, or dog tapeworm, the larval forms of which may infect man as an intermediate host, produces echinococcus cysts of the liver, spleen, lung, bone or kidney.

Infections with the schistosomes, or blood flukes, after their establishment in the veins of the colon usually manifest themselves by colitis with anemia, eosinophilia and secondary nutritional disorders and vitamin deficiencies. Complications, such as hepatic cirrhosis and splenomegaly, are commonly encountered, not infrequently with ascites. Ectopic parasitism of the brain, particularly with S. japonicum, causing symptoms of tumor, are occasionally seen.

During the early stages of infection with Trichinella spiralis, or pork worm, the symptoms may resemble those of acute gastroenteritis or influenza, and at this time more than a presumptive diagnosis is difficult to make. Eosinophilia and periorbital edema appear first in the stage of larval deposition and encystation. In the latter phase the cutaneous test with trichinella antigen and precipitin and complement fixation tests when the reactions are positive indicate the nature of the disease. The search of tissue and body fluids for larvae, except in heavy infections, is tedious and usually does not warrant the effort.

CONCLUSION

Thus, in the majority of cases, the clinical manifestations of infections of the gastrointestinal tract with helminths must be closely correlated with the results of fecal and other pertinent examinations. The diagnosis of these infections, therefore, is to be found in the laboratory rather than in the bedside or office examination. Judgment, however, should be exercised in directing diagnostic procedures, and the fact that a patient may have a parasitic infection due to worms or protozoa does not exclude the possibility of coexisting organic disease.

Hernandez-Morales, F., and Maldonado, J. F.: Diagnosis of Schistosomiasis Mansoni by Rectal Biopsy Technique, Am. J. Trop. Med. **26**: 811-820 (Nov.) 1946.

We believe that most of these procedures are so simple and practical as to be within the scope of the practitioner of gastroenterology or medicine and that they will enable him to make a diagnosis in what might otherwise be an obscure condition.

ABSTRACT OF DISCUSSION

Dr. Norman R. Stoll, Princeton, N. J.: To a parasitologist there are two points about this paper that are of special interest. The first is the evidence that we are moving in the direction of greater efficiency and convenience for the practitioner in the diagnosis of infections with helminths. The second is that it is the physician with an interest in parasitologic problems who is contributing to these improvements. Dr. Loughlin and Dr. Spitz may have passed over a little too hastily the history of the development of methods for fecal diagnosis. The logical procedure to discover whether or not any eggs are present in intestinal discharges is the examination of some type of concentrated sediment obtained from feces. For special types of eggs, special technics to float those which float (as hookworm) may be rapid and efficient. But to get a comprehensive diagnosis of whether any eggs are present, the technic must, of course, bring to view those that do not float as well as those which do. As Dr. Loughlin made clear, this points to some modification of the Telemann concentration technic as a mainstay. The amendments Dr. Loughlin and I made of it on Guam are now further improved on by the substitution of such detergents as calgon® and laboratory aerosol.® Other workers have also suggested the use of detergents. The virtue of the Loughlin-Spitz recommendation is the precise combination of materials and steps by which a known degree of efficiency is secured. Second, I do not need to belabor the point that the nonmedical specialist may not always appreciate certain attributes of technics considered valuable from the practitioner's standpoint. Dr. Loughlin and Dr. Spitz do, and their efforts should hasten the day when the casual approach to fecal diagnosis of helminth infection, which I think it is fair to say characterizes the average practitioner, may be replaced by a more technically competent approach.

Dr. Donovan C. Browne, New Orleans: I have seen patients given even psychosomatic treatment only to find a few months later that they are worm infested. It must be kept in mind that many of these infections cause no symptoms at all; as a matter of fact, in our studies my colleagues and I found that in these infections from 38 per cent down to 0 of the group of symptoms in the patient's presenting complaint bears no relation to the helminthiasis and is simply concomitant at the time. The worms should be removed then, but the patient should be examined carefully.

Dr. Loughlin: Because of the shortness of time I had to omit several pages, and it was in those that we discussed symptomless infections. We were quite successful in detecting such infections by using the methods described in this paper. I have no idea of how many have used the zinc sulfate concentration technic as a routine procedure, but we employed it in a number of instances. The objection to this procedure is that, although it seems simple on first reading, repeated washing and resedimentation are necessary to get a satisfactory film at the top of the tube. This takes much of the technician's individual attention and time, and, when time is an important factor and a large number of specimens must be run through in routine diagnosis, we found that this procedure is not practical. With the laboratory aerosol®-ether-xylene method which I discussed here, the eggs of schistosomes were detected as readily as with the CEX method, and these procedures are remarkably effective in the diagnosis of schistosomiasis when compared with rectal biopsies.

Council on Physical Medicine

REPORTS OF THE COUNCIL

The Council on Physical Medicine has authorized publication of the following reports. Howard A. Carter, *Secretary.*

KEAT METHOD AND FILTER FOR EPILATION BY ROENTGEN RAYS NOT ACCEPTABLE

Address: Keat, Inc., Suite 1763, 17 North State St., Chicago.

Now and then the Council on Physical Medicine is called on, in order to fulfil its assumed obligations to the medical profession and the public, to investigate and render reports on methods and products which it considers detrimental to the public health and welfare. One such method is that employed by Keat, Inc., of Chicago, Omaha and Kansas City. In response to questions as to the safety and effectiveness of a method of epilation practiced by this firm, the Council on Physical Medicine has prepared the following report:

From the evidence it would appear that the Keat Method is based on a patent by Violet Arnold, No. 2,389,403, dated Nov. 20, 1945. The document states that it is "an object of this invention to provide a treatment for removal of hair from the human body without injury to the body tissue." It claims that this object "is achieved by subjecting the portion of the body from which the hair is to be removed to x-rays as modified by filters of varying thickness and construction including a laminated aluminum and water filter." The procedure is further described as a "method of permanently removing hair from the human body comprising the steps of subjecting the portion of the body from which the hair is to be removed to x-rays from a tube to which is applied 60 to 70 kilovolts, filtering the x-rays in three successive daily treatments respectively, of five to ten minutes exposure, through one-half millimeter of aluminum, one millimeter of aluminum, and a laminated filter constituting spaced sheets of aluminum and an intervening body of water, repeating a plurality of daily exposures after elapse of three to five weeks, and subjecting the treated portion to monthly exposure of ten to fifteen minutes through the laminated filter eight to twelve weeks following the second group of daily exposures."

Radiation Intensities

	Keat Without Water	Keat with Water	Aluminum Filter, 2 mm.	Aluminum Filter, 1 mm.
No additional filter.........	12.6	12.0	9.2	12.8
Added ¼ mm. copper.......	3.4	3.4	3.4	....
Added 1 mm. copper........	0.95	0.95	0.95	....

The essential part of the patent appears to be the specially designed filter consisting of two sheets of aluminum with a gasket fastened between them in such a way that it creates a thin space enclosing, or at least capable of enclosing, a layer of water between the two layers of aluminum. The layers of aluminum are stated each to be 0.5 mm. thick and the layer of water is intended to be 1 mm. thick. The document contains the statement, "I am aware of the fact that other metals than aluminum can be used for the filters as, for example, copper-lead, tin and silver." From this it appears that the essential feature is the layer of water. Since some theoretic interest attaches to the possibility of altering the spectral quality of roentgen rays filtered by this device, the following data are quoted from the report of a skilled radiation physicist who studied the device. The specimen secured for examination was found to contain only about 0.1 cc. of water in its cavity; calculation shows that the space ought to have contained more than 7 cc. When the space was so filled with water, the accompanying transmission data were obtained, the figures being stated in r/m at a distance of about 25 cm.

The results set forth in the table are in agreement with theoretic considerations which indicate that the addition of this layer of water in the aforementioned system does not bring about a significant gain in the homogenization of the beam. The water here has no special virtue as a filter to permit penetration of the beam to subcutaneous parts without injuring the skin. It was concluded that this filter had no advantage over ordinary aluminum filters for protecting the skin while irradiating subcutaneous structures.

Reports from the clients of Keat, Inc., have been difficult to interpret because there are indications that the roentgen rays are supplemented at least occasionally by another depilatory procedure using a wax.

The dangers of using roentgen rays for the treatment of hypertrichosis have been set forth in an article by Cipollaro and Einhorn in The Journal of the American Medical Association (135: 349-353 [Oct. 11] 1947). The evidence in the Council files indicates that hair can indeed be removed by roentgen rays and that this epilatory effect is not abolished by filtering the rays through an aluminum filter. However, the evidence also shows that roentgen rays are too dangerous to be used for this purpose. A single large dose, or smaller doses repeated over long periods of time, will cause damage to tissues that may not be noticeable at the time of treatment but may come to light years after the administration of the roentgen rays. The injury has been known to become manifest as pigmentation, depigmentation, telangiectasia, wrinkling, atrophy, keratoses, ulceration and finally carcinoma. These facts have been reported and stressed repeatedly in medical literature by the pioneers who worked with roentgen rays and radium.

The Council on Physical Medicine, after careful consideration of the evidence available, voted to declare the Keat Method and Filter for Epilation by Roentgen Rays unacceptable and to advise the profession of its opinion in a published report.

MULLIKIN PORTABLE RESPIRATOR NOT ACCEPTABLE

Manufacturer: W. J. Mullikin Company, 1010 Vermont Avenue, N.W., Washington 5, D. C.

The Mullikin Portable Respirator is designed for giving artificial respiration for a limited period of time. According to the manufacturer it is not intended to take the place of the tank type of respirator but is an emergency unit. The firm calls it a Mullikin Portable Iron Lung, and the word "Millikin" is also used at times.

The principle by which the respirator functions is essentially the same as that of other small respirators of the cuirass type. The negative pressure is created by a small bellows, which is operated by an electric motor.

The aluminum cuirasses come apart in anterior and posterior halves for application to the patient. The two parts may be secured tightly by wing nuts. Rubber bands are employed to join the cuirass to the patient to make the enclosure air tight. Separate rubber sleeves may be slipped over the patient's arms and fitted to the recesses prepared for them on the cuirass.

The Council on Physical Medicine has inspected two Mullikin Portable Respirators of the cuirass type. In both instances the investigator reported mechanical limitations and failures: for example, the air tube did not attach firmly to the chest pieces, the control switch for the rate of respiration was labeled wrong (when turned in the direction marked "Increase" the pump slowed down and when turned in the opposite direction, marked "Decrease," it speeded up), the rubber collar did not slip over the head easily and the abdominal seal was not comfortable.

The method of promotion may be of interest to the medical profession and hospital management. A large white trailer on which was written "This Millikin Portable Iron Lung to be Presented. . . ." has been used and the names of a local club as donor and a hospital (as recipient) have been mentioned. Arrangements are provided for contributions to finance the project.

The foregoing report was referred to the W. J. Mullikin Company for comment prior to publication. In its reply the company requested the Council not to publish the report in The Journal until the Council has more pertinent facts. The manufacturer pointed out that the two respirators which have been investigated were no longer being promoted; that the Council had not tested any new equipment, so that the foregoing statements would be misleading; that the new respirators have plastic cuirasses, and that a new style collar is now being used.

The Council replied that the next step obviously would be for the firm to submit a new model of the Mullikin Respirator for consideration. Ample time has been given the company to submit an apparatus, but the Respirator has not been received. Therefore, the Council on Physical Medicine reaffirms its previous stand not to include the Mullikin Portable Respirator in its list of accepted devices because (1) it was found to be mechanically imperfect and (2) sufficient evidence to substantiate its efficacy for emergency purposes has not been made available.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

FOLIC ACID (See New and Nonofficial Remedies 1948, p. 558).

The following dosage form has been accepted:

Abbott Laboratories, North Chicago, Ill.

Solution Folic Acid: 15 mg. per cc., 1 cc. ampuls. Each cc. contains folic acid 15 mg. and methylglucamine 24 mg. as solubilizing agent.

Tablets Folic Acid: 5 mg.

INFLUENZA VIRUS VACCINE, TYPES A AND B (See New and Nonofficial Remedies 1948, p. 488).

The following dosage form has been accepted:

The National Drug Co., Philadelphia 44

Influenza Virus Vaccine, Types A and B: Packages of 1 cc. and 5 cc. vials. Preserved with sodium ethylmercurithiosalicylate .01 per cent.

PROTEIN HYDROLYSATES (See New and Nonofficial Remedies 1948, p. 416).

The following additional dosage form has been accepted:

Mead Johnson & Company, Evansvlle 21, Ind.

Solution Amigen 3⅓% with Dextrose 3⅓% in ⅓ Lactate-Ringer's Solution: 500 cc. bottles. Each 100 cc. contains 3⅓ Gm. of Amigen and 3⅓ Gm. of dextrose in ⅓ the usual concentration of lactate-Ringer's solution.

PENICILLIN (See New and Nonofficial Remedies 1948, p. 148).

The following dosage forms have been accepted:

Abbott Laboratories, North Chicago, Ill.

Tablets Crystalline Potassium Penicillin G (*Buffered*): 50,000 and 10,000 units. Buffered with calcium carbonate 0.25 Gm.

Crystalline Potassium Penicillin G: 5,000,000 unit vials.

Troches Crystalline Potassium Penicillin G: 1,000 and 5,000 units.

Premo Pharmaceutical Labs., Inc., South Hackensack, N. J.

Crystalline Procaine Penicillin G in Oil: 300,000 units per cc., in sesame oil with aluminum monostearate 2 per cent W/V, 1 cc. glass syringes.

The Upjohn Company, Kalamazoo 99, Mich.

Tablets Crystalline Potassium Penicillin G (*Buffered*): 50,000, 100,000 and 250,000 units. Buffered with calcium carbonate 0.25 Gm.

Ointment Calcium Penicillin: 1,000 units per gram, 28.35 tubes.

Ophthalmic Ointment Calcium Penicillin: 1,000 units per gram, 3.0 Gm. tubes.

Troches Crystalline Potassium Penicillin G: 5,000 units.

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

SATURDAY, APRIL 9, 1949

AMERICAN ACADEMY OF PEDIATRICS REPORT

In 1948 the American Academy of Pediatrics, in cooperation with the United States Public Health Service and the United States Children's Bureau, completed a nationwide study initiated in 1944 of child health services. The study was supported by several leading voluntary health agencies. The survey included an analysis of the services of physicians and dentists in private practice, of hospitals and community health agencies and of pediatric education in our medical schools. The complete record of the studies just made available has been published by the Commonwealth Fund under the title "Child Health Services and Pediatric Education."[1]

The frequently made statement that heart disease, cancer and mental illness are the number one health problems of this country is challenged by the suggestion that the future of the nation is primarily dependent on our children and that the real number one health problem is how to make good medical care available to all infants and children. Statistics indicate that the children of the United States are among the world's healthiest, but the fact remains that our states are not equally effective in child health programs. In some states practically all babies receive the protection of hospital services at the time of birth; the survey indicates that at least 100,000 babies are born each year without medical attention of any kind. In some states only half the babies are born in hospitals. Obviously the quality of medical service given to babies and children depends on the availability of competent general practitioners and specialists. The survey reports that three fourths of the private care of children of the nation is given by general practitioners. Both the quantity and the quality of pediatric training given to general practitioners are said to be inadequate, if judged by the services given to infants and children in cities with 50,000 or more population. Three fourths of the practicing pediatricians are in such cities, and one half of all the pediatricians are in the communities that have medical schools.

In a brochure issued for the public, the American Academy of Pediatrics emphasizes particularly the variations between the amount and quality of medical service over the United States as a whole. Thirteen million children live in isolated counties where there are deficiencies not only of doctors but also of hospitals and other medical facilities. The report indicates that 46 per cent of the hospital care given to infants is in hospitals in which infants are not separated from older children who are sick; indeed, in many hospitals children may be in the same wards with sick adults.

The report focuses attention on the question of training in pediatrics given to students in our medical schools, as fundamental to every aspect of the problem of child care. More clinical instruction is urged, including more clinical teaching hours. For this more money will be needed to recompense teachers who must take such time away from their practices. While a few medical schools provide three hundred hours of clinical teaching in pediatrics for undergraduates, the average is one hundred and sixty-one hours, and one school was found which provided only twenty-eight hours of pediatric teaching. A second recommendation suggests the provision of financial aid in the form of fellowships for medical students who have completed internships and residencies. The program includes also affiliation of outlying hospitals with medical schools and weekly visits by specialists from medical centers to such regional hospitals; thus graduate training in pediatrics may be decentralized and pediatric service made available in outlying areas. The brochure comes to the ultimate conclusion that more money is needed for teaching pediatrics, that the budgets of departments of pediatrics in medical schools must be strengthened and that the whole program must ultimately rest on immediate improvement of the quantity and quality of teaching pediatrics to medical students, interns, residents and practicing physicians.

GOVERNOR WARREN'S CALIFORNIA HEALTH INSURANCE PROGRAM

For the third time, Governor Warren is now advocating a compulsory health insurance program for California. In a message to the legislature January 3, he claimed that millions of people in California cannot pay for adequate medical care "without crippling their finances and without depriving themselves of other things that are needed to raise a good American family." He urged legislative adoption of a system of "health insurance to which everyone contributes and through which everyone will receive benefits in time of sickness."

---

[1] Child Health Services and Pediatric Education: Report of the Committee for the Study of Child Health Services of the American Academy of Pediatrics, with the cooperation of the United States Public Health Service and the United States Children's Bureau, New York, The Commonwealth Fund, 1949.

Shortly thereafter a bill reputed to embody the governor's ideas, S. 157, to enact the "California Prepaid Health Service Act," was introduced in the California Senate. The program would be financed, in part, by compulsory payroll taxes, referred to as "contributions," imposed on employers and employees. The existing Department of Employment and a newly created Health Service Authority would administer the Act. This Authority would include the director of public health as chairman, the chief executive officer of the Department of Employment, three physicians, two representatives of labor, two representatives of employers and one dentist, the last eight members being appointed by the governor. An executive director of the Authority would be appointed also by the governor but on nomination by the Authority. A medical advisory board, a hospital service advisory board and an advisory committee on postgraduate study would be established, all of which would have no other responsibilities than giving advice.

The Act would establish a Health Service Fund created by the "contributions" exacted of employers and employees. Any person who cared to attest his reliance on healing by prayer in the practice of religion might on request be excused from contributing to the fund and would then be ineligible to receive the benefits. An employee and each of his dependents will be eligible for health services during any calendar quarter if during the preceding calendar quarter the employee was paid wages in employment of not less than $150. A person who was unable thus to qualify for benefits may nevertheless become eligible if during the preceding calendar year he was paid wages of $750 or more.

An eligible beneficiary will receive—the bill promises—medical, hospital and laboratory services as defined in the bill from a physician or hospital of his choice for a period of not to exceed one hundred days for each continuous period of disability or hospitalization. Medical services will consist of services rendered by a physician licensed in the state whenever such services are required by the standards of good medical practice for preventive, diagnostic, therapeutic or other medical treatment or care of a beneficiary necessarily confined in a hospital as a registered bed patient, and such posthospital medical care as may be necessary and allowed under rules of the Authority. Embraced in the term, too, will be the services rendered by dentists licensed in the state when performed in a hospital for the treatment of the diseases and injuries of the jaws and their dependent tissues, excluding tooth removal, tooth replacement, tooth restoration, orthodontics and treatment of pyorrhea.

Hospital services, within the meaning of the bill, will consist of the following services when necessary and prescribed by the attending physician: bed and board in a ward or semiprivate room, services of a dietitian, general nursing care, use of operating or delivery room including surgical and anesthetic supplies and the use of cystoscopic rooms. Such drugs, biologics, bandages, dressings, oxygen, blood and plasma will also be supplied as they may be required during the period of hospitalization. Laboratory services will be supplied in the hospital, but the Authority may authorize beneficiaries to obtain the laboratory services outside of the hospital in standard laboratories approved by the Authority when necessary and prescribed by the physician. The Authority may require in cases other than obstetric and those necessitating surgical treatment the payment of bed and board charges for a period not to exceed two days and the payment of a part of the cost of laboratory services not to exceed $10 in connection with any single disability for services rendered outside of a hospital. The Authority may also permit, in special cases, special nursing services, convalescent care in a rest home and private room where isolation is required, all under such conditions as the Authority may provide by rule.

If and when the financial resources of the fund permit, the Authority may provide additional benefits, such as physical therapy treatments, ambulance service and material appliances.

If an eligible beneficiary receives earnings in excess of $1,500 during the qualifying calendar quarter or receives earnings in excess of $6,000 during the qualifying calendar year, he will receive in lieu of medical services reimbursement for such services in accordance with the fee schedule adopted by the Authority. The Authority will be authorized by rule to prescribe "standards of service" and prescribe rates, fees or charges to be claimed and paid for all services furnished beneficiaries, or the Authority may authorize its director to perform these functions.

Article 12 of the bill undertakes to permit an employer to elect to provide health services to employees by means of a voluntary plan and if that plan meets with the approval of the Authority the employer and his employees will be excused from contributing to the fund. The bill spells out in considerable detail, however, the requirements that a voluntary plan must meet before it will merit approval and contemplates that reports concerning the operation of the plan must be submitted to the Authority.

The concluding article of the bill, Article 14, deals with penalties. Unprofessional conduct calling for the revocation of his license is charged against a physician who fails to disclose any "material fact known to him to obtain any service or benefit provided under the act." Each physician who participates in the program will presumably have to determine at his peril what is or is not a material fact. Failure to disclose by physicians and by others is also declared to be a misdemeanor, as is also wilful violation of any rule or regulation promulgated or published to effectuate the program. Scattered throughout the twenty pages of this bill are innumerable statements in which the Authority is authorized by regulation to impose requirements. Apparently any express and clear provision for hearings on these regulations or for their publication in any definite manner is not included; yet a violation of any one of these would constitute a criminal offense. This is the application of the methods of the "police state" at their worst to dominate the practice of medicine politically.

While a beneficiary may utilize more expensive hospital accommodations than those supplied under the bill, by paying the difference in cost, if a beneficiary and a physician mutually agree that the fee for medical services set by the Authority is inadequate and if an additional fee is accepted by the physician, except in the case of a beneficiary entitled to reimbursement only, the license of the physician is made subject to revocation. California physicians would face a precarious and uncertain future if this preposterous bill were to be enacted into law.

SHOE-FITTING FLUOROSCOPES

The National Shoe Retailers Association has begun to receive requests from some of its members for factual data on the use of shoe-fitting fluoroscopes and its ultimate effect. The most recent stimulus, apparently, was an attempt in New York City to force the employment of x-ray technicians to operate such machines. A hearing on the matter was held by the New York Board of Health in 1947, and restrictive rules for operation of such devices were established. Three major medical societies of New York City have condemned their use. In 1948 the American College of Radiology circulated a discussion of the dangers of fluoroscopic shoe fitting in their News Letter.

The American Standards Association in 1946 promulgated the "Safety Code for Industrial Use of X-Rays" (A. W. S. Z 5 4.1), reiterating the American acceptance of a "tolerance dose" of 0.1 r per day of general stray irradiation and setting the specific limit of 2 r per exposure (to the foot) for shoe-fitting machines. This code was quoted to the shoe retailers, but obviously does not alone suffice. They must ultimately decide whether they will recommend continuance or abandonment of their use.

Injuries attributed to shoe fitting have not been reported. One cannot be sure, however, that skin injuries and epiphysial distortions may not have occurred and been attributed to other causes, or merely ignored. From the histories of late roentgen cancer on the hands of roentgen ray pioneers, one can surmise that the time is still too short for this to appear in feet that have been overirradiated, even though erythema has not been observed. From figures available this seems unlikely but not impossible. Consider the severe roentgen injuries that resulted from illicit use of small fluoroscopes in the health departments of some war plants in Los Angeles.

A number of shoe-fitting fluoroscopes of several manufacturers have been measured at one time and another in several cities, as actually in use in retail stores. The dosage rate at the sole of the shoe ran from 11 to 140 r per minute. The high figure resulted from removal of the aluminum foot plate, a change which pleased the salesmen because it made the light so bright! Many machines have an automatic cutout, limiting each exposure to one-fifth or one-half minute. None that is known reduced the single exposure below 4 r, and some went to 50 r. The sole of the shoe reduces this by half if it is a thick sole. The stray radiation at the pelvis runs 0.1 to 0.5 r per minute.

Danger arises from two sources; namely, too high an intensity and uncontrolled length of exposure or repetition of exposures. Without an expert to operate the machine, or at least an indoctrinated employee of special assignment, these dangers could probably not be successfully avoided. The machines will be used in a lighted room (not in the dark with eyes adapted, as the medical radiologist does his fluoroscopy). The 2 r limitation of the code is too stringent from the point of view of satisfying the salesman and the customer—or especially the customer's mother, since these machines have their greatest use for fitting children. If one sets the intensity high enough for easy seeing, the 2 r total arrives before one has finished looking. If one adjusts for a comfortably long look, one is forced to choose too dim a light. However dependably the automatic switch may work to limit the exposure, uncontrolled repetition, in trying another pair, or in going to another shoe store, or even through mere customer's caprice, appears to be unavoidable.

Those who favor the procedure urge that these doses are really rather small compared to what people are often given in medical radiology and that the danger of seriously overdoing the intensity or the repetition is remote. Nevertheless, the injury of even one person in ten thousand could not be condoned if the chance taken yields but small reward.

How necessary is fluoroscopy to get a well fitting shoe? Many a good foot has been made ugly and troublesome by years of badly fitted shoes, far more presumably than have been deformed by roentgen injury. Is it not possible, however, to avoid both hazards by merely fitting shoes carefully, using the ordinary methods of measurement and observation? The bitter fact remains that fluoroscopy simply cannot be really safe in the hands of those untrained to its use and relatively ignorant of its dangers.

Current Comment

THE HILL BILL FOR EXTENSION OF MEDICAL CARE

Elsewhere in this issue (page 1007) appears an abstract of a bill introduced into the Senate of the United States on March 30 by Senator Lister Hill and four other senators associated with him. The bill proposes allocation of federal funds to the individual states, so that state authorities, established in the field of medical care, may secure voluntary hospitalization and sickness insurance policies for persons unable to pay the costs of medical care either in whole or in part. On the local and state authorities is placed the responsibility for determining the need of the persons concerned in each instance. Provision is made for aiding hospitals, health centers and diagnostic institutes so that they may render necessary services to those unable to pay. The measure would thus make effective as law several of the most significant points in the twelve point program for the extension of medical care developed by the American Medical Association. According to reports in the press, Mr. Hill was aided in the development of this legislation by conferences with the American Hospital Association, the president of the Pennsylvania State Medical Society and several other interested individuals and agencies. The measure, which has been considered by the Washington office of the American Medical Association and by the Executive Committee of the Board of Trustees, is a type of legislation that corresponds with the principles of the 12 point program which have been urged by the American Medical Association for some years. Such legislation is in accord with the basic principles of freedom of choice of physician and hospital, and absence of interference in the personal relationship between doctor and patient. Apparently many legislators, who represent great numbers of American citizens, are aware of the importance of maintaining these principles. Several other measures in relationship to these same principles are, it is understood, to be introduced to the Congress. No doubt, public hearings will be heard on all of these measures and all of them will come before the House of Delegates at its next session, so that the House of Delegates may establish the policy of the American Medical Association on new measures concerning extension of medical care. Senator Hill has also been quoted as preferring to build on the system already prevailing rather than destroying our civilization to experiment with a new one. The measure proposed by Senator Hill apparently would require some clarification, and there should be definite assurances as to the extent of necessary regulations in making the measure, if passed, effective.

MEDICAL SERVICE AREAS IN THE UNITED STATES

Elsewhere in this issue is a progress report on the study of medical service areas begun more than two years ago by the Bureau of Medical Economic Research of the American Medical Association. The objective is to map the areas in which patients reside who are served by physicians in the principal towns and cities in the United States. Now that the areas have been established, the number of persons per physician in each area can be determined and the resulting population-physician ratios will provide some indication of the distribution of physicians. Traditionally this ratio has been established for counties and states. In this era of rapid transportation many of the patients seen by a physician in any one year actually reside outside the physician's own county. The map accompanying this progress report shows 757 areas of many shapes and sizes; this is an average of four counties per area. Of these 757 areas, 212 are interstate and 545 are intrastate; physicians and patients frequently cross state lines to give or receive medical care. There are 1,090 primary medical service centers, of which 87 are classified as prime-primary centers. This latter designation means that each of these 87 cities offers every type of medical treatment and surgery. The primary medical service centers are cities and towns which, relative to the nearby towns and villages, are primary sources of medical care. All these numbers are, of course, subject to revision before the book manuscript is completed—probably late in 1949. The attention of the student of marketing problems is drawn to this study by specific statements in the progress report. There are more areas and more centers than recent general trading area studies have established. The ways in which the people secure medical service are quite similar to their general trading habits but medical purchase is more localized. During these two years much assistance has been given the Bureau of Medical Economic Research by the secretaries, both elected and executive, of the state and county medical societies. This is an informed opinion, nonstatistical type of survey. When the study is finally completed, accurate information should be available for the first time regarding the supply and distribution of physicians throughout the country. Even this preliminary report should be sufficient evidence to convince many that the number of persons per physician in any county is a meaningless figure. Few of the boundary lines of the 757 medical service areas on the map coincide with the boundaries of counties; henceforth citation of population-physician ratios by counties and enumerations of counties without physicians should be abandoned.

ORGANIZATION SECTION

Washington Letter

(From a Special Correspondent)

April 4, 1949.

New Health Bills Emphasize Voluntary Participation

During the last week of March, new bills were introduced in both House and Senate calling for federal support of voluntary health insurance plans and of medical education, but on a voluntary rather than a compulsory basis. Principal attention was focused on the bipartisan bill (S.1456), cosponsored by Senators Hill, O'Conor, Withers, Aiken and Morse, which is designed to broaden coverage by existing prepayment medical and hospital care plans. Another major bill, S.1453, has for its purpose the alleviation of the shortage of physicians, dentists and allied professional personnel by subsidizing their training institutions and providing for scholarships. Its sponsors are Senators Pepper, Murray, Humphrey and Neely. A few days earlier Rep. W. M. Wheeler, (Democrat, Georgia) introduced in the House H.R. 3828, which would authorize federal loans to professional schools and their students.

Further along on the legislative path toward enactment is another national health measure, S.1411, which was reported favorably to the Senate on March 25 by the Labor and Public Welfare Committee. Also a bipartisan bill, sponsored by fourteen Democratic and Republican Senators, S.1411 provides for federal assistance to the states in support of preventive, diagnostic and therapeutic services for school children between the ages of 5 and 17. It is scheduled for final consideration on the Senate floor early in April and, if passed, will then go to the House for action.

Strongly urging favorable action on the Voluntary Health Insurance Act (S.1456) introduced by Senator Hill, three other Senators and himself, Senator Herbert O'Conor, Maryland Democrat, stated: "Objection is found to any proposals that would seek to regiment either the prospective recipients of these services, or the members of the medical profession who would be called upon to provide them. In [this] bill, I believe that the high objectives of any national medical care program can be achieved without disturbing, and in fact, with actual strengthening of, the satisfactory procedures in the field of health which have been established and perfected during the past. . . . I am convinced, and leading members of the medical profession in my own State with whom I consulted believe that the method of approach used in the proposed legislation is sound. We feel that it offers possibilities for development into a complete program which would answer all needs and yet maintain the present healthy relationship between the patient and members of the medical profession, while at the same time making possible desired extension of the services in question without entailing exorbitant outlays by the Federal government." (See condensation—Page 1007.)

The Pepper-Murray-Humphrey-Neely bill is applicable to training of physicians, dentists, nurses, sanitary engineers and dental hygienists. It provides for outright grants to schools, in proportion to the size of enrolment, as well as grants for improvement of physical facilities and equipment, and scholarships. The Wheeler bill authorizes loans rather than grants and covers schools of medicine, dentistry and osteopathy.

Public Health Service Budget of $165,674,000

Health consciousness of members of Congress, with particular reference to heart disease, cancer and mental illness, was demonstrated anew March 9 when the House passed, without dissent or amendment, a record $165,674,000 budget for the United States Public Health Service for the fiscal year beginning July 1, 1949. The sum is $964,060 above the present year's appropriation, and, in addition, $100,825,000 was approved for contract authorization, chiefly for aid to the states in furtherance of the Hill-Burton hospital act.

Most drastically slashed by the House was the allocation for general assistance to the states to conduct public health demonstrations, promote industrial hygiene investigations and perform miscellaneous functions in preventive medicine. The Bureau of the Budget recommended $24,408,000 for this purpose, but this figure was cut to $13,600,000 by the House. On the other hand, $11,387,000 was voted for the federal mental health program (including grants to states and research grants to institutions), compared with $10,562,000 recommended by the Budget Bureau. Similarly, the House allowed $16,400,000 for the cancer program—$300,000 above the figure recommended—and almost doubled the sum for heart. The Budget Bureau had approved $4,000,000 in appropriations for this program, but $7,725,000 was provided in the bill as it passed the House and was sent to the Senate for action. In addition, the House—on its own initiative—granted $2,000,000 in contract authority for construction of heart research facilities; $500,000 for subsidization of teaching, and $500,000 for traineeships in institutions. Contract authorization for research was pegged at $630,000 by the Budget Bureau, but that figure was raised to $1,200,000.

During the protracted Appropriations Committee hearings which preceded presentation and adoption of the Federal Security Agency budget, of which the Public Health Service estimates are a part, numerous medical practitioners, researchers and administrators testified in support of the federal cancer, heart and mental health programs. Among them were Drs. P. B. Cornely, Carl O. Flagstad, Tinsley R. Harrison, A. C. Ivy, T. Duckett Jones, William C. Menninger, Cornelius P. Rhoads, George S. Stevenson and S. B. Wortis.

Secretary of Defense Johnson Indorses Campaign

One of the first official acts of Louis Johnson, following his succession of James Forrestal as Secretary of Defense, was to affirm his support of the medical-dental procurement campaign and reiterate the acute shortage facing the Army and Navy unless there are more volunteers. He disclosed that telegraphic inquiries had been received from 1,600 former A.S.T.P. and V-12 students, but only 150—physicians and dentists combined—had applied for commissions and assignment to active duty.

To expedite action, Secretary Johnson said that he is sending to county medical and dental societies the names of more than 13,000 prospective candidates who either did not reply to Forrestal's letter or whose answers were negative. The county societies are being asked to get in touch with these men personally "to determine if and when they will be available for duty with one of the armed forces." A written report is requested on each of the persons concerned. Secretary Johnson added that he will write personal letters to hospital administrators, asking them to bring the military's medical officer shortage to the attention of former A.S.T.P. and V-12 students on their staffs and who are not war veterans.

Federal Trade Commission Cites "Becker's Pills"

The Federal Trade Commission has ordered Adolfo Enrique Besosa, of New York City, trading as A. E. Besosa Co. and Becker Medicine Co., to stop representing that "Becker's Pills" have any curative effect in treatment of renal conditions. Charging that the product's advertising is false and misleading, the Federal Trade Commission stated that the pills "have no beneficial effects in counteracting or offsetting damage to the kidneys resulting from the excessive use of alcohol or resulting from any other cause." Besosa was directed to make it clear in any future advertisements that the juniper oil contained in "Becker's Pills" is a renal irritant which may dangerously aggravate an incipient pathologic condition. Also, that the drugs digitalis and squill, which the pills contain, tend to accumulate in the body and their use over a period of time may result in serious injury to heart and circulatory system.

FEDERAL VOLUNTARY HEALTH INSURANCE BILL

A Condensation Prepared by the Bureau of Legal Medicine and Legislation, American Medical Association, April 1, 1949

On March 30 there was presented to the Senate a bill, S. 1456, sponsored by Senator Hill, Alabama; Senator O'Conor, Maryland; Senator Withers, Kentucky; Senator Aiken, Vermont, and Senator Morse, Oregon, to authorize grants to enable states to survey, coordinate, supplement and strengthen their existing health resources so that hospital and medical care may be obtained by all persons. It was referred to the Senate Committee on Labor and Public Welfare.

Major Objective

While this bill seeks other ends, its major objective is, as explained by Senator Hill, to provide protection for persons of limited income by giving them service cards in voluntary prepayment plans which will entitle them to the same kind of medical and hospital care as those who are able to purchase such protection on a voluntary basis.

Determination of Eligibility for Benefits

A state plan must provide methods of determining the eligibility of persons to receive service cards which will entitle them to benefits, in accordance with regulations prescribed by the Surgeon General of the Public Health Service. Within six months after the enactment of the legislation, the Surgeon General, with the approval of the Federal Hospital and Medical Care Council and the Administrator of the Federal Security Agency, must prescribe by general regulation the general manner in which the state agency shall determine the eligibility of persons unable to pay subscription charges for medical and hospital care. The determination of eligibility must be made, so far as possible, in advance of the need for medical and hospital care.

Method of Qualifying for Benefits

A state in its plan must provide for the issuance from time to time by the appropriate agency or agencies designated by the state of service cards of participating nonprofit prepayment plans for medical and hospital care to all persons who are certified as unable to pay all or part of the subscription charges of prepayment plans for such care, whether or not in immediate need of care, which will entitle such persons to needed hospital and medical care.

Benefits to be Provided

Such types of medical and hospital care are to be furnished to holders of service cards as may be required by general regulations prescribed by the Surgeon General with the approval of the Federal Council and the Administrator of the Federal Security Agency. This provision is qualified by the definition of the term "hospital and medical care" contained in the bill which declares it to mean surgical, obstetric and medical services, furnished in a hospital, and hospital services incident thereto not in excess of sixty days in any year, and including diagnostic and outpatient clinic services furnished in a hospital or in a diagnostic clinic. The term "hospital" is defined, incidentally, to include a diagnostic clinic.

Method of Payment for Benefits

A state plan must provide for satisfactory contracts or arrangements so that following the admission of each person having a service card to a hospital the nonprofit prepayment plan will accept liability for payment of all essential services in the same manner as in the case of its regular subscribers, and that payments for such medical and hospital care by the plan will be on a basis mutually agreeable to participating physicians and hospitals and the state agency or regional authority concerned. Nonprofit prepayment plans will be reimbursed by the state agency for the full amount of the payments thus made plus such reasonable administrative expenses as may be mutually agreed on.

Administration

The Surgeon General will administer the provisions of the bill on the federal level with the aid of a Federal Hospital and Medical Care Council of which he is to be chairman. Of the other ten members, to be appointed by the Administrator of the Federal Security Agency, four are to be persons who are outstanding in fields pertaining to medical and hospital care, two of whom are to be doctors of medicine and two hospital administrators; two members will be persons experienced in the administration of voluntary prepayment plans for medical and hospital care, and four will represent the consumers of medical and hospital care who are familiar with the need for medical and hospital care in rural or urban areas. The Surgeon General will be authorized to make such administrative regulations and *perform such other functions as he finds necessary to carry out* the provisions of the program.

On a state level, the bill provides that a state plan must designate a single state agency as the sole administrative agency and must give assurance that that agency will have authority to carry out the plan. The state administrative agency, the bill suggests, may be the same agency designated to administer the provisions of the Hospital Survey and Construction Act. A state plan must provide for a Hospital and Medical Care Authority within each of the regions into which the state has been or will be divided under the Hospital Survey and Construction Act, or by other means. Such Authority, composed of persons within the region, must include representatives of nongovernment organizations or groups, of state and local agencies, concerned with the utilization of hospitals, including representatives of medical associations, hospital associations, voluntary prepayment plans for medical and hospital care and representatives of the consumers of medical and hospital care who are *familiar with the need for such care in urban or rural areas.*

A state plan must also provide for the designation of a State Hospital and Medical Care Council. The head of the state administrative agency will serve as chairman of the Council and the other ten members must at the time of appointment be members of the regional Authorities and must possess qualifications identical with those required to be possessed by members of the federal Council. Presumably the state Council as well as the regional Authorities will advise the state administrative agency with respect to the administration of the program.

Surveys

A state plan must contain provisions for four surveys. One is to be made of existing diagnostic facilities and a program must be submitted for providing additional necessary diagnostic services and for making them available to all persons in the state. A second relates to existing facilities, services and financing for the care of mental, tuberculous, chronic disease and other patients hospitalized for long periods, and here again a program must be submitted for providing any needed additional facilities. A third survey must be made of areas in the state which are unable to attract practicing physicians and a recommendation must be made of methods for encouraging physicians to locate in such needy areas. The fourth survey will be of existing enrolment in participating voluntary prepayment plans and a plan must be developed for stimulating and encouraging enrolment in such plans by all persons able to pay subscription charges, with emphasis on employer participation and on enrolment of persons in rural areas.

Payroll Deductions

A plan must provide for payroll deductions of subscription charges of voluntary prepayment plans for medical and hospital care *for each employee, and his dependents,* of state or political subdivisions who request such deduction. Another section of the bill provides for a similar payroll deduction, on request, for officers and employees of the United States, including members of the armed forces.

State Plans in General

A state desiring to participate in this program must submit a plan for the approval of the Surgeon General. It must provide, in addition to the provisions previously mentioned, that it must be in effect in all political subdivisions of the state and, if administered by them, be mandatory upon them. It must provide, too, for over-all financial participation by the state in a total amount at least equal to 50 per cent of that portion of the total amount expended under the state plan during any quarter, exclusive of the amount allotted by the federal government. This provision seems to imply that a part of state funds will be contributed by its political subdivisions. Assurance must be given, too, that federal funds allotted will be used to supplement total payments made by the state and its political subdivisions and not as a substitute for such payments.

The methods of administration of a state plan, including methods relating to the establishment and maintenance of personnel standards on a merit basis, must comply with such regulations as the Surgeon General may prescribe, except that the Surgeon General will exercise no authority with respect to the selection, tenure of office or compensation of any person employed in accordance with such methods. Reports must be made to the Surgeon General from time to time. Safeguards must be established which restrict the use or disclosure of information concerning recipients to purposes directly connected with the administration of medical and hospital care under the state plan. A state plan must provide that a person receiving benefits shall not be identified as a person accepting assistance at the time of receiving care and that the person shall not be provided a separate grade or classification of care because of his accepting assistance. A regional Hospital and Medical Care Authority must encourage coordination of all health facilities and services in the region, both voluntary and government, and must recommend means for their effective utilization in making medical and hospital care available to all persons in the region.

If any person drawing unemployment compensation is enrolled in a participating voluntary prepayment plan for medical and hospital care, the state plan must provide that pro rata subscription charges in such plan for such person and his dependents shall be paid, out of funds available for medical and hospital care, for the time during which any such person is in receipt of unemployment compensation, such payment of subscription charges to be by way of direct payment to the plan either for the period of unemployment or, if subscription charges have been paid in advance, by way of extension of the period of protection of the plan for the period of unemployment, as may be prescribed by state law. And, finally, the state agency must from time to time review the state plan and submit to the Surgeon General any modification which it considers necessary.

If a state plan complies with the specifications contained in the bill it must be approved by the Surgeon General. If disapproved, the state agency, on request, may be afforded an opportunity for hearing before the Federal Hospital and Medical Care Council.

Veterans

The bill provides that nothing in it shall modify obligations assumed by the federal government under other statutes for the medical and hospital care of veterans or other presently authorized recipients of medical and hospital care under federal programs.

Payment to States and Financing

Federal appropriations will be authorized for such sums as may be necessary. From such sums there will be paid to each state with an approved plan an amount, which shall be used exclusively for medical and hospital care to persons unable to pay subscription charges, equal to the federal percentage of the total sums expended or estimated to be expended during a quarter under the state plan. In addition, an amount will be paid to the state equal to one half of the total of the sums expended for the proper and efficient administration of the state plan, as determined by the Surgeon General.

An estimate will be made by the Surgeon General of the amount to be paid to the state for each quarter. This estimate will be based on a report filed by the state containing its own estimate of the total sum to be expended. This report must state the amount appropriated or made available by the state and by its political subdivisions for expenditures in the quarter. If such amount is less than the state's proportionate share of the total sum of the estimated expenditures, the source or sources from which the difference is expected to be derived must be stated. The Surgeon General also will base his estimate on records showing the number of persons in the state unable to pay subscription charges.

The federal percentage for any state will be 100 per cent less that percentage which bears the same ratio to 50 per cent as the per capita income of the state bears to the per capita income of the continental United States, excluding Alaska. The federal percentage will, however, in no case be more than 75 per cent or less than 33½ per cent. For Alaska and Hawaii, the federal percentage will be 50 per cent. For Puerto Rico, the federal percentage will be 75 per cent.

State Control Assured

Except as otherwise specifically provided, the bill declares that nothing in it shall be construed as conferring on any federal officer or employee the right to exercise any supervision or control over the administration, personnel, maintenance or operation "of any hospital utilized for furnishing hospital and medical care" pursuant to the provisions of the title.

Miscellaneous General Regulations

The Surgeon General, with the approval of the Federal Council and the Administrator of the Federal Security Agency will be authorized to prescribe general regulations dealing with general standards for participation in this program of voluntary prepayment plans for medical and hospital care, general standards for participation of nonprofit prepayment plans, the general manner in which the state agency shall stimulate and assist in enrolling the population in voluntary prepayment plans for hospital and medical care, and general methods of administration of the state plan by the designated state agency, subject to the restriction previously noted.

Sponsors Express Points of View on Bill

At the time this bill was introduced, Senator Hill, Senator Aiken and Senator O'Conor spoke in favor of it. Senator Hill in a mimeographed release said in part as follows:

"The Voluntary Health Insurance Bill we are introducing today will perform the same service for financing hospital and medical care that the Hill-Burton Hospital Survey and Construction Act is now doing in the building of new hospitals.

"We know that much remains to be done, but already the Federal government has acted in many ways to meet its responsibilities for improving and safeguarding the health of our people. We have done much to promote research. We are assisting in the construction of hospitals and health centers. We recognize that Federal aid is necessary in the education of doctors and nurses. I have introduced in this Congress, on behalf of myself and some of my colleagues, a bill to assist in the expansion and improvement of local public health units.

"But for more than ten years we have not been able to agree on the best method of financing hospital and medical care to the individual.

"We have had extensive hearings on a compulsory health insurance program and discussions both in and out of Congress. We have had many proposals and blue prints and 'cures' suggested for the establishment of a completely new system of financing hospital and medical care for our people.

"But a compulsory system of health insurance carries within it the danger of uprooting and destroying the entire system of medical practice in this country.

"We believe that the present system of medical care has been too valuable, too effective and too useful through the years, to throw it aside for a new system which might not work. We believe it is the course of wisdom first to examine our existing health and hospital and medical resources, then to proceed with the building and strengthening of them where that is necessary to bring adequate health care to all the people.

"The last thing we want in this country is an abundance of poor hospitals and poor medical care. Our existing system has produced a quality of care which is the equal of any that has been developed anywhere in the world. The reason it has grown—and continues to grow—is that it has grown naturally. You cannot build a tree. Our problem is to take our existing system and continue to make it bigger and better."

. . . .

"The fact is that while we have been debating the pros and cons of a complete new system of Federal compulsory health insurance, the voluntary agencies already in the field have gone quietly ahead to provide protection against the costs of hospital and medical care to nearly a third of our population. In 1939 when the first compulsory health insurance bill was introduced, the Blue Cross plans for hospital care had only 3,000,000 people enrolled. Today they protect more than 33,000,000. The Blue Shield plans for medical care have enrolled about 10,000,000. And commercial insurance companies have enrolled considerable numbers. A recent survey shows that on December 31, 1947, an estimated 52,584,000 individuals were protected by voluntary hospital expense coverage; 26,247,000 individuals had voluntary surgical expense coverage; nearly 9 million had medical expense coverage; and an estimated total of 31,224,000 of our 58 million employed civilians were insured under some form of voluntary protection against loss of income due to sickness or accident.

"Here is a voluntary movement which cannot be ignored if we believe there is a logical place in our American way of life for the voluntary system."

Coming Medical Meetings

Alabama, Medical Association of the State of, Montgomery, April 19-21. Dr. Douglas L. Cannon, 519 Dexter Ave., Montgomery 4, Secretary.

American Association of Anatomists, Philadelphia, April 13-15. Dr. Normand L. Hoerr, 2109 Adelbert Road, Cleveland 6, Secretary.

American Association of Genito-Urinary Surgeons, White Sulphur Springs, W. Va., Greenbrier Hotel, May 9-11. Dr. Norris J. Heckel, 122 S. Michigan Ave., Chicago 3, Secretary.

American Association of Pathologists and Bacteriologists, Boston, April 15-16. Dr. Howard T. Karsner, 2085 Adelbert Road, Cleveland, Secretary.

American Association of the History of Medicine, Lexington, Ky., May 23-24. Dr. Benjamin Spector, 416 Huntington Ave., Boston 15, Secretary.

American Association on Mental Deficiency, New Orleans, Hotel Roosevelt, April 27-30. Dr. Neil A. Dayton, Box 51, Mansfield Depot, Conn., Secretary.

American Broncho-Esophagological Association, Chicago, Drake Hotel, April 18-19. Dr. Edwin N. Broyles, 1100 N. Charles St., Baltimore 1, Secretary.

American College of Allergists, Chicago, April 14-17. Dr. Fred W. Wittich, 423 LaSalle Medical Bldg., Minneapolis 2, Secretary.

American Dermatological Association, Hot Springs, Va., May 23-26. Dr. Louis A. Brunsting, 102 Second Ave. S.W., Rochester, Minn. Secretary.

American Gastro-Enterological Association, Atlantic City, Claridge Hotel, June 3-4. Dr. Dwight L. Wilbur, 655 Sutter Street, San Francisco 2, Secretary.

American Goiter Association, Madison, Wis., Hotel Loraine, May 26-28. Dr. Thomas C. Davison, 478 Peachtree St., N.E., Atlanta 3, Ga., Secretary.

American Laryngological Association, New York, May 16-17. Dr. Louis H. Clerf, 1530 Locust St., Philadelphia, Secretary

American Laryngological, Rhinological and Otological Society, Chicago, Drake Hotel, April 18-20. Dr. C. Stewart Nash, 277 Alexander St., Rochester 7, New York, Secretary.

American Ophthalmological Society, Hot Springs, Va., The Homestead, June 2-4. Dr. Maynard C. Wheeler, 30 W. 59th St., New York, Secretary.

American Orthopedic Association, Colorado Springs, May 18-21. Dr. C. Leslie Mitchell, Henry Ford Hospital, Detroit 2, Secretary.

American Otological Society, New York, May 18-19. Dr .Gordon D. Hoople, 713 E. Genesee St., Syracuse, N. Y., Secretary.

American Pediatric Society, Atlantic City, May 5-6. Dr. Henry G. Poncher, 1819 W. Polk St., Chicago 12, Secretary.

American Physiological Society, Detroit, April 19-22. Dr. Milton O. Lee, 2101 Constitution Ave., Washington 25, D C., Executive Secretary

American Proctologic Society, Columbus, Ohio, May 31-June 4. Dr. W. Wendell Green, 1838 Parkwood Ave., Toledo 2, Ohio, Secretary.

American Psychiatric Association, Montreal, Canada, May 23-27. Dr. Leo H. Bartemeier, General Motors Bldg., Detroit 2, Secretary.

American Society for Clinical Investigation, Atlantic City, May 2. Dr. Paul B. Beeson, Grady Hospital, Atlanta 3, Georgia, Secretary.

American Society for Experimental Pathology, Detroit, April 18-22. Dr. Frieda S. Robscheit-Robbins, 260 Crittenden Blvd., Rochester, N. Y., Secretary.

American Society for Pharmacology and Experimental Therapeutics, Detroit, April 18-22. Dr. Harvey B. Haag, Medical College of Virginia, Richmond 19, Secretary.

American Society for Research in Psychomatic Problems, Atlantic City, Chalfonte-Haddon Hall, April 30-May 1. Dr. Sydney G. Margolis, 714 Madison Ave., New York 24, Executive Secretary.

American Society of Biological Chemists, Detroit, April 17-22. Dr. Otto A. Bessey, 1853 W. Polk St., Chicago 12, Secretary.

American Surgical Association, St. Louis, April 20-22. Dr. Nathan Womack, University of Iowa, Iowa City, Secretary.

American Urological Association, Los Angeles, Hotel Biltmore, May *16-19. Dr. Thomas D. Moore, 899 Madison Ave., Memphis 3, Tenn.*, Secretary.

Arizona State Medical Association, Tucson, May 8-10. Dr. Frank J. Milloy, 15 E. Monroe St., Phoenix, Secretary.

Arkansas Medical Society, Little Rock, April 14-16. Dr. William R. Brooksher, 602 Garrison Ave., Fort Smith, Secretary.

Association for the Study of Internal Secretions, Atlantic City, June 3-4. Dr. Henry H. Turner, 1200 N. Walker St., Oklahoma City 3, Secretary.

Association of American Physicians, Atlantic City, May 3-4. Dr. Henry M. Thomas Jr., 1201 N. Calvert St., Baltimore 2, Secretary.

California Medical Association, Los Angeles, May 8-11. Dr. L. Henry Garland, 450 Sutter St., San Francisco 8, Secretary.

Connecticut State Medical Society, New Britain, State Teachers' College, May 3-5. Dr. Creighton Barker, 258 Church St., New Haven, Secretary.

Federation of American Societies for Experimental Biology, Detroit, April 18-22. Dr. Milton O. Lee, 2101 Constitution Ave., Washington 25, D. C., Secretary.

Florida Medical Association, Belleair, April 10-13. Dr. Robert B. McIver, 111 West Adams St., Jacksonville, Secretary.

Georgia, Medical Association of, Savannah, Hotel De Soto, May 10-13. Dr. Edgar D. Shanks, 478 Peachtree St., N.E., Atlanta, Secretary.

Hawaii Territorial Medical Association, Honolulu, May 5-8. Dr. Harry L. Arnold Jr., 510 S. Beretania St., Honolulu, Secretary.

Illinois State Medical Society, Chicago, Palmer House, May 16-18. Dr. Harold M. Camp, 224 S. Main St., Monmouth, Secretary.

International Congress *on Rheumatic Diseases, New York, Hotel Waldorf-Astoria*, May 30-June 3. Dr. Philip S. Hench, Mayo Clinic, Rochester, Minn., Chairman, American Committee.

Io[illegible] Des Moines, April 18-21. Dr. Allan B. [illegible]'s Moines 9, Secretary.

Ka[illegible]a, May 9-12. Dr. D. D. Vermillion, 512 [illegible] Secretary.

Louisiana State Medical Society, New Orleans, May 5-7. Dr. P. T. Talbot, 1430 Tulane Avenue, New Orleans 13, Secretary.

Maryland, Medical and Chirurgical Faculty of the State of, Baltimore, April 26-27. Dr. George H. Yeager, 1211 Cathedral St., Baltimore 1, Secretary.

Massachusetts Medical Society, Worcester, May 24-27. Dr. H. Quimby Gallupe, 8 Fenway, Boston 15, Secretary.

Medical Library Association, Galveston, Texas, April 10-14. Miss Mildred R. Crowe, Medical College of Alabama Library, Birmingham 5, Ala., Secretary.

Minnesota State Medical Association, St. Paul, Municipal Auditorium, May 9-11. Dr. B. B. Souster, 496 Lowry Medical Arts Bldg., St. Paul 2, Secretary.

Mississippi State Medical Association, Biloxi, May 10-12. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.

National Tuberculosis Association, Detroit, May 2-6. Dr. H. Stuart Willis, 1790 Broadway, New York 19, Secretary.

Nebraska State Medical Association, Omaha, Hotel Paxton, May 2-5. Dr. R. B. Adams, 1315 Sharp Building, Lincoln 8, Nebraska, Secretary.

New Jersey, Medical Society of, Atlantic City, Hotel Ambassador, April 25-28. Dr. Earl L. Wood, 315 W. State St., Trenton 8, Secretary.

New Mexico Medical Society, Roswell, May 5-7. Dr. H. L. January, 221 W. Central Ave., Albuquerque, Secretary.

New York, Medical Society of the State of, Buffalo, Hotel Statler, May 2-6. Dr. Walter P. Anderton, 292 Madison Ave., New York 17, Secretary.

North Carolina, Medical Society of the State of, Pinehurst, The Carolina, May 9-11. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.

North Dakota State Medical Association, Minot, May 14-17. Dr. O. A. Sedlak, 702 First Ave. S., Fargo, Secretary.

Ohio State Medical Association, Columbus, April 19-21. Mr. Charles S. Nelson, 79 E. State St., Columbus 15, Executive Secretary.

Oklahoma State Medical Association, Tulsa, Mayo Hotel, May 15-19. Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Secretary.

Rhode Island Medical Society, Providence, May 11-12. Dr. Morgan Cutts, 106 Francis St., Providence 3, Secretary.

Society of American Bacteriologists, Cincinnati, May 15-20. Dr. John Blair, Hospital For Joint Diseases, New York, Secretary.

South Dakota State Medical Association, Yankton, May 22-24. Dr. Roland G. Mayer, 22½ S. Main St., Aberdeen, Secretary.

Southeastern Surgical Congress, Biloxi, Miss., May 23-26. Dr. Benjamin T. Beasley, 45 Edgewood Ave. S.E., Atlanta 3, Ga., Secretary.

Southern Branch, American Public Health Association, Dallas, Texas, Baker Hotel, April 14-16. Dr. George A. Denison, 600 S. Twentieth St., Birmingham, Ala., Secretary.

Tennessee State Medical Association, Chattanooga, April 12-14. Dr. W. M. Hardy, 706 Church Street, Nashville 3, Secretary.

Texas, State Medical Association of, San Antonio, May 2-5. Dr. Harold Williams, 700 Guadalupe St., Austin, Secretary.

Western Association of Industrial Physicians and Surgeons, Los Angeles, Hotel Biltmore, May 7. Dr. Christopher Leggo, Crockett, Calif., Secretary.

Western Branch of American Public Health Associaiton, Los Angeles, Hotel Biltmore, May 30-June 1. Mr. Walter S. Mangold, University of California, Berkeley, Calif., Secretary.

Medical Legislation

STATE LEGISLATION

California

Bill Introduced.—A. 3099 proposes that the required physical **examination of school teachers** shall include an x-ray of the lungs and a skin test recognized by the American Medical Association.

Colorado

Bill Introduced.—S. 614 proposes enabling legislation for the incorporation of **nonprofit** hospital and **medical and surgical care plan** corporations.

Idaho

Bill Enacted.—H. 290 has become chapter 208 of the Laws of 1949. It authorizes county boards to levy a special tax to be used solely and exclusively for **preventive health services.**

Michigan

Bills Introduced.—S. Con. Res. 19 proposees to memorialize the Congress of the United States not to adopt ***legislation relative to socialized medicine.*** S. 101, to amend the workmen's compensation act, proposes to include **dental care** to injured employees when necessary. S. 192 proposes to extend the benefits of the **privileged communications** statute to physicians and their patients.

Missouri

Bill Introduced.—*H. 226 proposes the creation of a* ***naturopathic examining board*** and defines naturopathy as that science, art or system of diagnosis and treatment of diseases and prevention of human ailments through the use of natural and physical agents.

Oklahoma

Bill Introduced.—S. 211 proposes to require institutions requiring for the effective carrying on of its scientific or educational activities the **use of live dogs and cats** to apply to the state board of health for a license to obtain animals from dog pounds.

Washington

Bills Enacted.—A simple House resolution was enacted March 10, 1949 which resolved that the **President of the United States be commended** for his courageous fight in behalf of the health of the people of the country. H. 329 has become chapter 204 of the Laws of 1949. It makes it an act of **unprofessional conduct** for any person licensed to practice medicine and surgery, drugless treatment in any form, or dentistry to accept any **rebate, refund, commission** or unearned discount whether in the form of money or otherwise as compensation for referring patients to any person, firm, corporation or association.

GOVERNMENT SERVICES

ARMY

MEDICAL SERVICE CORPS

In the presence of eminent members of scientific societies, Lieut. Col. Charles S. Gersoni and Majors Raymond J. Karpen and John V. Painter were sworn in March 13 as the first appointed Assistant Chiefs of the Medical Service Corps. In addition to Col. Othmar F. Goriup, Chief of the Corps, and other executives of the Surgeon General's Office, the following were present: Col. Michael J. Blew, M.S.C., Reserve; Francis B. Elder, engineering associate, American Public Health Association; Robert Fischelis, secretary, American Pharmaceutical Association; Ernest Little, president, American Pharmaceutical Association; Norman Loffer, president, American Society of Professional Biologists; F. A. Moulton, of the American Association for the Advancement of Science; Leland Parr, executive secretary, American Bacteriological Association; Paul Robbins, executive secretary, National Society of Professional Engineers; Joseph F. Sadusk, executive director, Committee on Medical Sciences of the Research and Development Board; George E. Taylor, assistant secretary, American Chemical Society, and Dael Wolfle, executive secretary, American Psychological Association.

The new Assistant Chiefs will serve as respective chiefs of the three sections of the corps: Colonel Gersoni as Chief of the Medical Allied Sciences Section; Major Karpen as Chief of the Sanitary Engineering Section, and Major Painter as Chief of the Pharmacy, Administration and Supply Section.

The Medical Service Corps was established by the Eightieth Congress on Sept. 7, 1947. The corps consists of commissioned specialists in fields allied to medicine: aviation psychologists, bacteriologists, biochemists, clinical nutritionists, optometrists, parasitologists, pharmacists, physiologists, psychiatric social workers, psychophysiologists, sanitary engineers, serologists and toxicologists. Establishment of the corps was necessary to furnish these professional skills in order that the Army might continue to provide medical care equal to, or better than, the medical care of civilian life.

OFFICERS ACCEPTED FOR ADVANCED TRAINING

The following Medical Department officers have been accepted for advanced training by the civilian schools and hospitals indicated:

Name	Institution	Subject
Col. Charles L. Leedham	University of Pennsylvania, Philadelphia	Internal medicine
Col. Albert A. Biederman	Massachusetts General Hospital, Boston	Internal medicine
Capt. Edward J. Lorenze	Columbia University, New York	Physical medicine
First Lieut. James W. Mankin	Grady Memorial Hospital, Atlanta, Ga.	Residency in pathology
First Lieut. Joseph R. Newton	Salt Lake County General Hospital, Salt Lake City	Residency in pediatrics
First Lieut. Davis A. Baltz	Memorial Hospital, Wilmington, Del.	Residency in general surgery
First Lieut. Howard J. Brown	University Hospitals, Cleveland	Intern training
First Lieut. Paige B. Follo	University Hospital, Ann Arbor, Mich.	Residency in medicine
First Lieut. Charles B. Smith	Psychopathic Hospital, Iowa City, Iowa	Residency in psychiatry
First Lieut. Leonard W. Melander	Providence Hospital, Detroit	Intern training

CERTIFIED BY SPECIALTY BOARDS

The following colonels in the Regular Army Medical Corps have recently been certified by the American Specialty Boards indicated: Aubrey L. Bradford (internal medicine); Robert T. Gants (general surgery); William W. Nichols (general surgery), and Carl W. Tempel (internal medicine).

MALIGNANT MELANOMA

The Army Institute of Pathology, Washington, D. C., reports that there are now on hand for investigation about 23,000 enucleated eyes, including 2,000 with malignant melanoma, and more than 5,000 tumors of the urinary bladder. This material is available for study and statistical analysis.

NAVY

NOMINATED FOR POSTGRADUATE INSTRUCTION

The Surgeon General's office reports that the following Navy Medical officers have been nominated to receive postgraduate instruction: Comdr. Hubert L. Anderson, Lake Benton, Minn., residency in surgery at the Naval Hospital, Long Beach, Calif.; Comdr. Stephen J. Ryan, Providence, R. I., residency in ophthalmology at the Boston City Hospital, Boston; Lieut. (jg) Preston H. Bandy, Gallatin, Tenn., residency in anesthesiology at the Naval Hospital, Bethesda, Md.; Lieut. (jg) Jack C. Berger, Oak Park, Ill., residency in surgery at Presbyterian Hospital, Chicago; Lieut. (jg) Robert E. Dent, Bowling Green, Ky., residency in surgery at the Naval Hospital, St. Albans, N. Y., and Lieut. (jg) William G. Krech, Paterson, N. J., residency in surgery at the Naval Hospital, Chelsea, Mass.

ACTIVE SERVICE FOR RESERVE OFFICERS

The Naval Air Reserve Training Command offers medical officers in the Naval Reserve an opportunity to serve in an active duty status at Naval air stations located in Birmingham, Ala.; Columbus, Ohio; Denver; Grosse Ile, Mich.; Jacksonville, Fla.; Lincoln, Neb.; Niagara Falls, N. Y.; St. Louis, and Seattle.

In addition to the medical officer's base pay and allowance for subsistence and quarters, a remuneration of $100 per month will be paid to accepted applicants who agree to remain on active duty for a period of one year or longer. The advantages offered by this opportunity may particularly appeal to those who are awaiting residencies or who are undecided as to their future plans. Applications may be submitted specifying the date which the applicant desires to begin, as well as terminate, active duty; he may designate choice of duty stations in order of preference. Applications for periods of less than one year will receive the same consideration as those for longer periods. A letter addressed to Staff Medical Officer, Naval Air Reserve Training Command, Naval Air Station, Glenview, Ill., will bring full particulars without obligation.

PERSONALS

Commander Horace D. Warden, M.C., was recently assigned as medical officer to the Presidential Yacht *Williamsburg*. Dr. Warden is a graduate of the University of Montana and Rush Medical College, Chicago. During the recent war, he was awarded the Bronze Star and the Purple Heart, having been seriously wounded at Okinawa aboard the U. S. S. *Terror*, which was hit by a Japanese suicide plane.

Lieutenants (jg) DuWayne D. Gadd of Saginaw, Mich., and Tom N. Mullis of Los Angeles have been nominated for their first active duty in the Reserve Corps and will go to residencies in neurology and obstetrics and gynecology at the George F. Geisinger Memorial Hospital, Danville, Pa., and the Naval Hospital, Philadelphia, respectively.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

COLORADO

Postgraduate Course in Industrial Medicine.—A postgraduate course in industrial medicine will be given at the University of Colorado Medical Center, Denver, May 19-20, sponsored by the Colorado State Medical Society and the University of Colorado School of Medicine, Denver. The course will orient physicians to principles involved in the practice of industrial medicine. The program consists of didactic lectures and demonstrations to be conducted by members of the faculty and practicing physicians. Admission to this course is open to all physicians who are members of their constituent medical societies. Tuition will not be charged, but a registration fee of $10 is required of all applicants accepted. Inquiries should be directed to Frank Princi, M.D., director of the Division of Industrial Medicine, University of Colorado Medical Center, Denver.

ILLINOIS

Mental Health Week in Illinois.—State plans for Mental Health Week in Illinois April 24-30, part of a nationwide observance sponsored by the U. S. Junior Chamber of Commerce, are being made by the Mental Health Advisory Committee of the Illinois Department of Public Health. Included in the committee are representatives of the Illinois State Medical Society, Illinois Society for Mental Hygiene, Illinois Department of Public Welfare, the U. S. Public Health Service, Illinois Psychiatric Society and the Cook County Department of Public Health. Dr. Rudolph G. Novick, Chicago, is chairman of Mental Health Week in Illinois.

Chicago

Set Dates for Postgraduate Courses.—The Chicago Medical Society will present two postgraduate courses during the year at Thorne Hall, Northwestern University Medical School campus: Cardiorenal and Peripheral Vascular Diseases, October 17-22, and Obstetrics, Endocrine-Gynecology and Sterility, October 24-29.

Award Capps Prize.—The Institute of Medicine of Chicago announces that the annual Joseph A. Capps prize of $400 for medical research, founded by Dr. and Mrs. Edwin R. LeCount, has been awarded for 1948 to Dr. Hushang Javid, University of Illinois College of Medicine, 1946, for his study on a new technic for permanent pancreatic fistula.

Appointments at Loyola University.—Stritch School of Medicine of Loyola University has appointed Dr. George J. Rukstinat, attending pathologist at Cook County, Loretto and Holy Cross hospitals, as clinical professor of pathology, and Dr. Louis F. Plzak, chairman of the department of surgery at Loretto Hospital, as clinical assistant professor of surgery. Dr. Fred R. Zeiss of the Little Company of Mary Hospital was appointed clinical associate in the department of bone and joint surgery and Hugh J. McDonald, Sc.D., professor of physical chemistry and chairman of the department of biochemistry. Dr. McDonald has been professor of chemistry at the Illinois Institute of Technology.

Navajo Crippled Children Treated in Chicago.—Six Navajo crippled children from Arizona and New Mexico in need of specialized medical care and hospitalization will be treated this year at the Home for Destitute Crippled Children, which is affiliated with the University of Chicago Clinics. A mercy project undertaken by the home to alleviate the suffering of those with the most difficult and complicated cases among the more than 500 crippled Navajo children, the service is an extension of the home's current year's program for 24 Alaskan crippled children. Last April the Home for Destitute Crippled Children made provisions for 2 Alaskan children from the Division of Crippled Children of Alaska to be sent to Chicago each month .for surgical and medical attention. Fourteen Alaskan children have been sent to date, and 6 have been returned to their homes. The Home for Destitute Crippled Children's project will help to meet the emergency situation of the Navajo crippled children, according to M. M. Stewart, general superintendent of the Navajo service of the Office of Indian Affairs of the Department of Interior. Some crippled Indian children living in Arizona have been cared for through the Indian Service hospital at Phoenix, but the state does not provide care for Navajos under the crippled children's division of the social security program. Services available include those of orthopedic surgeons, other physicians and dentists, provided entirely by the University of Chicago, free of charge, a graduate nursing service, a social service department, occupational therapists, a bedside teaching service provided by the Board of Education, and complete operating room, roentgenologic and laboratory services obtained from their respective departments in the university clinics.

IOWA

Cerebral Palsy Clinics.—The Iowa Society for Crippled Children and Disabled will conduct consultant clinics at the Cerebral Palsy Demonstration School in Des Moines for any patient afflicted with this condition. The clinic will be private in character; patients will not be seen except with a physician's referral, and the child's own physician will be requested to attend the clinic. A follow-up report will be made on the diagnosis of each patient. Parent counseling for a home training program will be outlined in the treatment of each child. Fees will be charged on a sliding scale in accordance with the family's ability to pay. Physicians with patients suffering from cerebral palsy may secure from the Iowa Society for Crippled Children and Adults, 2917 Grant Avenue, Des Moines 12, information regarding clinical services now available.

KANSAS

Dr. Schafer to Head Department of Surgery.—Dr. Paul W. Schafer, associate professor of surgery since last July and member of the faculty, University of Kansas School of Medicine, Kansas City, has been appointed chairman of the department of surgery effective July 1, succeeding Dr. Thomas G. Orr, head of surgery since 1924. Dr. Orr will remain professor of surgery but will be relieved of administrative duties. Dr. Schafer, a graduate of Ohio State University College of Medicine, Columbus, 1939, came to the University of Kansas School of Medicine in 1946 from the University of Chicago Clinics, where he had been an instructor in surgery.

KENTUCKY

First Mobile Medical Clinic.—The Jefferson County Fiscal Court has presented to the Louisville-Jefferson County Board of Health the first mobile medical clinic in Kentucky, a 30 foot trailer fully equipped as a doctor's office. Its services include examinations, immunizations, child health work and other preventive measures which are being maintained for the residents of outlying areas of the county where regular scheduled routes will be followed. A physician, a registered nurse and a driver compose the trailer staff. During its first month of operation, the "doctormobile" brought medical service to 400 persons.

Personals.—The new state public welfare commissioner, Dr. Addie M. Lyon, Frankfort, who was formerly head of Central State Hospital at Lakeland, was honored at a dinner meeting of the Committee on Institutions of the Louisville Council of Churches held in Louisville February 8. The subject of Dr. Lyon's talk was "Contributions of Laymen to Hospital Work." ——Dr. Bruce Underwood, state health commissioner, Dr. Emmet F. Horine, Louisville heart specialist, and Dr. Charles A. Vance, Lexington, president, Kentucky State Medical Association, have accepted membership on a Subcommittee on Health, along with twelve other subcommittees, under the Committee for Kentucky, the purpose of which is to formulate plans for the future of the state.

MARYLAND

Premedical Course in Biophysics.—To meet the need for trained persons in the field of biophysics, Washington College at Chestertown is offering a course designed primarily for premedical and medical technology students. The course deals with medical physics in clinical and pathologic physiology and with biotechnology in engineering design.

Record Low Mortality Rates in 1948.—According to the Bureau of Vital Statistics, a record low mortality rate was established in 1948 for influenza, pneumonia, infancy and tuberculosis. Over a ten year period influenza and pneumonia dropped from a death rate of 82.7 per 100,000 to 34.4, a 58.4 per cent decrease. Infancy rates dropped from 55.3 per 1,000 live births to 29.4 representing a 46.8 per cent decrease, and tuberculosis declined from 74.7 per 100,000 to 45.3, a 39.3 per cent decrease. Maternal deaths maintained the all-time low record of 1947, 0.9 per 1,000 live births. It declined from 1938, when the maternal death rate was 3.5, undoubtedly because of the intensive work of the committee on maternal and child welfare of the Medical and Chirurgical Faculty of Maryland. In cooperation with the Bureau of Child Hygiene, the committee has investigated every maternal death since 1925 and has cooperated closely with physicians in the prevention of maternal mortality.

MASSACHUSETTS

Cutter Lecture on Preventive Medicine.—Dr. James C. Spence, professor of child health, University of Durham, England, will deliver the Cutter Lecture on Preventive Medicine May 11, 5 p. m., at the Harvard Medical School, Boston, on "Preventive Medicine: The Role of Parents in Child Health." The lectures have been held since 1912. The medical profession, medical and public health students and others interested are cordially invited to attend.

University Appointment.—Dr. Oliver Cope, visiting surgeon at the Massachusetts General Hospital, has been appointed associate professor of surgery at the Harvard Medical School, Boston. Dr. Cope is a graduate of Harvard, 1928, and has since then been associated with the teaching of surgery there. He is director of a contract research with the Office of Naval Research, U. S. Navy. Dr. Cope has served as consultant to the U. S. Army in Germany and in 1948 was lecturer at the Swiss-American Center for Medical Exchange and Information.

MICHIGAN

Scarlet Fever Rises Sharply.—Scarlet fever is spreading throughout the state at the rate of 450 cases a week or about three times the usual rate, according to Dr. Frederick S. Leeder, Lansing, director of the Division of Disease Control, Records and Statistics of the Michigan Department of Health.

Reorganize State Health Department.—The Michigan Department of Health has been reorganized from thirteen bureaus and three groups into a cabinet type of organization with six divisions and one administrative group. The Bureaus of Venereal Disease and Tuberculosis Control have been combined into one division and the Bureaus of Disease Control and Records and Statistics into another. The Bureaus of Laboratories, Industrial Health and Engineering all became separate divisions. A Division of Local Health Services has been formed by combining the former Bureaus of Local Health Services, Public Health Dentistry, Maternal and Child Health and Public Health Nursing. This combination was expected to make more efficient use of state health services through the correlation of those bureaus which primarily work with local health departments and also to draw the local health departments into a more closely knit over-all plan of health protection. The six division directors report directly to the commissioner.

The administrative group, responsible directly to the commissioner through an administrative assistant, is made up of the former Bureaus of Finance and Education, along with Personnel, Law Enforcement and Communications groups. Dr. Heustis, state health commissioner, said he expects the new organization to coordinate the work of the department better and make it possible to provide more and faster service. Provision for an administrative assistant, rather than a deputy, makes it possible to substitute a person not medically trained to relieve the commissioner of routine administrative matters. It also makes possible direct contact of the commissioner and division directors without any buffer. Regular staff conferences will include not only the division directors but also the section chiefs.

MINNESOTA

Special Lectures.—Dr. Elexious T. Bell, head of the department of pathology at the University of Minnesota Medical School, Minneapolis, delivered the annual Clarence M. Jackson Lecture, sponsored by the Phi Beta Pi Fraternity, March 2 on "Pathology of Diabetes." On March 3 the George Chase Christian Cancer Lecture was given by Dr. Ira T. Nathanson, Boston, on "Hormonal Alteration of Advanced Carcinoma of the Breast."

State Association Sponsors Medical Press Conference.—The Minnesota State Medical Association sponsored a statewide medical press conference at Minneapolis April 8 to acquaint newspaper editors of the state with the medical profession's views against compulsory sickness insurance. A panel of ten including physicians and laymen answered questions from newspapermen. Speakers at the dinner in the evening were Irving Pflaum, foreign editor of the *Chicago Sun-Times,* and John L. Bach, director of press relations of the American Medical Association, Chicago. The expected attendance was 600. All Minnesota editors were invited to attend, and a doctor from each community was invited to bring a guest editor to the conference.

MISSOURI

Final Health Forum.—The Greene County Health Forum will present Dr. Robert Mueller, St. Louis, past president of the Missouri State Medical Association, as guest speaker at the final meeting of the forum April 21 at Clara Thompson Hall, Springfield. His paper, dealing with recent advances in medicine, will be "You Should Live Longer!"

NEW YORK

Dr. Graham to Receive Roswell Park Medal.—The Buffalo Surgical Society has awarded the Roswell Park Medal to Dr. Evarts A. Graham, professor of surgery at Washington University School of Medicine, St. Louis, for outstanding surgical achievement. Dr. Graham will give the Roswell Park Lecture May 5 at the Kleinhans Music Hall, Buffalo, at 9 p. m.

Postgraduate Courses in Disease of Heart and Vascular System.—The University of Buffalo School of Medicine in conjunction with the New York State Department of Health and with the approval of the Western New York Chapter of the American Heart Association will present courses in Diseases of the Heart and Vascular System April 18-23 and April 25-30 in Buffalo. Identical courses will be given during each period. Registration will be limited to two physicians from the city of Buffalo and two from each of the following counties: Erie, Niagara, Genesee, Chautauqua, Cattaraugus and Wyoming. The fee of $50 and a fellowship allowance of $10 a day to each physician will be paid by the state department of health. The registration fee of $10 must accompany application to the school of medicine and will be returned on acceptance.

Cornell Medical Alumni Honor Dr. McCann.—Dr. William S. McCann, professor of medicine at the University of Rochester School of Medicine and Dentistry and physician in chief at Strong Memorial-Rochester Municipal Hospitals, received the first annual Award of Distinction given by the Cornell University Medical College Alumni "in recognition of his notable achievements in medical science and education, and for his dynamic influence in the art and practice of medicine." Dr. McCann is a member of the class of 1915. He has filled various hospital and teaching appointments, including Cornell and Johns Hopkins. He also held the Arthur Tracy Cabot Fellowship in surgery at Harvard and a research fellowship from the Russell Sage Institute of Pathology. In 1924 he was appointed to the Charles A. Dewey Professorship of Medicine at the University of Rochester and to the hospital positions he now holds. The award ceremony was a part of the Alumni Day program at the New York Hospital-Cornell Medical Center March 24.

New York City

Columbia Raises Fees.—The Columbia University College of Physicians and Surgeons and the School of Oral and Dental Surgery will raise their tuition fees this fall from $600 to $750 a year. The increase is said to be due to heavy costs in medical education.

Jones Lecture.—Dr. C. Howard Hatcher, Chicago, will deliver the annual Sir Robert Jones Lecture May 12 at 8:30 p. m. at the Hospital for Joint Diseases on "Results of Treatment of Bone Sarcoma." The lecture will be part of a three day orthopedic alumni conference of the hospital May 12-14. The Sir Robert Jones Lectureship was established by the hospital in 1930 in honor of the surgeon who is considered by many to be the father of modern orthopedic surgery.

Seminar on Otolaryngology and Ophthalmology.—The New York Polyclinic Medical School and Hospital will hold a seminar on otolaryngology and ophthalmology April 25-29. A review of recent advances in the diagnosis and treatment of the more common disorders in the fields of the two specialties will be given through lectures, motion pictures and demonstrations. Members of the staff and visiting speakers will participate. Out of town guest speakers will be Drs. Norton Canfield, New Haven, Conn., James E. Landis, Reading, Pa., and Romeo A. Luongo, Philadelphia.

Residency in Neoplastic Diseases of Childhood.—Memorial Hospital, New York, has established a residency in pediatrics. The period of service is for a minimum of six months, and its purpose is to train the pediatrician in the diagnosis and management of neoplastic diseases in childhood. The resident will also participate in the research program in progress at the Sloan-Kettering Institute. Three months' credit toward pediatric residency training requirements has been approved by the American Board of Pediatrics. For particulars applicants may communicate with the director, Pediatric Service, Memorial Hospital, 444 East 68th Street, New York 21.

NORTH CAROLINA

Cancer Clinic at Durham Hospital.—The Durham Cancer Detection Center, fourth of its kind in the state, was opened at Watts Hospital January 20. The center was established through the cooperation of the State Health Board and the North Carolina chapter of the American Cancer Society.

All Counties to Have Health Departments.—As of July 1 this year, every county in North Carolina will have an organized public health department, according to Dr. John W. R. Norton, Raleigh, state health officer. On January 1 ninety-six counties had full time public health departments, and the remaining four counties have since that time set up or made provisions for establishing full time departments.

Appointments to Bowman Gray School of Medicine.—Dr. Parker R. Beamer, Washington University Medical School, St. Louis, has been appointed professor of microbiology and immunology and associate professor of pathology at the Bowman Gray School of Medicine of Wake Forest College, Winston-Salem, effective July 1. Dr. Richard L. Masland has been promoted to associate professor of neuropsychiatry in charge of neurology, and J. Maxwell Little, Ph.D., to the position of professor of pharmacology and associate professor of physiology. Dr. Katherine H. Anderson is now assistant professor of clinical pediatrics and Dr. Elizabeth Conrad is instructor in clinical pediatrics.

OHIO

Training Course in Cardiovascular Research.—A twelve month training course in the disciplines of cariovascular research for a limited number of qualified persons will be offered at Western Reserve University School of Medicine, Cleveland, with the support both of the American Heart Association and the National Heart Institute, U. S. Public Health Service. If the enrolment warrants, the course will begin July 1; otherwise September 1. Graduates and undergraduates in medicine or related sciences who are highly recommended and acceptable to the director, Dr. Carl J. Wiggers, and candidates able to support themselves or on fellowship grants from foundations or institutes are eligible. There are no tuition fees. The Division of Research and Fellowships of the National Institutes of Health is prepared to offer research fellowships for this training to acceptable candidates who require financial support. Enrolment will be limited to ten. For details address Dr. C. J. Wiggers, director of the department of physiology, Western Reserve University School of Medicine, Cleveland.

PENNSYLVANIA

Public Lectures on Cancer.—The University of Scranton in cooperation with the Lackawanna County Unit of the American Cancer Society is presenting a series of free public lectures on cancer. Each week, it is reported, several hundred Scranton residents attend the evening lectures by medical and educational authorities. The program has become so popular that two local radio stations rebroadcast the lectures.

Appointed Director of Rheumatic Heart Division.—Dr. Mary L. Richardson, Philadelphia, has been appointed chief of the Rheumatic Heart Division, Pennsylvania Department of Health. Dr. Richardson, a graduate of the University of Colorado School of Medicine, Denver, has been on the staff of St. Christopher's Hospital for Children in Philadelphia and has been chief resident and coordinator of medical services. During the past three years the state has established thirteen heart clinics where patients with a history of rheumatic fever or rheumatic heart disease may register for treatment.

Philadelphia

Annual Health Institute.—The Woman's Auxiliary to the Philadelphia County Medical Society will hold its nineteenth annual health institute April 12 in the auditorium of the medical society building in Philadelphia. Lectures will be given on "The Family and Public Health," "The Fife-Hamill Memorial Health Center," "Experiences with the Rooming-in Project of Baby with Mother" and two motion pictures, one on human growth and another on human reproduction. A panel discussion on the problem child will be conducted in the afternoon.

Comroe Memorial Lecture.—Dr. Ephraim Shorr of Cornell University Medical College, New York, gave the annual Bernard Comroe Memorial Lecture on "The Role of the Liver and Kidney in Circulatory Homeostasis" on April 8 at the Hospital of the University of Pennsylvania, Philadelphia. This is the annual lecture sponsored by the Kappi Pi Chapter of the Phi Delta Epsilon Fraternity at the university.

TEXAS

Texas Health Council.—Plans for organization of the Texas Health Council, a statewide association of the medical profession, allied groups and lay organizations, were completed by representatives of various groups meeting in Dallas March 13. The Texas Health Council plan was proposed by the board of trustees and subsequently approved by the executive council of the state medical association, and at that time Dr. George A. Schenewerk of Dallas, chairman of the committee on public relations, was designated to prepare a prospectus and initiate preliminary arrangements with the other groups for the organization. Representatives of the several participating groups will constitute a planning committee until the organization is completed. Groups invited to participate in the organization of the council are: doctors of medicine and dentists together with the auxiliaries of these groups, nurses, pharmacists; hospitals, medical service, insurance, utility, transportation, education and rural organizations; the newspapers and radio, and the clergy.

UTAH

Ogden Surgical Society Meeting.—The annual meeting of the Ogden Surgical Society will be held May 25-27 with headquarters at Hotel Ben Lomond, Ogden. Scientific sessions will be held in the Orpheum Theater. The society has invited all doctors of the intermountain region to attend without registration fee the three day scientific discussions. The following speakers will address the sessions: Drs. E. W. Alton Ochsner, New Orleans; Roger Anderson, Seattle; Charles W. Mayo and James T. Priestley, Rochester, Minn.; Willis J. Potts, Andrew C. Ivy and Paul W. Greeley, Chicago; Donald G. Tollefson, Los Angeles; Howard C. Naffziger, San Francisco; Alfred E. Maumenee Jr., San Francisco; Howard B. Sprague, Boston, and Lyon H. Appleby, Vancouver, B. C.

WASHINGTON

Spokane Surgical Society Meeting.—The annual meeting of the Spokane Surgical Society will be held at the Davenport Hotel April 9. The guest speaker at the banquet at 7 p. m. will be Dr. James T. Priestley, Rochester, Minn., who will speak on "Some Problems in Surgery of the Stomach and Duodenum."

WISCONSIN

Marquette's Spring Clinic.—Marquette University School of Medicine Alumni will hold a spring clinic at the Veterans Administration Hospital Auditorium May 13-14. Dr. Edward R. Krumbiegel, Milwaukee, commissioner of health of Milwaukee, will receive the annual alumni award.

Honorary Medical Fraternity Membership Awarded to Marquette.—Alpha Omega Alpha, national honorary medical society, awarded a chapter membership to the Marquette University School of Medicine, Milwaukee, at installation ceremonies April 4 in the medical school auditorium. Dr. John S. Hirschboeck, dean of the medical school, received the chapter charter from Dr. Walter L. Bierring, Des Moines, Iowa, national president. Thirteen Marquette students were received into the society.

Personal.—Conrad A. Elvehjem, Sc.D., dean of the graduate school of the University of Wisconsin Medical School, Madison, and chairman of the biochemistry department, has received a grant of $4,000 for research in nutrition from the Robert Gould Research Foundation, Cincinnati. Dr. Elvehjem was a recipient in 1943 of the Willard Gibbs Medal of the American Chemical Society.

ALASKA

Roentgen Examinations for All Hospital Patients.—The Alaska Tuberculosis Association has made arrangements to give roentgen examinations to all patients entering the Bishop Rowe General Hospital in Wrangell. The three month demonstration program is being carried out under the supervision of Dr. Duncan Chalmers of the Alaska Health Department.

PUERTO RICO

Birth Rate in Puerto Rico.—The Puerto Rican birth rate rose to 43.3 to each 1,000 for 1947. The net population increase for the year, according to official figures, was 63,000, representing 87,000 births against 24,000 deaths. The average family on the island numbers 5.3 as compared with 3.7 in continental United States. Population density is close to 635 for each square mile, almost as high as Rhode Island, for a territory smaller than Connecticut. Over a period of seven years infant mortality decreased from 113 to 71 for each 100,000. Stillbirths have been sharply reduced.

GENERAL

Change Harvey Lecture Date.—In order to avoid a conflict with the meeting of the Federation of American Societies for Experimental Biology, the date of the seventh Harvey Lecture, to be given by David Rittenberg, Ph.D., New York, has been changed to April 28.

U. S. Pharmacopoeial Convention.—The decennial meeting of the U. S. Pharmacopoeial Convention has been set for May 9, 1950 at the Hotel Statler, Washington, D. C. A preliminary conference, similar to the one held in 1940, will probably be held the preceding day. Credential forms for delegates will not be distributed until about Dec. 1, 1949, to be returned by March 1, 1950. For information address Adley B. Nichols, Secretary, 4738 Kingsessing Avenue, Philadelphia 43.

Dr. Huenekens Appointed Medical Director of Kenny Foundation.—Dr. Edgar J. Huenekens, chief of staff at Sister Elizabeth Kenny Institute and clinical professor of pediatrics at University of Minnesota Medical School, Minneapolis, has been appointed national medical director of the Kenny Foundation. In his new position with the foundation Dr. Huenekens will be in contact with medical leaders throughout the country with the aim of creating broader understanding of the Kenny concept and treatment of poliomyelitis.

Jessie Horton Koessler Fellowship.—The Institute of Medicine of Chicago announces that its Jessie Horton Koessler Fellowship for the aid of research in biochemistry, physiology, bacteriology or pathology will be available on September 1. The stipend is $500 a year with the possibility of renewal for one or two years. Applications will be received up to July 1, and should be sent in quadruplicate to Dr. Paul R. Cannon, chairman of the Committee on the Jessie Horton Koessler Fund, 950 East 59th Street, Chicago 37. Since there are no formal blanks, application should be made by letter.

Western Association Meeting on Industrial Medicine.—The Western Association of Industrial Physicians and Surgeons will hold its annual meeting at the Biltmore Hotel, Los Angeles, May 7. The morning will be devoted to a panel discussion of the state compensation laws. Afternoon speakers include:

Homer S. Elmquist, Los Angeles, Use of Wire in Inguinal Herniorrhaphy.
Ian G. MacDonald, Los Angeles, Occupation and Trauma in Relation to Cancer.
John E. Kirkpatrick, San Francisco, Injury vs. Gout.
Walter Z. Baro, Los Angeles, Industrial Head and Back Injuries as Seen from a Neurological and Psychiatric Viewpoint.

Broncho-Esophagological Association Meeting. — The annual meeting of the American Broncho-Esophagological Association will be held at the Drake Hotel, Chicago, April 18-19 under the presidency of Dr. Paul Holinger, Chicago. Those delivering papers by invitation include:

Edwin R. Levine, Chicago, Physiological Bronchial Changes Influencing Pulmonary Function.
E. W. Alton Ochsner, New Orleans, Surgery of the Esophagus.
Howard W. McCart, Toronto, Canada, Adenoma of the Trachea.

The banquet will be held in conjunction with the American Laryngological, Rhinological and Otological Society April 18 at 6:30 p. m. The speaker will be Dr. Warren H. Cole, Chicago.

Dr. Bayne-Jones Receives Bruce Memorial Medal.—At the convocation of the American College of Physicians March 30, Dr. Stanhope Bayne-Jones, president of the Joint Administration Board of the New York Hospital-Cornell Medical Center, received the James D. Bruce Memorial Medal. He was cited for his inspirational teaching at the Johns Hopkins University, the University of Rochester and Yale University, where he played an important part in shaping the careers of many young physicians. He was also cited for his contribution during the war as brigadier general in the medical corps of the Army and as deputy chief of preventive medicine in the Office of the Surgeon General.

Research in Spinal Cord Disease.—The National Paraplegia Foundation, sponsored by the Paralyzed Veterans of America, has established a limited number of fellowships for research in spinal cord disease and trauma and in the complications commonly associated with such disease or injury. These fellowships carry a minimum stipend of $3,000 per year and may be awarded to any candidate who has demonstrated a capacity for medical research and has outlined a program of meritorious study. The fellowships will be awarded by the Medical Advisory Committee and are open for award for the academic year 1949-1950. Application forms, obtained from the Chairman, Medical Advisory Committee, 1040-1232 West Michigan Street, Indianapolis 7, should be submitted to him not later than June 1.

Damon Runyon Clinical Research Fellowships.—The American Cancer Society announces the availability of Damon Runyon Clinical Research Fellowships, limited to men and women holding the M.D. degree. These fellowships are made possible through a grant from the Damon Runyon Memorial Fund for Cancer Research to the American Cancer Society, which administers the fellowships on recommendation of the Committee on Growth of the National Research Council. In most cases fellowships will provide a period of training in a hospital under the guidance of a qualified clinical investigator. However, they may be awarded to provide training in a basic science provided that such training is directed toward preparing the fellow for clinical cancer research. Applications may be submitted at any time. Initial awards will be made in time to permit the fellowships to begin July 1, 1949. Communications should be addressed to the Executive Secretary, Committee on Growth, National Research Council, 2101 Constitution Avenue, Washington 25, D. C.

International Cooperation in Cancer Research.—Transactions of the Fourth International Cancer Research Congress are in process of publication in five parts. The first part appeared in 1948 as no. 1, volume 6 of *ACTA; Union Internationale Contre le Cancer,* under the editorship of Dr. Joseph H. Maisin. It amounts to 267 pages of papers in English, French, German, Italian, Russian and Spanish. It is expected that the remaining ones will appear in rapid succession. The price for the complete Transactions is $25, that is, $5 for each of the five parts. Subscriptions should be sent as postal money orders to Dr. Joseph H. Maisin, 61 Voer des Capucins, Louvain, Belgium. Reprints of the papers published in the Transactions can be obtained from Dr. Maisin. It is suggested that those desiring reprints communicate directly with him.

The first annual meeting of the International Cancer Research Commission, established at the congress, will probably be held in Paris July 15-22. Further information can be obtained from the chairman, Dr. Ignacio Millan, Avenida Veracruz 69, México, D. F. Since its formation the commission, then consisting of one representative from each of forty nations, has been joined by Finland, Iceland, Israel and New Zealand. Negotiations are under way for Dr. Riojun Kinoshita to be appointed an "observer" for Japan. Invitations to the first annual meeting have been approved by the Mexican Government and will soon be dispatched by it through diplomatic channels to the member nations and to all others.

Deaths in Foreign Countries

Dr. John T. Conner, London correspondent of The Journal of the American Medical Association, died recently. He was more than fifty years ago a contributor to the *Medical Review* and was the editor in Great Britain of *The Hospital* and *The Clinical Journal.* For many years Dr. Conner was a regular contributor to the editorial columns of *The Lancet.* In his preparation for medicine he was for a while closely associated with Sir Jonathan Hutchinson. Dr. Conner had retired and at the time of his death was living with his son Ian, Vicar of All Hallows, Greenford.

Marriages

Edwin Hastings Mulford II, Little Falls, N. Y., to Miss Esther Davis Smith in Bridgeport, Conn., February 12.

Robert Harris McCarter, Boston, to Miss Dorothy Margaret Douglas of Wellesley Hills, Mass., February 19.

Oliver H. Timmins Jr., San Antonio, Texas, to Miss Joan James in Berkeley, Calif., February 15.

Luther Motier Mace, Beaufort, S. C., to Miss Doris Belle Harris in Norfolk, Va., February 12.

Edwin Paul Stabins, Watertown, N. Y., to Miss Maxine Deutsch in Richmond, Va., February 19.

Nathan Smith Davis Jr., Winnetka, Ill., to Miss Naomi Nichols of Kenosha, Wis., February 12.

Keehn W. Berry Jr., New Orleans, to Miss Murray Brown of Birmingham, Ala., March 1.

Robert R. Rector, Roanoke, Va., to Miss Evelyn Feagans, of Agricola, in McDowell, February 19.

John Stone Hooley, Rockville Centre, L. I., to Miss Betty Grunwald of Brooklyn, February 26.

Elmer Clinton Texter Jr., Detroit, to Miss Jane Starke Curtis of Richmond, Va., February 19.

Deaths

Max Minor Peet ⊕ professor of surgery at the University of Michigan Medical School, Ann Arbor, died March 25, aged 63, of heart attack. Dr. Peet was born in Iosco, Mich., Oct. 20, 1885. He received his degree in medicine from the University of Michigan Department of Medicine and Surgery in 1910, when he became an intern at the Rhode Island Hospital in Providence, serving until 1912. He was a Robert Robinson Porter fellow in research medicine at the University of Pennsylvania School of Medicine in Philadelphia in 1912 and 1913 and an assistant instructor in surgery from 1913 to 1915. From 1914 to 1916 he was an assistant chief surgeon at the Philadelphia General Hospital. In 1916 he joined the faculty of the University of Michigan, was promoted in 1918 to assistant professor, in 1927 to associate professor of neurosurgery and in 1930 to professor of surgery. Since 1918 he had been chief of the neurosurgical division at the University Hospital.

Dr. Peet was a member of the advisory committee to the Committee on Scientific Exhibit of the American Medical Association. He served as vice chairman of the American Board of Neurological Surgery and was a member of the founders group of the American Board of Surgery. In the National Foundation for Infantile Paralysis he was a member of the general advisory committee, vice chairman of the committee on education and publications and at one time member of the committee on virus research. Maintaining a deep interest in the Warm Springs Foundation, Dr. Peet became a director of the organization and in 1937 was cited by letter from the late President Roosevelt for his contribution to infantile paralysis research. He was a fellow of the American College of Surgeons and a member of the American Surgical Association, Society of Neurological Surgeons, Harvey Cushing Society and the American Neurological Association, an honorary member of the Sociedad Argentina de Cirujanos, Los Angeles Surgical Society and the Detroit Academy of Surgery. In 1931 at Berne and in 1935 in London he was a member of the International Neurological congresses and in 1938 of the International Surgical Congress in Brussels.

Dr. Peet was best known for original work on splanchnic section for arterial hypertension, was a contributor of numerous articles on neurosurgical problems to medical journals and chapters on neurosurgery in various surgical works. He was awarded the honorary degree of master of education by the state normal college in Ypsilanti in 1934. For many years ornithology was his hobby, and he possessed a fine collection. A genial scientist and humanitarian, he devoted his life to the principles of the medical profession.

Alexander Taylor Cooper ⊕ Colonel, U. S. Army, retired, San Juan, P. R.; born in Yutan, Neb., April 8, 1883; Medico-Chirurgical College of Philadelphia, 1907; entered the medical corps of the U. S. Army as a first lieutenant in June 1910; training followed in the Army Medical School and in the Medical Field Service School at Carlisle, Pa.; formerly medical chief of the Rodriguez General Hospital; promoted through the various grades to that of colonel in 1936; retired from active duty in 1940, when he joined the staff of the School of Tropical Medicine of the University of Puerto Rico, where he served as liaison officer between this institution and the U. S. Army in Puerto Rico during World War II; on the staffs of the University and Presbyterian hospitals; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; member of the American Academy of Tuberculosis Physicians, Association of Military Surgeons of the United States and the Association of Medical Veterans of World War I; died January 2, aged 65, of a ruptured aortic aneurysm.

James Francis McKernon, New York; born in West Cambridge, N. Y., March 13, 1865; College of Physicians and Surgeons, medical department of Columbia College, New York, 1890; emeritus professor of otology at the New York Post Graduate Medical School and Hospital, where he was elected president of the board of directors in 1911, resigned in 1917, and was reelected in 1919; served as president until his retirement in 1928, when he received the title of honorary president; served in France during World War I; specialist certified by the American Board of Otolaryngology; past president of the Medical Society of the County of New York and American Laryngological, Rhinological and Otological Society; past president and secretary of the American Otological Society; member of the American Medical Association; fellow of the American College of Surgeons; affiliated with the Manhattan Eye, Ear and Throat Hospital; died January 22, aged 83, of diabetes mellitus.

Robert Osgood Brown ⊕ Santa Fe, N. M.; born in Chicago in 1890; Rush Medical College, Chicago, 1914; served as chairman of the public welfare department of the state of New Mexico, as president of the Santa Fe County Medical Association, New Mexico Medical Society, Santa Fe County Tuberculosis Association, New Mexico Social Hygiene Association and the New Mexico Tuberculosis Association; member of the American College of Chest Physicians and the American Trudeau Society; fellow of the American College of Physicians; in 1946 was among eleven distinguished alumni of the University of Chicago who were awarded citations of merit at the annual alumni assembly in June; the citations, established during the university's fiftieth anniversary celebration in 1941, are given in recognition of public service to the community, the nation and humanity; affiliated with St. Vincent Hospital; died February 1, aged 58, of coronary thrombosis.

Hunter Holmes McGuire ⊕ Winchester, Va.; born in Winchester, March 30, 1875; University College of Medicine, Richmond, 1897; specialist certified by the American Board of Ophthalmology; served as a member of the board of visitors of the Medical College of Virginia; member of the American Academy of Ophthalmology and Otolaryngology; and the Association for Research in Ophthalmology; past president of the American Ophthalmological Society and the Medical Society of Virginia; founder and first president of the Virginia Society of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; awarded the Distinguished Service Medal for service during World War I; president of the board of directors, chairman of the executive committee and on the staff of Winchester Memorial Hospital, of which he was a founder; died January 21, aged 73.

Harry George Steele, Bluefield, W. Va.; born in Stewardson, Furnace, Pa., Jan. 15, 1877; College of Physicians and Surgeons, Baltimore, 1903; member of the American Medical Association; past president and secretary of the McDowell County Medical Society; served as president, as secretary and treasurer of the Mercer County Medical Society; formerly councilor of the Fifth District of the West Virginia State Medical Association, of which he had been vice president; in 1944 first vice president of the American Congress of Obstetrics and Gynecology; secretary-treasurer of the West Virginia Society of Obstetrics and Gynecology and a past president; died in Sarasota, Fla., January 29, aged 72, of heart disease.

Abraham Owen Wilensky ⊕ New York; born in New York May 20, 1885; Columbia University College of Physicians and Surgeons, New York, 1907; fellow of the American College of Surgeons; member of the American Association for Thoracic Surgery; formerly on the faculty of Cornell University Medical College; affiliated with Mount Sinai Hospital, Bronx Hospital, Beth David Hospital and the New York Infirmary; consulting surgeon to the Crown Heights Hospital in Brooklyn and the Boulevard Hospital in Long Island City; author of "Osteomyelitis: Its Pathogenesis, Symptomatology and Treatment"; died in Park East Hospital February 4, aged 63, of coronary thrombosis.

John Walter Vaughan, Detroit; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1904; fellow of the American College of Surgeons; formerly assistant clinical professor of surgery at the Detroit College of Medicine and Surgery; in 1913 member of the House of Delegates of the American Medical Association; formerly member of the city board of health; served in France during World War I and received citations for conspicuous service; formerly affiliated with the Charles Godwin Jennings and Harper hospitals; died January 21, aged 68, of coronary thrombosis.

Wayne Bernard Granger ⊕ Emporia, Kan.; University of Illinois College of Medicine, Chicago, 1919; specialist certified by the American Board of Ophthalmology and the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; member of the board of education; on the staffs of St. Mary's Hospital and the Newman Memorial County Hospital, where he died December 26, aged 56, as the result of injuries received when he was struck by an automobile.

Alson Herbert Baker ⊕ Berea, Ky.; Hospital College of Medicine, Louisville, 1905; on the staff of Berea College Hospital; served as city health officer; died December 30, aged 68, of cardiovascular disease with coronary occlusion.

Thomas Jefferson Ballard, Corbin, Ky.; Hospital College of Medicine, Louisville, 1905; died recently, aged 70.

Richard Franklin Cook ⊕ Carrollton, Mo.; University of Missouri School of Medicine, Columbia, 1893; fellow of the American College of Surgeons; served as county health officer; died in Farmington, December 26, aged 77.

John Wiley de Vry, Elgin, Ill.; Bennett Medical College, Chicago, 1907; served during World War I; died December 11, aged 70, of cardiac failure.

Joseph N. Ellis, Seymour, Tenn.; University of Louisville Medical Department, 1891; died in Crossville, December 25, aged 82, of cardiovascular disease.

Russell C. Gourley, Punxsutawney, Pa.; Medical Department of the Western University of Pennsylvania, Pittsburgh, 1894; affiliated with Adrian Hospital; died in Suburban General Hospital, Bellevue, recently, aged 78, of pulmonary infarction.

Evart Hankins, Finchville, Ky.; Kentucky School of Medicine, Louisville, 1897; died December 30, aged 80, of pulmonary tuberculosis.

Louis Albertus Heidel, Springfield, Vt.; University of Vermont College of Medicine, Burlington, 1897; formerly on the staff of the Rutland Hospital in Rutland; died in Brattleboro, December 27, aged 73, of heart disease.

Peter Nathaniel Jacobson, Oakland, Calif.; Cooper Medical College, San Francisco, 1905; member of the American Medical Association; a founder and member of the staff of Peralta Hospital, where he died December 10, aged 68, of heart disease.

Frank L. Keeler, Miami, Fla.; Tennessee Medical College, Knoxville, 1900; member of the American Medical Association; died December 7, aged 74, of bronchopneumonia and fracture of rib as the result of a fall from a chair.

James Charles Keeney ⊕ Hoboken, N. J.; University and Bellevue Hospital Medical College, New York, 1926; for many years medical examiner for the New Jersey State Workmen's Compensation Board at Trenton; served during World War II; on the staff of St. Mary's Hospital, where he died December 15, aged 48.

Roscoe Belden Martindale, Worthington, Iowa; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1895; died recently, aged 81, of arteriosclerosis.

George Alec Poland, Pleasantville, N. J.; Jefferson Medical College of Philadelphia, 1925; member of the American Medical Association; member of the staff of Atlantic City (N. J.) Hospital, where he died December 19, aged 56, of cerebral hemorrhage.

Frank Anthony Pugliese, Punxsutawney, Pa.; Temple University School of Medicine, Philadelphia, 1935; member of the American Medical Association and the American Society of Clinical Pathologists; pathologist at Adrian Hospital; died recently, aged 40, of bilateral pneumonia complicated by acute lymphatic leukemia.

Robert Conrad Ruedy ⊕ Washington, D. C.; George Washington University School of Medicine, Washington, D. C., 1904; also a graduate in pharmacy; died December 27, aged 72, of coronary occlusion.

Richard Lee Russell, Ashland, Mo.; Kansas City (Mo.) Medical College, 1905; Eclectic Medical University, Kansas City, 1906; served during World War I; formerly associated with the U. S. Public Health Service; at one time physician for the state penitentiary; served as health officer of Miller, Webster and Greene counties; for many years affiliated with the state board of health; died in St. Mary's Hospital, Jefferson City, December 24, aged 71, of hypertension and heart disease.

William Daniel Schafer, Portsmouth, Ohio; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1910; health officer and city physician for New Boston; died December 23, aged 62, of coronary embolism.

Dewey Ernest Schultz, Benavides, Texas (licensed in Texas in 1937); died December 3, aged 50.

George Washington Sherouse, Campville, Fla.; Atlanta School of Medicine, 1910; died recently, aged 63, of cerebral hemorrhage.

Junius Boyette Surles, Four Oaks, N. C.; Jefferson Medical College of Philadelphia, 1909; died January 11, aged 67, of heart disease.

Ernest Walter Tallman, Gaylord, Kan.; St. Louis University School of Medicine, 1905; member of the American Medical Association, died in St. Anthony's Hospital, Hays, recently, aged 72, of heart disease.

Edward Chapin Terrill, Mobile, Ala.; University of Alabama School of Medicine, 1909; member of the American Medical Association; died recently, aged 62, of cerebral hemorrhage.

Pius Lee Thompson ⊕ Grand Rapids, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1903; fellow of the American College of Surgeons; past president of the Kent County Medical Society; affiliated with St. Mary's Hospital; died in Gulfport, Miss., January 18, aged 71, of angina pectoris.

Alvah Harry Traver ⊕ Albany, N. Y.; Albany Medical College, 1898; associate in surgery at his alma mater; fellow of the American College of Surgeons; on the staffs of the Child's and Albany hospitals; died January 22, aged 73.

Elias Doar Tupper, Summerville, S. C.; Medical College of the State of South Carolina, Charleston, 1905; member of the American Medical Association; on the staff of Dorchester County Hospital; died January 20, aged 69, of nephritis and splenomegaly.

Marcellus M. Turlington, Seminole, Okla. (licensed in Oklahoma under the Act of 1908); member of the American Medical Association; died January 5, aged 80, of paraplegia and arteriosclerosis.

James Samuel Unger, New York; Columbia University College of Physicians and Surgeons, New York, 1896; formerly on the staff of the Manhattan Eye, Ear and Throat Hospital; died January 19, aged 74, of coronary sclerosis.

James Edgar Vance, San Bernardino, Calif.; Barnes Medical College, St. Louis, 1894; died in Louisville, Ky., January 11, aged 81, of heart disease.

Crawford Lee Vines, Kilgore, Texas; Memphis (Tenn.) Hospital Medical College, 1910; member of the American Medical Association; died recently, aged 65, of cerebral hemorrhage.

Paul Chamberlain Walter ⊕ Progress, Pa.; Johns Hopkins University School of Medicine, Baltimore, 1923; for many years affiliated with the Harrisburg (Pa.) Hospital, where he died recently, aged 51, of reticulum cell sarcoma of the mediastinum.

Lawrence Shapiro Ward ⊕ New London, Conn.; Cornell University Medical College, New York, 1931; specialist certified by the American Board of Internal Medicine; affiliated with Lawrence and Memorial Associated Hospital, where he died December 16, aged 40, of carcinoma of the colon.

James E. Warrick, Valentine, Neb.; College of Physicians and Surgeons, Baltimore, 1888; died January 17, aged 84, of nephritis.

Simon James Watkins, Covington, Ky.; Meharry Medical College, Nashville, Tenn., 1891; died recently, aged 87, of heart disease.

Abel E. West ⊕ Philadelphia; Leonard Medical School, Raleigh, N. C., 1908; died January 9, aged 72, of bronchopneumonia.

Walter James White, Atlantic Highlands, N. J.; University of Vermont College of Medicine, Burlington, 1899; died in the Tilton General Hospital, Fort Dix, December 27, aged 73, of nephrosclerosis and arteriosclerotic heart disease.

Washington A. White, Cambridge, Ohio; Eclectic Medical Institute, Cincinnati, 1880; died February 10, aged 98.

Daniel Newton Williams, Chattanooga, Tenn.; University of Tennessee College of Medicine, Memphis, 1911; member of the American Medical Association; past president of the Chattanooga-Hamilton County Medical Society; served during World War I; for many years affiliated with Erlanger Hospital; on the staff of the Florence Crittenton Home; died in the Pine Breeze Sanatorium January 7, aged 68, of tuberculosis.

William Woodford Woody, Tulsa, Okla.; Kentucky University Medical Department, Louisville, 1906; served during World War I; formerly city health officer; died in the Veterans Administration Hospital, Muskogee, December 7, aged 68, of coronary sclerosis.

Charles Cowing Zacharie, Marlboro, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1895; member of the American Medical Association; served during World War I; died in Veterans Administration Hospital, New York, recently, aged 75, of carcinoma of the prostate.

The Fellowship for Freedom in Medicine

The Fellowship for Freedom in Medicine, which was formed under the chairmanship of Lord Horder to work for amendment of the Act establishing the National Health Service, has attained a membership of 2,200. Speaking at a meeting when it adopted a constitution as a registered company and decided on future policy, Lord Horder said that they did not aim at repeal of the Act. The Health Service had achieved a certain momentum and at some points, as in the regionalization of hospital services, there were clear improvements. But the Minister of Health had not yet introduced the Act which he had promised to secure doctors against the possibility of being made whole time servants. Nor had he implemented his promise to submit new regulations. The Fellowship would press for that. For the "betterment factor" agreed by the Spens Committee the Minister had decided on a figure of 120 per cent while the actual increase was 185 per cent.

The meeting adopted a constitution as a registered company and decided on future policy. The following are among the registered objects. (1) To insist on the preservation of the highest standards of medical practice. (2) To protect the public and the medical profession from state monopoly in medicine. (3) To preserve the ethical and professional freedom of the individual doctor in the service of his patients and to maintain the status of the general practitioner, including his financial security. (4) To oppose all encroachments of the State on the independence of medical institutions and maintain the academic freedom of all teachers of medicine. (5) To define the limits of state medicine so as to protect the rights of the public and of the medical profession in relation to all types of independent practice. (6) To support and protect the character, status and interest of the medical profession generally.

Remedy Which Protects Cattle Against Trypanosomiasis

A new drug to protect cattle from the tsetse fly in tropical Africa, which is called "antrycide," is described by the Colonial Office as a great advance and is regarded as a means of making safe for cattle rearing 4,500,000 square miles. The drug is the result of the work of a team of chemists, biologists, veterinarians and pharmacists which began in Manchester in 1944. They tested many synthetic compounds likely to be effective against the trypanosomes in the blood stream, which cause the disease. At first they experimented with mice, and on discovering a new drug known as M.7555 they removed the laboratory equipment and staff to parts of Africa where the disease is endemic. In the worst areas they found that "antrycide" cured all forms of trypanosomiasis in cattle, horses, camels and other animals. It also had a prophylactic effect and produced no undesirable reactions. A single treatment cured cattle of Trypanosoma congolense and Trypanosoma vivax infections, the two worst forms of the disease. It was also successful against Trypanosoma brucei infection in cattle, horses and dogs, against Trypanosoma evansi in cattle and Trypanosoma simiae in pigs.

Experiments with immunization of cattle are still proceeding, but it has been shown that "antrycide" in most cases protects against T. congolense for six months. Experiments which are to continue until May appear to show that infections recurring after only four months may be expected to respond to a second treatment. Cattle protected against T. vivax have in most cases remained immune for four or five months. Precise information must be secured on the period of immunity, for this will determine the number of times a year that cattle must be rounded up for treatment. "Antrycide" is a white crystalline powder soluble in water and is administered by hypodermic syringe. It is intended to give simple instructions to cattle owners so that they can use the drug. Imperial Chemical Industries, which has taken part in the research, expects to produce two or three tons of "antrycide" next year, sufficient to cure or immunize 2,000,000 animals. At first supplies will be limited and will go to the Governments of the Sudan, Kenya and Uganda, where the need is urgent. It will not be necessary to immunize every animal in a stock raising area, but only those on the edge of the bush. As a result of the discovery the Colonial Office looks forward to a vast extension in Africa of the area of mixed farming.

Immunization Against Diphtheria

The Ministry of Health reports a steady decline in diphtheria since 1941, when their immunization campaign got under way. In that year deaths and cases in the great towns numbered 1,487 and 27,613 respectively. The deaths were fourteen times more and the cases over five times more than in 1948. The deaths in 1948 were the lowest on record. They totaled 100 in the twenty-six great towns which cover about half the population of England and Wales. The notifications of cases numbered 5,182, another new low record. This steady decline in diphtheria since the war is in striking contrast to the position in other European countries, where the disease followed the march of the German armies and the incidence rose alarmingly. In the Netherlands, for example, there were 219,772 cases in the six years 1941 to 1946, compared with 8,649 in the previous six years.

"A Pill Dispenser and Filler-in of Certificates"

Dr. B. U. Coffey, a country general practitioner of Ixworth, Suffolk, has written to the Ministry an open letter about his practice under the National Health Service. "I no longer practice medicine," he says. "I'm just a pill dispenser and a filler-in of certificates." To this routine many practitioners are reduced by the time wasted by persons with little or nothing the matter, because they have to pay nothing. This has been paralleled in New Zealand by the state medical service, in which the treatment is so perfunctory that it has been compared to "sheep dipping," a process well known in that country. The time of the practitioner wasted in England in the filling in of certificates and other forms has given rise to loud complaints from many doctors.

Doctor or Dentist: Who is Responsible for Treatment?

In the work of the National Health Service difficulties are constantly arising. The latest is the case of a patient who complained of bleeding from the gums after tooth extraction the day before. He summoned his doctor, who thought that the dentist should also be sent for. He was summoned at 1:30 a. m. and refused to go. He denied that the treatment of the patient was his responsibility and said it was the doctor's. In the whole course of thirty-five years' practice he had never been asked to go out in the middle of the night to attend such a case. The local National Health Committee decided to tell the dentist that he was wrong and ought to apologize to the doctor. They also asked the Minister of Health for a ruling in such a case.

The British Postgraduate Medical Federation

Postgraduate traveling fellowships for 1949-1950, tenable for one year, have been awarded to J. V. Crawford of the London Hospital (neurosurgery, United States); J. S. Prichard, of the National Hospital, Queen Square, and the Postgraduate Medical School, Hammersmith (neurology, United States and Canada); R. D. Tonkin, of Westminster Hospital (general medicine, United States and Canada), and J. E. M. Whitehead, of St. Thomas's Hospital (bacteriology, Scandinavia).

PARIS

Feb. 12, 1949.

Surgical Treatment of Arterial Hypertension

Riser, Ducuing, Lazorthe and Dardenne (Toulouse) considered nephrogenic hypertension little susceptible of improvement through surgical treatment, in comparison with neurogenic or essential hypertension, which is suitable for operative intervention. After experimenting with all technics, they prefer Smithwick's, accompanied, in certain cases, with unilateral adrenalectomy. Wertheimer and Lecuire (Lyons) have presented results of thirteen years' experience with Peet's operations: 1 death through operation; 8 subsequent deaths; in 4 out 6 improved cases the lowering of hypertension has been maintained. In 30 cases of thoracolumbar sympathectomy among which 17 were bilateral, 4 deaths occurred through operation. In 22 cases of unilateral adrenalectomy associated in 17 cases with sympathetic intervention, the authors have noted: 1 death during operation, 4 deaths within one to two years and 12 survivors with 7 good results and 5 unfavorable. Fontaine (Strassburg) in 37 adrenal operations had 5 deaths, 12 very satisfactory results, 8 satisfactory, 6 improvements and 6 failures. The author considered as the best technic left adrenalectomy plus splanchnicectomy, accompanied by bilateral lumbar sympathectomy. Thoracolumbar operations showed a more noticeable effect on tension. M. Peet (Ann Arbor) presented results of operations in 2,100 cases since 1933. He noted 1.6 per cent mortality in the cases without papillary edema, 10 per cent in the malignant form with papillary edema, and 2.2 per cent in cases of hypertension with cerebrovascular accidents. The first 1,000 patients after five years showed 13.5 per cent normal, 41.5 per cent improved, 12.5 per cent without change and 32.5 per cent dead.

The next congress will take place during the second fortnight of September 1949. On the agenda are: (1) Surgical Treatment of Cancer of the Pancreas; (2) Treatment of Osteomyelitis with Staphylococci, and (3) Indications and Technics of Electrosurgery (Except for Urology).

Congress of Surgery

The treatment of cancer of the breast, either by surgery or by surgery associated with radiotherapy, selection of patients to be treated by one of these methods and best methods of preparation in order to avoid relapses and metastases were on the agenda of the fifty-first congress of the French Association for Surgery, which was held in Paris in October 1948. Professor Fiolle (Marseilles) presided. On the strength of 1,037 observations, Professor Ducuing (Toulouse), director of the Anticancer Center of this city, believes that radiosurgical treatment improves the percentage of recoveries and survivals, but increases the frequency of relapses and "ligneous brachia." In 600 cases, Mayer (Bruxelles) obtained 60 per cent survivals over five years with surgical treatment only. He recommends axillary implantation of two tubes of radium after operation. Tailhefer (Paris) (Curie Foundation and Anti-Cancer Center of the Paris Hôtel-Dieu Hospital) obtains 83 per cent of survivals of over five years and 67 per cent of survivals of over ten years by surgical treatment only. He recommends preoperative radiotherapy in tumors of over 5 cm. with important adenopathy and postoperative radio therapy when examination has revealed lymph node involvement. Cukor (Budapest) applies preoperative radiotherapy until mobility of the tumor is obtained. He then removes the tumor and lymph nodes. In 628 cases he has noted only 4 per cent of relapses. Leger (Paris) obtains good results with radiotherapy followed, after a delay of eighteen days to three months, by surgical removal with lymph node curettage. Decker (Lausanne) esteems postoperative radiotherapy as more logical, as it is more capable of acting on a region rendered thinner. Redon, of the Paris Villejuif Anti-Cancer Center, has obtained, through postoperative radiotherapy, 64 survivals of more than five years, without relapses or metastases, in 114 cases. Chalnot (Nancy), on the basis of his experience in 110 cases and the statistics of the Anti-Cancer Center of Lorraine, also recommends surgical intervention, followed by radiotherapy in cases with controlled lymph node invasion. Santy and Dargent (Lyons) presented the statistics on 1,531 cases of their anticancer center. They recommend preoperative and postoperative semiteleroentgen therapy. Baclesse (Paris) presented 145 cases (operable, as well as inoperable) attended at the Curie Foundation with interesting results obtained solely through roentgen therapy. Results were related to a particular technic (high doses and spreading out over a long period) which is still under study and requires long experience. Dargent (Lyons) considers hexestrol the medication of choice for advanced cancer in the 60 to 70 year age group. In 90 cases of advanced cancer, castration did not produce lasting results. A. Sicard (Paris) considers surgical castration preferable to castration by radiation. Castration should be systematically performed after surgical removal of the breast, especially in the still menstruating woman.

International Union Against Cancer

From July 18 to July 21 a general meeting of the board of directors of the International Union Against Cancer will take place in Paris. It will include the ordinary general meeting and an extraordinary general meeting, the latter being devoted to amendments to statutes. All delegates of government or private organizations, members of the International Union Against Cancer and associate members are invited.

The fifth international congress for scientific research and the fight against cancer will take place in Paris July 17-21, 1950. Professor Lacassagne will preside. Registrations will be received immediately at the head office of the International Union Against Cancer, 6 avenue Marceau, Paris (8°).

Specialist Training in Faculty of Medicine

The Paris Faculty of Medicine has prepared an extensive plan for graduate teaching in the practical aspects of medicine, surgery and obstetrics for the scholastic year 1949. The plan includes: May 13 to 19, "The International Week for Cardiology of the La Pitié Hospital," under the direction of Professor Lian; May 20 to 22, "The Medical Days of the Broussais Hospital," under the direction of Professor Pasteur-Valery-Radot; in March 1949 the "Pediatry Days at the Children's Hospital" under the direction of Professor Debre. Two days are provided for the study of the social and medical problems of poliomyelitis. The Lyons Faculty of Medicine has organized similar teaching courses for practitioners of Lyons and the surrounding district.

Diplomas for Specialists

New diplomas have been created in the faculties of medicine, and medicine and pharmacy corresponding to the new system of specialization mentioned in previous letters. They will be: (1) Diploma of Pediatrist, the training for which will last three years followed by an examination. Chiefs of services and assistants will only undergo two years' probation; (2) Diploma for Electroradiology, necessitating three years of theoretic studies and practical exercises, each being sanctioned by a preliminary examination which is indispensable for admission to the final examination; (3) Diploma of Anesthetist-Reanimator, corresponding to the great need in France for specialists in this field; (4) Diploma for Serology, applied to the diagnosis of syphilis; it is indispensable for chiefs of laboratories practicing serologic analysis. French doctors, foreign doctors having a French or foreign diploma and medical students having twenty "inscriptions" are accepted for admission to these courses.

Correspondence

THE ANESTHESIOLOGIST AND THE HOSPITAL

To the Editor:—The article by James Raglan Miller, M.D., entitled "The Relationship of the Anesthesiologist to the Hospital," which appeared in THE JOURNAL, January 1, page 9, has dealt with the relationship of anesthesiologist to the hospital in a very intelligent manner. There is much more which could be said concerning this subject, but most of it would fall strictly into the field of individual hospital management, in a host of specific examples. I believe the most important problems concerning strained and abnormal relationships have at least been mentioned in his presentation. Certainly he is correct in his main contention that in most instances in which relations are abnormal and unhealthy the fault lies in the fact that the anesthesiologist is not on a par with other men on the staff and frequently is not even a member of the medical staff.

It is almost unthinkable that a hospital would employ a specialist and not expect or allow him to be a member of the staff. It is more ridiculous still to think of a medical staff which would not expect and insist that a fellow physician be made a member of the staff. And the greatest surprise of all to me is that an anesthesiologist would accept a job in a hospital where he was not on an equal footing with other physicians—as a member of the professional staff. If he is in charge of his department and specialty I cannot imagine him other than a voting staff member on the same level as a surgeon or internist.

I never could see but one workable system in any hospital as far as relations between staff and management go. The professional staff should have no less than all the say in medical hospital services and the management should direct its attention to nonmedical hospital services only. This means a well organized staff, with departmental organization perfected to function in behalf of all specialties. The problems involved with surgery should be settled and controlled by surgeons, those of obstetrics by obstetricians, and so on. I cannot conceive of any other fair and practical way to operate intelligently medical services of any and all kinds in the best interests of the patient. If the hospital management were to devote its entire attention to nonmedical services and the staff, through its departmental organization, operate all medical services the patient would fare far better than he does most of the time.

Professional staffs of hospitals all agree that anesthesiology is a part of the practice of medicine, and why, in so many instances, they have not busied themselves to see that it is operated as such is beyond my comprehension. I believe that most state medical boards have ruled thus in the last twenty-five years. This makes the problem national and not a local one.

I live in hope that perhaps our new code of ethics of the American Medical Association will make it unethical for a physician to sell his professional services to nonprofessional persons, such as hospital management, if exploitation on the part of the hospital is attempted and if his salary is not commensurate, to a large degree, with the skill and service rendered. This will remove the temptation of the weak anesthesiologist who accepts a salary as security without caring too much whether he is being exploited or not.

The report and recommendations of the Massachusetts Medical Society which the author mentioned are excellent pieces of work and are pioneer works in the medical profession's crusade to keep medical services medical and within the control of the profession. Organized hospital management is big business and can swing a big stick if the profession becomes wishy-washy and indifferent to the protection of its members and exploitation of its services. But without the profession the hospital would be helpless. It is high time that the hospital staff direct its own operation and dictate its own policies and services. I should like to say amen to Dr. Goin's statement referred to in Dr. Miller's paper that it is a must for the profession to decide hospital policies in the field of medical care and that hospital trustees included in nonprofit hospitalization insurance plans must be told what they can and cannot do in the dispensing of medical services. Plans which offer to pay for medical services such as anesthesia, if supplied by the hospital, are not friends of the profession and should be denounced openly. Organization and strong self government of hospital staffs will prevent transgression on the part of management.

H. BOYD STEWART, M.D., President
American Society of Anesthesiologists
2500 E. 27th Place, Tulsa, Okla.

NOTE.—The letter was referred to Dr. Miller, who replies:

To the Editor:—I sincerely regret that my absence from the country made it impossible for me to reply at the time to Dr. H. Boyd Stewart's discussion of my paper on "Relationship of the Anesthesiologist to the Hospital" which appeared in THE JOURNAL, January 1, Page 9. I note that Dr. Stewart's discussion is generously in agreement with the general theme and the details of my paper and that he has emphasized fundamental aspects of the problem; namely, that medical policies should be the responsibility of the medical staff. I believe that most difficulties arise where the staff does not meet its responsibility. The individual anesthesiologist should not be expected single-handed to enter into contracts with hospital management without the guidance and advice of his senior colleagues. It is in their own interest as well as his and in the interest of sound medical practice to establish a simple and effective mechanism such as the suggested "prudential committee" to see that this function is fulfilled. Any other committee to which the duty is assigned would be satisfactory so long as it is done.

The principal argument of my paper is to the effect that with respect to unsatisfactory relationships between the anesthesiologist and hospital management, though they may be frequent and constitute even a problem of nationwide proportions, the solution is a function that can only be performed locally. The underlying principles to be observed have been clearly stated.

JAMES R. MILLER, M.D.
Hartford, Conn.

INCREASES IN REQUIREMENTS OF VITAMIN C IN VARIOUS CIRCUMSTANCES

To the Editor:—In THE JOURNAL, Dec. 4, 1948, page 1042, an editorial entitled "Vitamin A and Ascorbic Acid" called attention to recent experiments emphasizing the interdependence of action between vitamins A and C. The existence of an increased requirement of ascorbic acid in the rat in hypovitaminosis A has been extended to cover such various circumstances as hypervitaminosis A, cold temperatures and high dietary levels of proteins. An underlying common mechanism could be the existence of an accelerated rate of protein catabolism. This might also account for the earlier demonstration by Menten and King that vitamin C affords some measure of protection against the toxins of diphtheria and other infections. The evidence, which can be added to that regarding the thiamine-carbohydrate and nicotinic acid-tryptophane relationships, emphasizes anew that vitamin requirements are not fixed quantities but are largely dependent on diet pattern, health status and environmental conditions as well as on age and physiologic circumstances. They underline the wisdom of speaking, as do the Recommendations of the Food and Nutrition Board of the National Research Council, of allowances rather than of requirements when dealing with the dietary needs of populations.

JEAN MAYER, PH.D.
Washington, D. C.

DETECTION OF CANCER

To the Editor:—A recent editorial in The Journal notes the increasing attention being paid to the attack on cancer and the more general cooperation being given to it. Early diagnosis is stressed as today's best hope for cure of the disease.

The editorial especially urged periodic examination of apparently well persons over 40 for accessible silent tumors and the medical examination of persons with any one of the symptoms which are recognizable indications of the presence of the disease in early stages. "Such examinations in physicians' offices would provide the United States with over 100,000 detection centers," the writer adds.

With the "detection clinic" system, the Journal editorial estimated the cost of detection of a single cancer in one thousand complete clinical examinations of persons without symptoms—as was originally intended—at no less than $25,000. Other estimates have set the figure as low as $10,000.

In commenting on this editorial it has been stated: "The establishment of cancer detection clinics, therefore, cannot be a solution of the cancer problem, because of the impossibility of establishing—and paying for—enough of them to examine the whole population. The answer apparently lies in a greater voluntary public use of the existing skills and facilities provided by private medical practitioners. Every doctor's office might become a detection center, thus providing a great number of places from which victims of the disease in its early stages could move on for treatment, resulting in many cases in cures or completely arrested conditions. In the present stage, the fight against cancer depends in the first place for whatever success is possible without far greater knowledge of causation upon the public itself."

The doctor's office is a logical cancer detection center because only he will see the masses of the people, but to depend on "existing skills and facilities" to detect early cancer adds a note of defeatism. It is not easy to detect early cancer by clinical examination. Indeed, to succeed in finding a curable cancer while in the fleeting early clinical stage has often been referred to as "almost accidental." In the past we have overstressed routine clinical examination because it was the best hope that medical science had to offer. This is no longer true, especially in certain common types of cancer. A revolutionary advance in cancer detection methods, for the first time, places in the hands of the practitioner a powerful weapon to achieve early diagnosis. A regular cervical cytology test should bring the woman over 30 to the physician's office annually, permitting a complete examination. The common cancer of the cervix would be controlled, and other less common areas would have the benefit of regular scrutiny at least.

If the one hundred thousand doctors used the cervical cytology test as a routine on their female patients, it is my belief that of the 26,000 women who annually die of uterine cancer in America, perhaps 20,000 could be saved today! How could this become possible when there are so few trained cytologists to interpret the tests? Herein lies a clue to the application of this revolutionary aid in cancer screening. While the number of experienced cytologists is still small, this problem has been solved by the utilization of the expertly trained eyes of many technicians to screen out the normal slides. The normal ones may be efficiently eliminated by the screeners, while all positive and doubtful slides are reserved for the diagnosis by the cytopathologist.

An interesting experiment in cancer control has recently been completed in the Cytology Center in Montreal and the Cytology Institute in New York. Air mail was used to send slides to the specialized laboratory from the doctor's office. For over three years regular cancer diagnostic service has been rendered to doctors as far distant as Miami, Fla. Air mail permits reporting in two to four days. Physicians from forty-two states and eight provinces of Canada have mailed in a total of 3,455 cytology slides from their offices during the past three and a half years. Using this air mail cancer detection system, 109 cancers were diagnosed, and in an additional 143 cases the diagnosis of "precancer" cell changes was made. Of course, many of these were taken because they were clinical suspects. They were not all well patients. Even so, it is estimated that perhaps 100 lives have been saved from cancer through this limited diagnostic screening program. Many early and curable cases were found. The cytology test selects the case which requires a surgical biopsy for confirmation, although in the early "preclinical" stage it has proved superior to biopsy. Cytology, then, greatly strengthens the hand of the family doctor in the detection of this common type of female cancer.

If this system is practical and efficient on a small scale, why could it not be applied on a grand scale? The test is so efficient as a cancer detector that it should be made available to all classes, rich and poor, perhaps free of charge—or at least at minimal cost.

Screening by cytologic methods for the detection of other types of cancer, while less effective than in the cervix, still presents a substantial advance in diagnosis in pulmonary, gastric, bladder and prostate cancer, this same system being used which was evolved by Papanicolaou and others. It is my feeling that what is needed to put "teeth" into the "physician's office cancer detection program" is the setting up of centralized cytologic laboratories to which he may mail his tests for screening and interpretation by expert cytologists. Herein lies a tremendous opportunity for tangible progress along the road of cancer control.

Macdonald of the Mayo Clinic, who has had extensive experience in screening of the sputum for lung cancer, is of the opinion that mass screening of the sputum is a practical possibility today. Therefore, a routine annual sputum test for cells should bring the male patient to the physician for his regular cancer detection examination.

In the female, if patients attending a physician for a routine cancer examination had no further examination than a simple cervical smear or scraping, a breast palpation and a rectal examination, more cancer would be detected per patient than with any other known system of cancer examination. Yet the cost of this examination is extremely small. It is estimated that it should not cost as much as an appendectomy to detect a cancer in a female using this simple system. What is more important, the cancer when detected will not always be in an advanced and incurable stage. At least, we may definitely claim this in the cervix if a routine scraping is done. This new test is revealing an ever increasing volume of cancers in the early stage, developing in cervices which are clinically normal and which behave in a normal fashion. Such findings indicate that to diagnose the cancer while it is early, testing and examination must become a routine procedure at perhaps one to two year intervals rather than to be dependent on the appearance of a tumor or of symptoms of pain or bleeding before a search for cancer may be undertaken.

Galen, in the second century, was the first to make the echoing statement: "Early diagnosis is necessary if cancer is to be cured." Today, after nearly two thousand years, we are still repeating this slogan, but something new is needed besides propaganda and repetition of this statement. Cytology is the first tangible advance really to make possible this early diagnosis, and, therefore, to increase the number of cancers which will be cured.

Bureau of Medical Economic Research

A MEDICAL SERVICE AREA MAP OF THE UNITED STATES

A Progress Report

FRANK G. DICKINSON, Ph.D.
Director, Bureau of Medical Economic Research
Chicago

For the first time, a medical service area map of the United States is presented. The maps of the eastern and western sections of the United States resemble a jigsaw puzzle because the areas vary so much in shape and size. (The two maps overlap slightly on the eastern edge of the western half and the western edge of the eastern half.) The areas are somewhat larger west of the Mississippi River. The boundaries of only a few of these areas coincide with the boundary of a county, and even in these few cases for a stretch of only a few miles.

There are 757 areas,[1] of which 212 areas straddle the boundaries of two or more states; the other 545 are intrastate areas. The areas are mutually exclusive and cover every square mile of land and every home in the United States. There are physicians in each area from whom the people of that area obtain most of their medical care. Every person in the United States lives in a medical service area where there are physicians. The distance to the nearest physician varies considerably. The completed study will show the approximate number of persons in each area who reside a considerable distance from the nearest town in which there is a physician.

TYPES OF CENTERS

There is only one set of areas, but there are three types of centers. At present there are 1,090 primary medical service centers, or roughly one and one-half primary centers per area. Eighty-seven of the 1,090 primary centers are prime-primary centers. The number of secondary centers cannot be tabulated until the new American Medical Directory is completed. Every town with one or more physicians is considered a secondary medical service center if it is not sufficiently important to be classified as a primary center. Unlike the primary, the prime-primary centers measure up to a uniform national definition. Each city so designated offers every type and kind of medical treatment and surgery. Many cities containing a considerable number of physicians are not designated as prime-primary centers because they do not provide brain surgery; in a few cases the absence of chest surgery has kept the city off this list of prime-primary centers.

The primary medical service center is one which, relative to the nearby towns, is a primary source of medical care. We have not followed any rule as to minimum size or minimum number of physicians or any other minimum measure of supply in choosing the primary center. In fact, some of the primary centers in the Rocky Mountain section contain few physicians, but, relative to the area served by these physicians, these towns are outstanding as sources of medical care and are properly designated as primary centers. On the other hand, there are towns in the East which are not so designated even though they have two or three times as many physicians as some of the primary centers in the Rocky Mountain area; the reason for not designating them as primary centers is that they are overshadowed by the primary centers—larger towns nearby with a larger number of physicians. The primary medical service center is essentially the same term as "primary trading center" used in market research. Our modification of this traditional marketing term should not obscure the fundamental concept involved. The primary medical service center and the medical service area belong in the literature of marketing as well as in the literature of medical economics.

AREAS: MEDICAL AND TRADING

Before a description of a medical service area is presented a few statements regarding the trading area idea may be helpful to physicians. Every store has an area from which it secures customers. The news counter in an office building draws most of its customers from the building. A neighborhood grocery usually draws its customers from the radius of a few blocks. Department stores in the central shopping section will attract customers from a distance of many miles. A retail trade area means the territory from which the retail stores in the principal center (or centers) secure a considerable part of the purchases made by the consumers in that area. The consumers in the smaller towns near the border of the area do more business in the center (or centers) of that area than they do in other areas.

In the present study we are concerned with the purchases of the services of physicians, not of groceries, hardware or the better grades of women's dresses. The established procedures for laying out marketing areas have been followed in this study. In particular, we are trying to show where the patients live who are served by the physicians in the towns and cities of the area. Some patients do obtain some or all of their physician services outside their own area—a feature of all trading areas.

Under our guidance the constitutional or executive secretary of each state medical society has tediously considered the "flow of medical trade" in every community, county and section of his state. The secretaries of many county societies have given much information about local conditions. Letters were obtained from physicians of long experience in many communities, especially along the state borders, before the boundaries of the medical service areas were finally drawn. It must be understood that physicians, through their referrals, give direction to the flow of medical trade. In the absence of a better summation of all services

---

I have consulted my former colleague of many years, Professor Paul D. Converse of the University of Illinois, at several stages and drawn on his great fund of knowledge about marketing problems and his wide experience in trading area matters.

Charles E. Bradley, Ph.D., Associate in Economics, has been in active charge of this study since October 1948. Janith Turnbull Bierbaum, Research Assistant, has been responsible for the maps and the many details of the Bureau's contacts with the state medical society offices since July 1948; prior to July 1948 this part of the task was performed by Olga Lycyniak, Research Assistant.

As stated in the text, the contributions to this study by officials of the state medical societies—in most states the constitutional or the executive or the field secretary—particularly in fixing the boundaries and designating the centers, have made these several score of persons co-authors, in a sense, of this progress report. Their names and titles will be given in the book manuscript, which should be completed late in 1949. I sketched the need for and the objectives of this study two years ago, soon after the study was started (Medical Service Areas in the United States, J. A. M. A. **133**: 1014-1015 [April 5] 1947). Briefly stated, the task was described as the establishment of "patient" areas to replace the unrealistic, anachronistic, rigid political areas traditionally used in medical economics to measure the supply and distribution of physicians. That short article, supplemented by mimeographed instructions, trading area maps and many letters, has guided the efforts of these executives of the state medical societies.

1. Cf. the 760 areas in Health Service Areas (Mountin, J. W.; Pennell, E. H., and Hoge, V. M.: Health Service Areas, Public Health Bulletin 292, Federal Security Agency, United States Public Health Service, 1945). In our study, as in theirs, the number of areas is approximately one fourth the number of counties.

* In this table the states are arranged in nine regions but the arrangement within each region is determined by the sequence of code numbers. The code numbers run from 1 to 946 for the 757 areas. There are four unused numbers between each state and one following the District of Columbia. These unused numbers are for possible future expansion or changes in areas. The code number of the area is located in the top or north part of the area or, where convenient, in the northeast corner of the area. The order of numbering areas follows the same general rule starting with the area in the state farthest north or northeast and numbering from right to left for the top tier and from left to right for the second tier and from right to left for the third tier. This system is an adaptation of the surveyor's method of numbering sections in a township, but it is difficult for the reader to follow because of the irregular shapes and sizes of the areas. The numbers are consecutive within the state. The area code number will be punched into the punch card of every physician in the area. Henceforth the Bureau will use only medical service area and state groupings of physicians in its published statistical summaries.

The order in which the states in each section are numbered follows the same rule; that is, the state farthest north or northeast has the lowest set of numbers (columns 1A and 2A). The next state in the numbering system is west, or west and south of the first state. Again this order of states in the numbering has been an adaptation of the surveyor's method of numbering the sections in a township.

† Of the 757 areas, 212 straddle the boundaries of two or more states as shown in columns (2) and (2A). The remaining 545 are intrastate areas; the number of intrastate areas for each state is shown in column (1) and the code numbers of the intrastate areas in column (1A). Of these 212 interstate areas, 169 have primary centers in only the one state and are assigned to that state; 42 areas have primary centers in two states and are assigned to the state in which the largest (or larger) primary center is located. Only the Chicago area has centers in three states.

‡ In column (3) the number of primary centers for each state are shown. This number includes the number of prime-primary centers, if any, for each state; the latter are set forth separately in column (4). It should be clearly understood that the 87 prime-primary centers are included in the 1,090 primary centers as the former is merely a special case of the latter. Every prime-primary center is a primary center. The number of secondary centers for each state has not yet been tabulated.

rendered by physicians, the several hundred helpers were advised to use the flow of dollars paid to physicians as the measure of the flow and direction of medical trade. This summation is not ideal for medical services, but it is the measure used in most trading area studies.

WORK DONE BY STATE SOCIETIES

Students of marketing will appreciate the difficulties in designating the primary centers. The first step was to assume *a priori* that each county contained a primary center. On the basis of that assumption we asked and obtained from a good many county medical societies maps circumscribing the territory served by the members of the county medical society. In practically all instances the area was larger than the county, sometimes larger than several counties. The second step was to ask the state medical societies to designate the primary medical service centers. The secretary or, much more often, the executive secretary of the state medical society assumed this task. By means of voluminous correspondence and many personal conferences the list of primary centers was finally agreed on. During these discussions and in the correspondence, we made considerable use of other trading area studies—particularly those of the Curtis Publishing Company[2] and certain marketing area studies by Professor Paul D. Converse of the University of Illinois.[3] The cities of each state were arranged in descending order of population with the number of physicians and hospital beds shown for each city, and the larger centers were designated as primary; some cities not so designated are larger than some of the designated centers. Almost without exception the number of primary medical service centers in each state exceeds the number of primary trading centers per state in any other marketing study which we have examined closely during the past two years. Thus the selection of the primary medical service centers was the most important factor in determining the size, shape and number of medical service areas. In order to avoid the strait jacket of uniformity we did not require a minimum population or minimum number of physicians.

It is not unusual in marketing area studies to designate two and occasionally three centers in a few areas. Our study is peculiar in that we seem to have an unusually large number of areas with two or even three primary medical service centers. At this stage of the study it would appear that such a result really reflects the medical trading habits of the people and the conditions of supply. The number of areas with more than one primary center is somewhat larger than anticipated on the basis of the fine work which has been done in marketing studies by others. It is possible that the procedures followed in making this study have tended to produce this result. Certainly one and one-half centers per area, on the average, do not necessarily lessen the acceptability of the results; they may improve the results.

COUNTIES NOT USED

Several eminent authorities on the subject of trading areas have grouped counties together into areas solely because many of the economic data (retail sales, buying power, population, etc.) were not readily available for pieces of counties. As far as can be determined, authorities on marketing studies do not use counties if the data are available for townships. Fortunately for this study, the Bureau's punch card inventory will provide the necessary detail on physicians by towns with populations of 100 or over; the task of estimating the population of each of these 757 irregularly shaped areas is proving formidable and tedious. Buying power data are not required for population-physician ratios, but their absence from this study would mean that the demand for medical service had not been measured. We may yet attempt to prorate county buying power data to our medical service areas. In no realm of economics can demand be measured by counting the noses of potential buyers; yet counting potential patients per physician has a small degree of validity for limited purposes because of the class price feature of the physician's charges for his services and because of free services that he renders. At least our population-physician ratios for these irregularly shaped nonpolitical areas will be "less worse" than the traditional ratios based on counties. The county is an anachronism even in government.[4] Today the county boundary is no barrier to trade. In particular, the physician is licensed to practice in a state and not in a county. Many of his patients in this day of rapid transportation reside in adjacent counties, adjacent congressional districts or even in an adjacent state. Hence the medical service area provides the only scientific grouping of persons and the physicians who serve them for the purpose of measuring the supply and distribution of physicians.

TO MARKETING AUTHORITIES

Since this study belongs in the field of marketing research as well as in medical economic research, a few comments for students of general marketing problems will orient the results. They will note several features of this map and the data presented in the accompanying table. First, the number of areas, 757, is larger (and the average size smaller) than they would expect.[5] Second, the number of areas with two and even three primary centers is far greater than they would expect. Third, as they would expect, most of the larger areas are in the sparsely populated sections. Fourth, our single set of areas for both the general practitioner and the specialist conceals a number of important marketing factors; most primary centers and some secondary centers contain both. Fifth, the number and extent of medical service area boundaries which coincide with state boundaries will seem excessive to them, for state licensure laws are less of a barrier to interstate medical trading than the understandable tendency of physicians to refer their patients to other physicians in their own state medical society. Sixth, the peculiarities of the medical trading habits of the American people revealed in this progress report will not obscure the close relationship between the medical and the general trading habits of the people in all sections of the county. Seventh, the areas shown on this map will become more meaningful when later superimposed on additional maps showing hard roads, topography, and primary and secondary centers. Eighth, some of these 757 areas do agree rather closely with the areas which would be established by rigid application of Reilly's Law of Retail Trade Gravitation.

[2] Market Areas for Shopping Lines, Research Department, The Curtis Publishing Company, Philadelphia, 1947.

[3] Retail Trade Areas in Illinois, Business Studies no. 4, Bureau of Economic and Business Research, University of Illinois, Urbana, 1946.

[4] These comments regarding the county as an economic unit are not intended as an appraisal of the county as a unit for medical organization.

[5] For example, there are 498 areas in the Curtis study and 613 in the Hearst study (The Trading Area System of Sales Control for Consumer Durable Goods Industries [a map], Hearst Magazines Incorporated, Marketing Division, 1948).

This is a progress report. Some of the boundaries and areas may yet be altered slightly. The list of primary and prime-primary centers is still subject to additions and deletions. Even the final draft will be subject to subsequent changes in a few years because new centers will be created by the federal-state hospital construction program (Hill-Burton Act). All trading habits of the people are subject to change; the boundaries of political areas within the United States rarely change. The Bureau hopes to replace this informed opinion type of survey someday with a statistical sampling type of survey of the medical trading habits of the American people. All that one can say now is this: Every one in the United States lives in one of the 757 medical service areas and there are physicians in each of these areas on whom persons in the area usually depend for their medical care; although some persons live near the border of each medical service area, and some live in counties which have no physicians, none live outside a medical service area.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

National Board of Medical Examiners: *Parts I and II.* Various Centers. June 20-22, Sept. 12-14. *Part II.* April 25-26. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

American Board of Anesthesiology, Inc. *Written.* Various Centers. July 15: Final date for filing application is April 15. *Oral.* April 10-14 and Oct. 16-20. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Ave., New York 27.

American Board of Internal Medicine: *Oral.* Philadelphia, June 1-3. *Written.* Oct. 17. Final date for filing application is May 1. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

American Board of Neurological Surgery: *Oral.* Chicago, June 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

American Board of Obstetrics and Gynecology, Inc.: *Oral.* Chicago, May 8-14. Sec., Dr. Paul Titus, 1015 Highland Building, Pittsburgh 6.

American Board of Ophthalmology: *Oral.* New York, June 11-15; St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

American Board of Orthopaedic Surgery. *Part I.* New York City, April 22-23; Atlanta, Ga., April 29-30; Indianapolis, May 6-7 and Denver, May 13-14. *Part II.* New York City, Jan. 1950. Final date for filing application for Part II is Aug. 15. Address: Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14, Calif.

American Board of Otolaryngology: New York, May 11-14; Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

American Board of Pathology: Boston, April 12-13. Sec., Dr. Robert A. Moore, 507 S. Euclid Ave., St. Louis 10, Mo.

American Board of Pediatrics: *Oral.* Baltimore, May 7-9. Exec. Sec., Dr. John McK. Mitchell, 6 Cushman Rd., Rosemont, Pa.

American Board of Physical Medicine. Philadelphia, June 4-5. Sec., Dr. R. L. Bennett, 30 N. Michigan Blvd., Chicago.

American Board of Plastic Surgery: Examinations are given in June and November of each year in the home town of applicants. Sec., Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

American Board of Preventive Medicine and Public Health: Washington, D. C., May 14-16. Sec.-Treas., Dr. Ernest L. Stebbins, 615 North Wolfe St., Baltimore.

American Board of Psychiatry and Neurology, Inc. December, New York City. Sec., Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

American Board of Radiology. Atlantic City, June 2-4. Sec., Dr. B. R. Kirklin, 102-110 Second Ave., S.W., Rochester, Minn.

American Board of Surgery: *Written.* Various Centers, October 26. Final date for filing application is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

American Board of Urology: Feb. 1950. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination.* Montgomery, June 28-30. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

Arkansas:* Little Rock, June 9-10. Sec., Dr. L. J. Kosminsky, Texarkana. *Eclectic.* Little Rock, June 9-10. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

California: *Examination.* San Francisco, June 20-23. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento.

Delaware: Dover, July 12-14. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

District of Columbia: * *Written,* Washington, May 9-10. Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., Washington.

Florida: * *Examination,* Jacksonville, June 26-28. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

Georgia: *Examination.* June 8-9, Atlanta and Augusta. *Reciprocity.* Atlanta, June. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

Guam: *Endorsement.* Agana, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam. % F.P.O., San Francisco, Calif.

Hawaii: * *Examination.* Honolulu, July 11-14. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu.

Idaho: Boise, July 11-13. Sec., Miss Estella S. Mulliner, Bureau of Occupational Licenses, 355 State House, Boise.

Illinois: Chicago, April 12-14. Supt. of Registration, Mr. Fred W. Ruegg, Capitol Bldg., Springfield.

Indiana: *Examination.* Indianapolis, June 21-23. Sec. Board of Medical Registration and Examination. Dr. Paul R. Tindall, 416 K. of P. Bldg., Indianapolis

Iowa: * *Examination.* Iowa City, June 13-15. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

Kansas: Kansas City, June 1-2. Sec., J. F. Hassig, 905 North 7th St., Kansas City, Kans.

Kentucky: *Examination.* Louisville, June 15-17. Sec., Dr. Bruce Underwood, 620 S. 3rd St., Louisville 2.

Maryland: *Examination.* Baltimore, June 21-24. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homeopathic.* Baltimore, June 14-15. Sec., Dr. John A. Evans, 612 West 40th St., Baltimore.

Minnesota: * Minneapolis, April 19-21. Sec., Dr. J. F. Du Bois, 230 Lowry Medical Arts Bldg., St. Paul 2.

Mississippi: Jackson, June 21-22. Asst. Sec., Dr. R. N. Whitfield, State Board of Health, Jackson.

Missouri: *Examination.* St. Louis, May 30-31 and June 8-10. Exec. Sec., Mr. John A. Hailey, Box 4, Jefferson City.

Nebraska:* *Examination. Omaha, June 6-8. Dir., Bureau of Examining* Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9.

Nevada: Carson City, May 2. Sec., Dr G. H. Ross, 112 N. Curry Street, Carson City.

New Jersey: *Examination.* Trenton, June 21-24. Sec., Dr. E. H. Hallinger, 28 West State Street, Trenton 8.

New Mexico: * Santa Fe, April 11-12. Sec., Dr. V. E. Berchtold, 141 Palace Ave., Santa Fe.

New York: Albany, Buffalo, New York and Syracue, June 28-July 1, Sec., Dr. Jacob L. Lochner, 23 South Pearl St., Albany.

North Carolina: *Endorsement.* Pinehurst, May 9. *Examination.* Raleigh, June 23-25. Sec., Dr. Ivan Procter, 226 Hillsboro St., Raleigh.

North Dakota: * *Written,* Grand Forks, July 5-7. *Reciprocity,* Grand Forks, July 8. Sec., Dr. C. J. Glaspel, Grafton.

Oklahoma: * Oklahoma City, June 8-9. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

Oregon: * *Endorsement.* Portland, April 29-30. *Examination.* Portland, July. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg., Portland.

Pennsylvania: *Examination.* Philadelphia and Pittsburgh, July. Acting Sec., Mrs. B. G. Steiner, 351 Education Bldg., Harrisburg.

Puerto Rico: San Juan, Sept. 6-10. Sec., Dr. Luis Cueto Coll, Box 3717, Santurce.

Rhode Island:* *Examination.* Providence, July 7-8. Chief, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

South Carolina: *Examination.* Columbia, June 27-29. *Endorsement.* Columbia, May 2, June 27-28, Aug. 1, Sept. 5 and Oct. 3. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

South Dakota: * *Examination.* Pierre, July 19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

Texas: *Examination* Austin, June 16-18. Sec., Dr. M. H. Crabb, 209 Medical Arts Bldg., Fort Worth 2

Utah: *Examination.* Salt Lake City, July. Sec., Dept of Registration. Miss Rena B. Loomis. 324 State Capitol Bldg., Salt Lake City.

Virginia: *Examination.* Richmond, June 17-18. *Reciprocity.* Richmond, June 16. Dr. K. D. Graves, 631 First St., S.W., Roanoke.

Washington: *. Seattle, July. Sec., Mr. Edward C. Dohm, Department of Licenses, Olympia.

Wisconsin: * *Examination.* Milwaukee, June 28-30. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

Wyoming: Cheyenne, June 20. Sec., Dr. Franklin D. Yoder, Capitol Bldg., Cheyenne

---

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Arkansas: *Examination.* Little Rock, May 3. Sec., Mr. L. E. Gebauer, 1002 Donaghey Bldg., Little Rock.

Colorado: *Examination.* Denver, June 1-2. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver.

Connecticut: New Haven, June 11. Exec. Asst., State Board of Healing Arts, Miss Mary G. Reynolds, 110 Whitney Ave., New Haven 10.

District of Columbia: *Examination.* Washington, April 18-19 Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., Washington.

Florida: *Examination.* Gainesville, June 11. Sec., Mr. M. W. Emmel, University of Florida, Gainesville.

Iowa: *Examination.* Des Moines, April 12. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

Michigan: *Examination.* Detroit and Ann Arbor, May 13-14 Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing 15.

Minnesota: *Examination.* June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

Oklahoma: April 15. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

Oregon: Portland, June 18, Sept. 3 and Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

South Dakota: Vermillion, June 3-4. Dr. G. M. Evans, 310 E. 15th St., Yankton.

Tennessee: Memphis, July 8-9. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis 3.

Wisconsin: Milwaukee, June 4. Sec., Prof. W. H. Barber, Ripon College, Ripon.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Alabama State Medical Assn. Journal, Montgomery

*Para-Aminobenzoic Acid in Treatment of Rocky Mountain Spotted Fever. L. E. Fraser, H. Rosenblum and J. A. Danciger.—p. 493.
*Detection of Mild Types of Mediterranean (Cooley's) Anemia. C. H. Smith.—p. 505.
Rooting Reflex in Newborn Infant: Incidence and Effect on It of Sleep. Elizabeth F. Gentry and C. A. Aldrich.—p. 528.
Psychologic Management of Children with Glomerular Nephritis. E. C. Persike and R. W. Lippman.—p. 540.
Congenital Pneumonitis in Newborn Infants. J. M. Adams.—p. 544.
Tuberculosis in Children. O. Auerbach.—p. 555.
Large Solitary Pancreatic Cyst and Other Developmental Errors in Premature Infant. Cornelia de Lange and Tieline A. E. Janssen. —p. 587.
Gargoylism (Lipochondrodystrophy): Review of Clinical Observations in 18 Cases. W. A. Reilly and S. Lindsay.—p. 595.

Para-Aminobenzoic Acid in Rocky Mountain Spotted Fever.—Fraser and his co-workers state that 4 of 6 children with Rocky Mountain fever were treated with para-aminobenzoic acid. Three of the treated children, for whom therapy was begun on the eighth or ninth day of illness, responded rapidly. The drug was considered of definite value for these children. A child whose treatment was instituted on the thirteenth day died. The authors do not agree with previous reports that para-aminobenzoic acid is a drug of low toxicity, since in 1 of these children extreme acidosis developed. It is true that the blood level of the drug was extremely high. Administration of an adequate amount of base in some form is recommended, with careful following of the blood levels, urinary findings and carbon dioxide–combining power. The complications of delirium and mental confusion probably are due to varying degrees of acidosis rather than to the drug per se, although the disease itself may produce delirium and acidosis. An incidental observation of a reducing substance in the urine is reported. The authors say that since they wrote this article sodium salt of para-aminobenzoic acid has become available. This compound was used in later cases, and acidosis was not noted. A convenient dosage plan was outlined by Ravenel, who recommended administration of 0.5 to 1 Gm. per pound of body weight per day in divided doses, depending on the size of the child, larger patients receiving the smaller and smaller patients the larger dose.

Mediterranean (Cooley's) Anemia.—While severe forms of Mediterranean anemia are readily diagnosed, the milder form is usually overlooked. The report by Smith was prompted by the increasing frequency with which this milder type has been encountered in the Children's Clinic of the New York Hospital and by the probability that it is also prevalent in other communities with large Mediterranean populations. Carriers of this trait constitute a potential source for the hereditary transmission of the disease. This study is based on the results of examinations of the blood of 181 persons in forty-seven families with Mediterranean anemia (familial erythroblastic anemia). It demonstrates the frequency of the mild form of this disease. While the roentgenographic changes and severe clinical manifestations that characterize the severe form of Cooley's anemia are absent in the person with the mild form of the disease, the changes in the blood are distinctive and readily demonstrable. In these persons polycythemia may occur, with normal or lowered hemoglobin levels, and basophilic stippling may be sufficiently pronounced to suggest lead poisoning. The data presented support the hereditary principles that in no family with an affected child were both parents free from the disease and that in every case of a severely anemic child's requiring periodic transfusions both parents revealed abnormalities of the blood. In every one of the sixteen families with a severely anemic child both parents bore the trait for the disease. Since appropriate laboratory procedures permit the differentiation of the carrier from the normal persons, it may be possible with more extensive experience to furnish genetic information concerning the likelihood of the occurrence of the severe type of this disease in future pregnancies.

Peripheral Inoculation of Lansing Poliomyelitis Virus in Rodents: Susceptibility and Development of Immunity. M. R. Pinto.—p. 361.
Experimental Studies of Variables in Neutralization Tests with Lansing Poliomyelitis Virus. E. J. Bell.—p. 381.
Immunization of Monkeys with Formalin-Inactivated Poliomyelitis Viruses. Isabel M. Morgan.—p. 394.

Antibody Response to Influenza A Infection.—Analysis of data pertaining to the antibody response to infection during the 1943 epidemic of influenza A indicated that agglutination-inhibition titers to influenza virus A began to increase, as a rule, within ten days after the onset of illness. Maximum titers were reached during the second or third week after onset. Titers were generally at their height near the twentieth day and remained at or near their highest level for at least a month. Average antibody titers fell three to six months after onset, but were still above the initial level one hundred days after onset in 30 patients, and a year after illness in 4 patients. During the epidemic period 3 patients were observed with serologic evidence of infection with influenza virus B and 1 patient with evidence of simultaneous infection with influenza viruses A and B.

Distribution of Influenza A Virus.—In a study of the distribution of influenza virus A during and after an epidemic, the agent was demonstrated only in throat washings from persons who had some clinical evidence of respiratory illness and whose serums showed an increase in antibodies to influenza virus A. Examination of washings from hospitalized patients and well soldiers lacking an antibody response failed to give evidence of the presence of the virus. The agent was detected in 28 of 46 patients whose illnesses were serologically diagnosed as influenza, and in 2 of 15 soldiers in the field whose serums showed an antibody response. There was no striking difference in the frequency of detection of virus in washings from persons with a slight increase in antibody titer in comparison with those from subjects showing a decided increase in titer. Embryonated eggs being used, virus was not detected in washings collected more than six days after the onset of illness. In contrast, evidence was obtained, by inoculation of animals, for persistence of virus in the throat for seven to thirty-five days after the onset of influenza. Further confirmation is required, since the possibility of cross infection in some of them cannot be excluded.

Anicteric Hepatitis: Report of 9 Sporadic Cases. H. J. Zimmerman and L. J. Thomas.—p. 545.
*Ornithosis (Psittacosis), Review with Report of 8 Cases Resulting from Contact with Domestic Pekin Duck. W. Wolins.—p. 551.
Postvaccinal Encephalitis: Report of 45 Cases in New York City. M. Greenberg and E. Appelbaum.—p. 565.
Roentgenologic Manifestations of Scleroderma. D. G. Pugh.—p. 571.
Treatment of the Leukemias. G. L. Kauer Jr.—p. 581.

Esophageal Electrocardiograms.—Burchell points out that when typical electrocardiographic QRS patterns exist, wherein the left leg is initially negative to both the right arm and left arm with a resulting Q_2 and Q_3, the picture may be diagnostic of a previous infarction located in the posterior or diaphragmatic wall of the heart. When only a deep Q_3 is present, interpretation of it in respect to previous infarction tends to become a question of statistical probability. Experience at the Mayo Clinic with esophageal electrocardiography in attempting to elucidate the Q_3 problem has been scattered over the past ten years. The conclusion has been reached that electrocardiograms made with the electrode in the lower part of the esophagus and stomach are sometimes of great value in confirming a diagnosis of healed posterior myocardial infarction, but sometimes they are normal or are not definitely diagnostic even when the heart is known to contain a scar in the posterior myocardial wall. Esophageal electrocardiograms which might be regarded as diagnostic of old posterior myocardial infarction, particularly those with QS deflections followed by a deeply inverted T wave, have usually been associated with a suggestive or diagnostic Q_2Q_3 pattern in the standard leads in this study. When esophageal leads are used to elucidate the clinical significance of a deep Q_3 in cases in which such a Q_3 is the only finding leading to the suspicion of previous myocardial infarction, the findings are frequently of equivocal nature.

Premature Beats in Angina Pectoris.—In the test described by Porter the patient is required to exercise only sufficiently to reproduce the subjective symptoms from which he is seeking relief. This exercise procedure is carried out under the supervision of a trained observer. Its type and duration vary greatly from patient to patient, depending on the exercise tolerance of the individual. Electrocardiograms are made before, during and after induced attacks of the primary complaint. No accidents have resulted from these studies. The most significant change in the electrocardiograms in attacks of induced angina pectoris has been the occurrence in 4 patients of premature ventricular beats. With one exception these 4 patients had few signs of cardiovascular disease, and resting electrocardiograms were equivocal in all 4. Premature beats occurring at the peak of induced angina and cardiac acceleration were the most significant changes in the electrocardiogram. The ectopic beats and pain disappeared with rest and cardiac slowing. In 2 of the patients exercise tolerance was greatly increased by quinidine sulfate, which prevented the occurrence of premature beats with effort. It is suggested that the occurrence of premature beats, especially pulsus bigeminus in an episode of effort angina, may have grave prognostic significance. Quinidine sulfate can profitably be used in the type of patients under discussion. The dose must be conservative, 0.2 to 0.4 Gm. three times daily equally spaced during the period of physical activity.

Ornithosis Following Contact with Domestic Pekin Duck.—Wolins says that the prediction by Meyer and Eddie that barnyard fowl may be a reservoir of ornithosis is fulfilled in this communication in which all but 1 of the 8 clinical patients were in intimate contact with the domestic duck. These birds are grown in tremendous numbers (7,000,000 annually) on a number of farms located in the eastern end of Long Island. Mild or moderate illness predominated, and there were no deaths. Evidences of a frank pneumonic process are not necessarily the accompaniment of infection, nor is there any direct correlation between the severity of the illness and the changes in the chest. The epidemiologic background of the clinical material suggests that immunity to ornithosis develops in many perons after long exposure or latent infection and that the immunity so acquired may wane unless there is constant reexposure. Penicillin in doses of 50,000 units every three hours was sufficient to produce prompt recovery in 4 out of 6 patients.

Impaired Cerebral Functions in Chronic Brucellosis.—This report by Apter and his associates is based on studies of 10 patients with brucellosis who were evaluated by the internist, neuropsychiatrist and experimental psychologist. Four case histories which point up characteristic changes in the 10 patients are presented. Patients with brucellosis with severe personality changes may also have a measurable impairment of intelligence. The degree of impairment for some is comparable with that seen in patients with surgical removal of the prefrontal lobes. The clinical patterns in the first 3 cases reveal measured impairment of biologic intelligence and a deterioration of adaptive capacities or ego functions. Evidence for disturbances in ego functions were obtained by three methods: the clinical psychiatric, by which changes in social relations were evaluated in respect to the basic personality structure; the neuropsychologic, by which biologic intelligence was quantitatively estimated, and the internist's evaluation, by which the primary diagnosis was established and the possibility rendered remote that other concurrent diseases were responsible for the observed brain damage. The patients with chronic brucellosis who have deficiencies in biologic intelligence may present a distinct clinical picture. They complain of headache, easy fatigability, inability to return to work, loss of former skills, insomnia and decreased ability to adapt in social situations. Their psychiatric state is characterized by defects in the intellectual sphere, impoverished emotional expression, reduction in motility, inability to plan for the future and failure to establish ordinary rapport.

Chemotherapy in Wounds and Surgical Infections.—Ackman and Smith dealt in a previous report with contamination of fresh wounds and preexisting infections with gram-positive pyogenic bacteria. In this paper they discuss the significance of gram-negative pathogens in fresh trauma and preexisting infections as reflected in clinical and bacteriologic studies on 54 patients from the surgical wards of the Montreal General Hospital. They stress that gram-negative pathogens are not frequent contaminants, since only 26 cases with such contaminants were detected in over 250 cases of fresh trauma and 28 cases in over 300 surgical infections. They are most often found in lesions of the lower extremities. In fresh trauma, despite their persistence, these organisms show almost no tendency toward invasive infection when sound wound management is applied and circulation is adequate. Consequently delayed revision surgery and skin grafting may be done with relative impunity. In preexisting surgical infections with gram-negative pathogens, revision grafting or surgery is almost equally immune when local and general physiologic conditions are satisfactory, even though contamination be gross. Adequate blood supply and all other physiologic conditions should be zealously protected in every wound or surgical infection. These physiologic conditions are well maintained locally by occlusive compression dressings that are infrequently changed. The authors believe strongly in the role played by these dressings in wound healing. Such bacteriostatics and antibiotics as they have used topically, including sulfathiazole, penicillin and streptomycin in cream bases, have failed to eliminate gram-negative pathogens in 54 cases of fresh trauma and surgical infections. Streptomycin in a cream base has quickly and regularly caused "fast" organisms in 4 instances. Contrary to these results the authors have been greatly encouraged in this work by these more recent experiences with streptomycin. When invasion by gram-negative organisms does occur, intramuscular administration of streptomycin has given encouraging results in a few instances so far observed. The authors have seen an apparent synergistic effect between penicillin and streptomycin in 1 instance.

Venous Thrombosis and Pulmonary Embolism Following Injury to Extremities.—Aurin and Herrmann observed that the incidence of venous thrombosis in patients who have sustained injury to the legs is almost 12 per cent, while venous thrombosis in general surgical patients is only about 2 per cent. They review observations on 92 patients with fractures of the pelvis or lower extremity who were admitted to their hospital in the course of three months. Among this group there were 12 cases of venous thrombosis with or without pulmonary embolism. These 12 cases are analyzed. They feel that the real solution to the problem lies in the prevention of venous thrombosis rather than in limitation of the process. It is most important, therefore, to examine each patient carefully for evidence of venous thrombosis so long as he remains bedridden. Among patients with fractures of the lower extremities there are many elderly persons who are particularly susceptible to the development of venous thrombosis. Since the occurrence of deep venous thrombosis is so closely related to inactivity and recumbency, early and continued active motion while the patient is still in bed is an important prophylactic measure. Measures preventive of stasis of blood in veins of the lower extremities such as frequent change of position, elevation of the foot of the bed and, most important, movement of the muscles of the lower extremities must be carried out. Once peripheral venous thrombosis has occurred, early recognition of its presence is essential to proper therapy. Its limitation to the affected extremity and the prevention of pulmonary embolism are best accomplished by the use of anticoagulant therapy.

Aluminum Foil in Burn Therapy.—Brown and his associates show that aluminum foil, at a thickness of 0.001 inch, can readily be molded on the contours of the body. Thicker foils were found to be more unwieldy. On the other hand, foil as thin as 0.0004 inch has been used and, although it could be applied with ease, fragmentation occurred, with the result that its removal piece by piece from the burn surface on the tenth day was tedious. All foils were permeable sheets; holes transmitting light could be seen when a sheet was held up to light. The application of aluminum foil to the burn surface is performed as follows: 1. After adequate sedation, the burn area is cleansed with 1 per cent aqueous cetyltrimethylammonium bromide (cetavalon®); sluiced clean with saline solution and blotted dry with a sterile towel. 2. Dry aluminum foil which has been sterilized by autoclaving is smoothed by hand onto the burn surface. 3. The routine pressure dressing is then applied over the foil. Aluminum foil has been used as the initial dressing for burns in 50 cases. For comparison portions of the burn surface of 9 patients treated with aluminum foil were covered with one of four other metals. The local results at ten days in 8 cases were equal to the remaining areas covered with aluminum foil. The gold and silver leaf was found to be fragmented and adherent to the dressings or the burn surface. Aluminum foil diminishes the maceration of a burn surface. The method appeared to facilitate the dispersion of exudate to the periphery of the burn. No evidence of toxicity was found. Titanium dioxide exposure cream as a burn ointment was irritating; it produced pain, delay in healing and possibly caused destruction of epithelial remnants. Massive doses of ascorbic acid administered to burn patients quickly corrected the ascorbic acid depletion, but the systemic reaction to thermal burns was not changed by this treatment. Blood glutathione levels were not influenced by thermal burns and bore no consistent relationship to changes in serum ascorbic acid levels.

Electric Burns of Head with Residual Damage to Eyes and Brain.—North shows that even though voltage may be known the actual quantity of current (amperage) cannot be calculated in a case of electrical injury because of the wide range of the resistance offered by different body tissues. Survival of the patient is determined more by the path which the current takes through the body than by its intensity. There is general agreement that a current passing through the chest is most likely to be lethal, because of its effects on the heart. The 26 year old man whose case is reported by North was on the roof of a house which was being moved, fending off overhanging electric wires. It appears that he was grasping a metallic strip along the ridge of the roof with his left hand. A wire, carrying a current of 7,200 volts, made contact with the metal strip. The patient later recalled a blinding flash and believed that as he recoiled the back of his head touched a second high tension wire. The patient sustained a severe electric burn of head and arm. Although his left arm had to be amputated at the shoulder he survived the injury. The burn on the back of his head was grafted. Virtually the entire occipital bone sequestrated and was removed. Bilateral cataracts and optic nerve atrophy developed. The brain underlying the burned area was injured, leaving him with obvious but diminishing residual damage to the occipital lobe, cerebellum and parietal cortex. Despite improvement with the passage of time, some of these residual changes are expected to be permanent.

Conditions Mistaken for Coronary Occlusion and Angina Pectoris.—Sprague states that while the electrocardiograph has added immeasurably to our ability to recognize myocardial infarction, in inexpert hands it has been overused to diagnose coronary disease on the basis of nonspecific changes which occur with infections, with a multitude of disturbances in vagosympathetic balance and in metabolic, chemical, nutritional and other disorders. Coronary artery disease, by definition, implies that its victim is potentially in danger of sudden death, whereas this is rarely true of the conditions mistaken for angina pectoris and other gradations of coronary insufficiency, including myocardial infarction. The author cites a report by Herrick in which twenty-eight conditions were listed that had been confused with coronary occlusion. Sprague is concerned chiefly with the following: pulmonary embolism, acute pericarditis, dissecting aortic aneurysm, ectopic cardiac rhythms and cerebrovascular attacks. As conditions confused with angina pectoris he mentions: (1) herpes zoster with pain preceding the skin eruption by several months; (2) cardiospasm, often aggravated by tobacco; (3) esophageal ulcer and (4) cardiac neurosis. A careful history is more important than any test in the diagnosis of angina pectoris, or other gradation of coronary insufficiency, short of that producing electrical disturbances in heart muscle. Beyond the critical limits of myocardial ischemia which is reflected by electrocardiographic abnormalities, the clinician must, if possible, determine the amount of heart damage attributable to coronary disease and that due to the temporary acute insult, such as pulmonary embolism, hemorrhage, severe exertion, abnormal rhythm, anoxia or other disturbance of coronary equilibrium. The greater the strain on the circulation, the less the underlying coronary disease that need be predicated when the electrocardiogram indicates myocardial anoxia.

Surgical Intervention in Hemophilia.—Craddock and his associates call attention to the fact that there is lack of unanimity of opinion as to the best course to follow in patients with hemophilia in whom acute surgical conditions develop. After a review of the literature, the authors present the history of a patient, aged 27, who had hemophilia and required an operation for appendicitis. This patient died four days after operation in spite of intensive antihemorrhagic therapy. Necropsy revealed pulmonary edema, bilateral hemothorax and a large blood clot in the appendical bed extending along the right peritoneal gutter from the pelvis to the liver. There was also an extensive hematoma at the site of the abdominal wound, not communicating with the peritoneal cavity. The mortality following internal surgery in established cases of hemophilia is relatively high. Of 4 previously reported patients in whom the diagnosis of hemophilia was unequivocal, 2 died from hemorrhage following operation, while 2 recovered. The other eleven reports of internal surgical procedures in patients with bleeding tendencies were excluded from this analysis because of inadequate basis for the diagnosis of hemophilia. If these were included, the total number of recoveries following operation would be 11 with only 4 deaths, or a mortality rate of 26.7 per cent, a figure the authors believe to be erroneously low. They discuss the significance of continued hemorrhage in the presence of a normal in vitro clotting time and of its relation to the fundamental defect in hemophilia. Emphasis is placed on the failure of the coagulation time to indicate the severity of the hemorrhagic tendency or the degree of response to treatment, the difficulty in choosing a suitable case for operation and the great difference in controlling internal hemorrhage as opposed to bleeding from an external site.

Reduction of Intussusception by Barium Enema.—Ravitch and McCune direct attention to the high mortality rate resulting from the surgical treatment of intussusception. Describing the barium technic, they say that as soon as the presumptive diagnosis of intussusception is made, the child is taken to the fluoroscopic room. At the same time, the operating room is alerted. Without anesthesia, an unlubricated Foley bag catheter is inserted in the rectum. The bag is distended with 20 to 40 cc. of air according to the size of the patient, and barium is permitted to run in from a height of 3 feet (91.4 cm.). It is important not to lubricate the catheter, as it will then be more easily retained. It is essential for an assistant to squeeze the buttocks together throughout the procedure. The barium usually runs rapidly to the intussusception, which it outlines, producing a concave meniscus. The ends of the meniscus extend proximally until suddenly the intussusceptum gives ground. The meniscus flattens out, then begins to deepen again, and so on. This may take place quickly. At other times there is a stubborn hang at one level or another and then sudden progress. The chief difficulty may be in deciding on completeness of reduction at the cecum. By displacing the cecum laterally one may see barium well up in the small bowel. If complete reduction is not achieved, the child is permitted to expel the enema and the effort is repeated. If the third such injection is unsuccessful, operation is performed. The authors stress that reduction by hydrostatic pressure is a safer primary intervention in intussusception than is surgical treatment.

The Silent Gallstone: Study of 112 Cases.—Comfort and his associates found wide divergence of opinion and a lack of accurate data in the literature on the problem of the silent gallstone. In the hope of supplying some of the data not now available but necessary for the decision regarding treatment of the silent gallstone, a long term follow-up study of all cases in which gallstones were found incidentally during the course of some other abdominal operations at the Mayo Clinic was carried out. The records of 998 such cases were reviewed. Many of these were discarded as unsuitable for a long term follow-up, because the operation had been for cancer. Many others, including those with duodenal ulcer, were discarded because some of the abdominal symptoms might have been due to the cholelithiasis. Follow-up letters were sent to 184 persons. Replies were received from 115. One hundred and twelve cases were considered suitable for study. In 61 cases no symptoms developed. In the 51 cases in which symptoms occurred, 30 patients complained only of dyspepsia and 21 experienced painful seizures. Five of the 21 patients experiencing painful seizures also had jaundice. Cholecystectomy may be advised but need not be urged, if the patient prefers to accept the chance of experiencing painful seizures or the increased risk of surgical treatment in the event the complication of calculous disease of the biliary tract appears. Many patients will prefer to have gallstones removed in order to eliminate the threat of painful seizures or severe complications. Others, knowing the higher risk of surgical intervention should complications develop, will prefer to take the chance that no symptoms will develop. Surgical treatment of the silent gallstone may be classified as optional or elective surgery, but surgical intervention should not be postponed after symptoms, and more especially after attacks of colic appear.

Ammoniacal Silver Nitrate in Fungous Infections of Nails.—Nickerson and White show that the results of treatment of fungous infections of the nails or onchomycosis have been disappointing, although many medicaments and methods have been tried. While conducting experimental work on the physiologic aspects of pathogenic fungi, Nickerson conceived the idea that the problem might be solved by the use of a substance that was fungicidal and which also could penetrate keratin. Such a substance was found in ammoniacal silver nitrate. Penetration by the ammoniacal silver nitrate was demonstrated by roentgenograms of the nails and by histologic study. Patients with fungous infections, proved by scraping and by culture, were treated with weekly applications of an ammoniacal silver nitrate solution. No unfavorable reactions were noted. Nine of 16 patients have been cured. "Cure" is demonstrated by the growth of normal-appearing nail tissue and normal mycologic observations. The remaining 7 were definitely improved and, as of the date of writing, continued to receive treatment. Because of the highly unusual property of penetrating nail tissue, reaching the nail bed and thus exerting direct fungicidal action on the hitherto unapproachable fungi, ammoniacal silver nitrate appears to offer a better prospect for cure of these extremely stubborn conditions than any previous method of treatment.

Tocopherols (Vitamin E) in Lupus Erythematosus.—With the knowledge that the administration of tocopherols (vitamin E) had demonstrated an ability to regenerate collagenous tissue in a case of noduloulcerative granuloma with lipoidal deposits, indistinguishable from necrobiosis lipoidica diabeticorum, it seemed logical to Burgess and Pritchard that certain other entities which have been grouped as diseases affecting primarily collagenous ground substance should be investigated and treated in similar manner. Eleven of the cases of lupus erythematosus treated by the authors have been described in some detail, because of observations resulting from close and frequent clinical and histologic studies made during tocopherol therapy. Other patients, 25 in all, have been similarly treated, and the pattern of response to treatment was similar in that some favorable curative effects have been obtained. Superficial lesions clear up more quickly with this form of treatment. Deep infiltrative lesions require more intensive and prolonged treatment, and the results, while not so spectacular as in the superficial type of disease, are progressive.

Intramural Deposits of Lipids in Cholecystitis.—Weismann and McDonald say that although less frequent in occurrence than cholesterosis, or "strawberry gallbladder," large intracellular deposits of lipoid materials are not uncommonly observed in the subserosal layers of diseased gallbladders. This study is concerned with a review of the clinical data and examination of the tissue removed at operation at the Mayo Clinic in 23 cases of inflammatory disease of the gallbladder. The presence of advanced complicated inflammatory lesions of the gallbladder in these 23 cases was not associated preoperatively with corresponding clinical evidence of a severe infection or a purulent intra-abdominal disorder. Furthermore, except for the 1 postoperative death, infection or sepsis did not complicate the recovery from the surgical procedures. The local lipid disturbances in the walls of the gallbladder were associated with active perforating purulent lesions, but there was not clinical evidence of significant bacterial activity. Obstruction of the cystic duct with resultant stasis or imprisonment of bile occurred in most, if not all, of these cases. In addition to many of the usual histopathologic changes seen in inflammation of the gallbladder, the 23 specimens revealed excessive deposits of lipids in either an intramural or a pericholecystic location. For the most part, the lipid deposits occurred in large mononuclear phagocytes or giant cells. The lipids were associated with three types of histopathologic pictures, namely, a xanthomatous granulomatous reaction, fat necrosis and intramural areas of dense cellular infiltration with necrosis and "abscess" formation. The histopathologic evidence is suggestive of a chemical origin of the cholecystitis and would explain the paucity or absence of clinical signs of infection or sepsis. Chemical determinations of lipid fractions of the tissues from 5 of the gallbladders indicated that the cholesterol and the cholesterol esters were increased. When fat necrosis predominated, there was an increase in the fatty acid fraction. When the other characteristic lipid lesions were seen, the fatty acid fraction was only slightly increased.

Craniolacunia.—According to Wyatt and Goldenberg craniolacunia is an abnormality affecting fetal skulls and is characterized by a variable netlike or arborizing pattern of bony ridges, which sharply delineate and separate small rounded depressions or defects on the inner surface of the bones of the cranial vault. Synonyms for this condition include "relief skull," "trabecular skull," "lacunar skull" and "cranial lacunous osteogenesis." Reviewing the earlier literature, the authors call attention to the frequent association of this condition with meningocele and with the Arnold-Chiari malformation. At the authors' hospital craniolacunia has been observed at necropsy in 6 of 62 stillborn and neonatal infants in one year, when a total of 2,757 deliveries took place. Four of the 6 infants found to have craniolacunia were stillborn. All of the 6 infants were girls. The diagnosis of craniolacunia is made either during life by roentgenographic studies or at necropsy by direct inspection, by transillumination or by use of postmortem roentgenography. The skull, on postmortem examination, may show widened sutures or fontanels and may feel plastic. The areas of rarefaction, the lacunas, give rise to an arborizing network of ridges. The presence of defects in brain and cord should evoke closer examination of the skull to demonstrate craniolacunia. The pathologic investigation of stillbirths and neonatal deaths tends to be cursory. Therefore, reports of the morbid anatomy of lacunar skull and associated anomalies are scanty. A more detailed necropsy study of this group may possibly reveal a greater incidence of neuroembryologic defects and shed further light on the histologic aspects and the causation.

Dietary Factors and Hepatic Injury.—Sellers reviews recent observations concerning the role of nutrition in the development of hepatic lesions. It is possible to produce cirrhosis by prolonged feeding of diets low in choline and in the substances from which it is synthesized. Moreover, dietary deficiency in sulfur-containing amino acids such as cystine and methionine is capable of producing massive lobar necrosis in rats. This is not a consistent result, and the relationship of methionine and cystine to the disease is not clear. At present their lack must be regarded as a contributory rather than a causal factor. A remarkable degree of repair may take place in experimental cirrhosis produced by carbon tetrachloride. Choline or its precursors are necessary in the repair process. There is no evidence that combinations of the lipotropic factors or increased total intake of these substances causes a greater degree of recovery than the presence of an adequate amount of a single lipotropic factor in an otherwise adequate diet.

Visceral Manifestations of Lupus Erythematosus.—Hertzman and Munroe point out that when the presenting lesion of lupus erythematosus is in the skin, the diagnosis is comparatively simple, but it should be remembered that the initial symptoms may be arthritis, fever, pleurisy or lymphadenopathy. Proved cases of this type are not frequent even in large general hospitals. The 11 cases reviewed in this report were seen in the course of three and one-half years at the Vancouver General Hospital. The youngest patient was 17, and the oldest 49 years old; 6 were in their twenties. The sex ratio is generally about 5 to 1 in favor of women. In this group of 11 cases there was only 1 male. The onset is usually insidious, and the course may be marked by remissions and exacerbations. The remissions may last months. In this group the average duration between onset of symptoms and death was twenty months. The shortest was five months; the longest was three and one-half years. The diagnosis of disseminated lupus erythematosus may be extremely difficult, especially before skin lesions are present. Joint pains are likely to be confused with rheumatic fever or rheumatoid arthritis. Patients presenting a fever of unknown origin and leukopenia bring many conditions into the differential diagnosis. These include tuberculosis, the typhoid group and undulant fever. Roentgenologic and laboratory examinations will exclude these. Subacute bacterial endocarditis will be considered, but blood cultures are sterile in disseminated lupus. Secondary syphilis may have to be excluded where generalized lymphadenopathy is associated with fever and a skin rash. A positive blood Kahn reaction adds to the difficulties. Differentiation will be based on the lack of exposure or primary lesion, and the low titer of the Kahn reaction. The urinary findings have to be differentiated from those of glomerulonephritis. The causation of disseminated lupus erythematosus remains obscure. Direct exposure to sunlight and the injection of allergenic substances such as tuberculin are to be avoided. Gold therapy is contraindicated. Once the disease is established therapy is purely symptomatic.

Anuria Following Electroshock Therapy.—Clute and FitzGerald report the case of a man, aged 59, who was subjected to electroshock therapy with a dose of 110 volts and 450 milliamperes for 0.3 second. The patient had a typical grand mal convulsion with no immediate complications. The following morning he stated that he had not passed any urine since the shock treatment and complained of aching in the lumbar region and nausea. Catheterization on March 3 disclosed only 1 ounce (30 cc.) of urine in the bladder. Various measures to stimulate urinary excretion were without avail, and the patient died of anuria. The authors observed close similarity of the renal lesions to those seen in the crush syndrome and in a number of other conditions. Cytologic changes in the renal tissue proved insignificant in contrast with the complete renal failure.

Unsuspected Syphilis in Older Persons.—According to Thewlis and Gale unsuspected, unadmitted syphilis is rather common in old age. Syphilis should always be suspected in obscure illness. Tertiary syphilis may show up in persons infected thirty or forty years before. The first signs of hereditary syphilis may not appear until after the age of 50. The serologic and spinal fluid examinations may not yield any clue. Syphilis may cause symptoms suggesting almost any known disease. It may produce a background against which hereditary epilepsy shows up, causing cardiovascular symptoms. Multiple tests for syphilis are essential when diagnosing chronic illnesses. Many conditions may be caused by unsuspected syphilis. Among these are gallstones, peptic ulcer, appendicitis, bronchiectasis, epileptiform seizures, asthenia, hypertension, atrophic or hypertrophic arthritis, carcinoma, disease of the central nervous system, long continuous fever, endarteritis, diabetes and other diseases. Leg ulcers are commonly found. Serologic tests may be baffling. The spinal fluid Wassermann reaction may be positive while the gold curve and other tests remain negative in results. Older clinicians used potassium iodide internally and red mercuric iodide injections. This treatment often proved satisfactory. Penicillin in large doses (5,000,000 to 8,000,000 units in divided doses) may be given to an ambulatory patient. One must always be prepared for a Herxheimer reaction in these cases. It is safer to begin treatment with iodides, then bismuth compound, followed by penicillin. In treating syphilitic coronary artery insufficiency and syphilitic aortitis, iodides and bismuth compound are employed. A fever reaction within twenty-four hours after treatment may be disregarded. The patient must be kept under observation for the remainder of his life. Discovery of old syphilis and proper therapy may prolong life and save much suffering.

Hemoglobin Level in Old Age.—Howell says that whereas in the past many writers have stated that the level of hemoglobin in the blood of old persons is diminished, more recent authors have seen no alteration. The author presents studies on several groups of aged persons, which revealed that old persons are not anemic.

Technic of Prefrontal Lobotomy.—Poppen describes a technic of prefrontal lobotomy which he has used since 1943 in 470 patients. A surgical mortality of 1 per cent indicates its safety. The technic is simple and rapid, but most important is the fact that the white tissue is visualized as it is divided with the electrocoagulation suction unit. Two parallel incisions, usually 4 cm. in length, in a sagittal plane are made in line with the pupil of each eye, extending just to the anterior border of the coronal suture on each side. The scalp edges are retracted and a button of bone, 2.5 cm. in diameter, is removed by means of a special trephine. The dura is opened with a semicircular incision, with the pedicle toward the midline. A wedge of cortex is cleanly excised through each opening, thus exposing the white tissue. A ventricular needle is inserted in the direction of the edge of the lesser sphenoid wing in line with the anterior horn of the lateral ventricle. If the lateral ventricle is normal in size, the needle will just skirt the anterior edge of the anterior horn. In many of these patients, however, the ventricular system is enlarged and the needle may enter the ventricle. In such instances the needle is withdrawn and directed slightly more anteriorly; the point of the needle will contact the orbital plate. The needle track serves as a guide. It is followed with the electrosurgical suction instrument and the white tissue divided in a sweeping motion from side to side. This procedure is performed under direct vision, care being taken that all tiny bleeding points are controlled. All the white tissue is divided on the medial inferior quadrant to the lateral ventricle, and this is completed under direct vision with a lighted brain retractor. The white digitations in the gyri can readily be seen and divided. The incisions made through the white tissue are irrigated to remove bits of fragmented brain. The dura is closed. The bone buttons are replaced and the scalp sutured.

Streptomycin in Type B Hemophilus Influenzae Meningitis.—O'Brian and his associates record the results obtained in 9 consecutive cases of meningitis caused by type B Hemophilus influenzae treated with streptomycin at the Jersey City Medical Center. The intramuscular dose was 20 mg. per pound of body weight per day, divided into eight equal doses, administered every three hours. The intrathecal dose was 25 to 75 mg. daily, given as a single dose. The diluent was isotonic sodium chloride solution, usually 10 cc. Sulfadiazine was used in conjunction with the streptomycin in all cases. Although streptomycin alone has effected cures, the authors do not feel that sulfadiazine should be withheld from these patients. The dosage of sulfadiazine was 1 to 3 grains per pound (0.13 Gm. per kilogram) of body weight per day. The age range of the patients was from 7 months to 3 years, with 7 of the patients under 2 years of age. Eight of the 9 patients recovered. The authors conclude that a combination of streptomycin and sulfadiazine constitutes adequate therapy in the cases of mild and moderate meningitis due to type B Hemophilus influenzae. In cases of severe disease and in patients who do not respond to this therapy, type-specific rabbit serum should also be used.

Sickle Cell Anemia in Adults.—The purpose of this report by Legant and Ball is to describe the roentgenographic findings in 26 cases of sickle cell anemia in adults seen at the Presbyterian Hospital in New York since 1930. Particular attention is given to the appearance of the bones. The roentgenologic aspects reflect the long-standing anemia and the peculiar thrombotic tendency in this disease. The abnormality most frequently found was cardiac enlargement. The abnormalities of the bone observed in this group consisted of: (1) generalized osseous demineralization, 11 cases; (2) a biconcave deformity of the vertebral bodies which is believed to be the result of bone softening, 4 cases; (3) patchy cortical thickening of the long bones, 7 cases, which might be due to infarction, and (4) localized bone infarcts, 5 cases, not unlike those seen in caisson disease. Four of the 26 cases showed nothing abnormal on the roentgenograms. A unique case is reported in which a serial roentgenographic study was made of an infarction of two vertebral bodies from its inception to the healing stage.

Roentgenologic Changes in Sickle Cell Anemia.—Macht and Roman review 48 cases of proved sickle cell anemia indexed in the records of the Baltimore City Hospitals during the years 1936 through 1947. Twenty-nine of the patients were children under 14 years of age. All cases of sickle cell trait (sicklemia) without anemia were excluded from this series. The more common observations have been cardiac enlargement, skeletal disturbances involving the long bones and pneumonia. The roentgen manifestations of changes in bone have been noted to occur later than the clinical findings of heat, swelling and tenderness. These destructive bone changes are transitory and may be missed unless serial roentgen examinations are performed. Since sickle cell anemia is a systemic disease and may manifest itself in many ways, roentgenologic study should be correspondingly complete.

A Study of the Hands of Radiologists.—Braasch and Nickson say that during the annual meeting of the Radiologic Society of North America in 1946 a study of the hands of radiologists was undertaken. The incidence of abnormalities in the finger ridges among radiologists was 48 per cent as compared with 1.8 per cent of an unexposed group. The incidence of ridge abnormality increased with years of exposure to 100 per cent for those who had practiced more than thirty-five years. The use of lead gloves was not a routine practice in most cases. The incidence of ridge abnormality was 48 per cent among those who professed to use lead gloves. Photographing the nail fold area and examining these photographs for abnormalities of the terminal vessels, the superficial vascular plexus and the papillary border of the corium revealed about the same abnormalities as are seen in aged persons without exposure to radiation. The changes appear to be induced at an earlier age among radiologists than among unexposed persons.

Rectal Lymphogranuloma.—Adams and his co-workers treated 62 patients, 60 women and 2 men between the ages of 20 and 55, with rectal lymphogranuloma with stricture formation, by complete excision of the diseased bowel. Forty patients showed only rectal involvement, 11 showed involvement into the sigmoid, 5 involvement from the anus up to the descending colon, 3 involvement as high as the splenic flexure and 3 showed involvement of the rectum and colon as far as the hepatic flexure. This extent of the lesions justifies the point of view that total excision of the involved tissues is the best way to treat these cases. The two stage abdominoperineal operation, as advocated by Lahey, was used in 23 cases. It has proved to be a satisfactory method and is still useful in the depleted patients. There were 14 one stage Miles abdominoperineal resections, which may be preferred to the Lahey operation except in the seriously ill patients. There were 5 deaths among the 62 patients undergoing resection, a mortality rate of 8.1 per cent. Fifty-seven patients survived; 9 of them were followed for less than two years, 23 for two to five years and 22 for more than five years. All are getting along satisfactorily, have gained weight from a few pounds to as many as 140, and are now able to carry on their usual occupations.

Bilateral Renal Disease.—According to Goldstein, a bilateral surgical renal disease is a frequent occurrence. Three hundred and eight of 7,500 urologic patients studied (16.3 per cent) had bilateral renal disease. One hundred and eighty-three of these patients were less than 40 years of age; therefore the importance of early recognition and early correction. Eighty-three were operated on. Some of them were operated two, three and as many as ten times. Both kidneys were operated on in 28 cases. Nephrectomies, nephrotomies, pyelolithotomies, renal suspensions and in several cases prostatectomies were performed on these patients to relieve them of their condition. Eleven patients were in extreme condition and died before any operation was performed. Only 4 patients died after their operation. The remaining 79 patients operated on lived from one to twenty-one years. Both conservative and radical surgery may be necessary.

Ten per cent and sometimes less of renal reserve seems to be sufficient to permit a patient to tolerate a renal operation. Operations should be done in stages in bilateral renal disease.

Diethylstilbestrol for Endometriosis.—Karnaky treated 37 women with endometriosis, 3 of them with endometriosis of the incision, 4 in the posterior fornix, 3 with pelvic endometriosis diagnosed by biopsy or laparotomy, and 27 diagnosed by detailed histories and thorough physical examination, by oral administration of uncoated tablets of diethylstilbestrol. The initial dosage was 0.5 mg. every night for three nights, and every fourth night the dosage was increased 1.0 mg., until 5.0 mg. was being taken. Five milligrams was given every night until the patient began to spot or bleed, and then 10 mg. was given every fifteen minutes until bleeding stopped. The nightly dose of 10 mg. was continued until the patient again spotted or bled and was then increased to 15 mg. and the next time to 20 mg. The purpose was to keep the patient amenorrheic. Diethylstilbestrol dosage had to be increased about every two or six weeks because after a patient has been taking a certain dose over a period of time she will begin to bleed again. By the increase in the dosage the patient is again made amenorrheic. A pelvic examination was made every seven to ten days in order to determine when the bound down endometrial masses and pelvic organs had become freely movable and to keep the patient under constant observation during the administration of these large doses of diethylstilbestrol. If the pelvic organs had become freely movable, the treatment was gradually discontinued. It usually requires three to six months for the desired results. Pentobarbital sodium rectal suppositories were used to control nausea at the beginning of the treatment. Endometriosis is not stimulated to grow by large continuous doses of diethylstilbestrol, but small doses of the drug may stimulate it. Endometrial implants of the incision and in the posterior cul-de-sac which were blue and which bled before diethylstilbestrol was given have not returned to the blue color nor have they bled after diethylstilbestrol had been discontinued for six, eight to twelve months. Five patients became pregnant after diethylstilbestrol was discontinued. This preliminary report suggests that diethylstilbestrol is no panacea for the treatment of endometriosis but might become a valuable adjunct in the treatment.

Vasospasm Following Acute Arterial and Venous Occlusions.—Laufman and his associates say that their interest in the problem of vasospasm following vascular occlusions arose while studying the response of mesenteric vessels to intestinal strangulations. They were impressed by the importance of residual vasospasm in the involved vasculature following release of the strangulations at operation. Such vasospasm apparently had a decisive influence on the recoverability of strangulated bowel. The study also showed that regardless of whether the strangulations were primarily venous or arterial, vasodilating measures were of great value in resuscitation. In 40 animals the superior mesenteric vein was clamped with a rubber-tipped artery forceps from twenty minutes to two hours and twenty-nine minutes. The pattern of behavior of the smaller radicals following venous mainstem occlusion can be summarized as a moderate dilatation of the veins and marked spasm of the arteries. After release of the occlusion, the vein soon returns to its normal caliber, while the artery persists in a state of residual vasospasm for varying periods of time. Capillary behavior following venous occlusion generally is one of dilatation, but certain areas are in spasm at the same time. The same technic as was used in the case of the vein was used for occlusion of the superior mesenteric artery in 21 dogs. In arterial occlusion there is an arterial and a venous spasm. After release of arterial occlusions, reactive hyperemia occurs, but during this state the precapillary artery remains in spasm. "Sludge" formation (Kniseley) is seen in the smaller vessels during both arterial and venous occlusions. Minute thrombi form easily in the spastic vein during arterial occlusion and may propagate, thus accounting for segmental venous thrombosis in arterial occlusive disease. This observation makes it unnecessary to postulate the presence of periarterial inflammation as a venous irritant in the production of venous thrombosis.

Various Types of Sympathectomy and Vasopressor Responses in Hypertension.—Wilkins and his co-workers investigated the effects of the surgical removal of various portions of the sympathetic nervous system on the vasopressor responses of patients to standard stimuli. The subjects were mainly hypertensive patients, selected for surgical sympathectomy. They were studied before and again approximately two weeks after the operations. Certain patients were studied at longer intervals. Measurements were made with the patients lying quietly on the tilting ballistocardiograph. Sympathetic nervous stimuli were applied, including tilting into the upright position, production of reactive hyperemia in the limbs, the Valsalva experiment, the cold test and mental arithmetic. With the sudden stopping of a blood-pressure-lowering procedure the presence of vasoconstriction could be demonstrated by the appearance of a brief hypertensive overshoot. The authors stress that overshoots of arterial pressure appearing quickly after the cessation of blood-pressure-lowering procedures furnish a means of grading the amount of sympathetic nervous vasopressor reactivity of human subjects. The grade of vasopressor reactivity of a subject is markedly decreased or abolished after extensive bilateral sympathectomy. It is less affected by less extensive sympathetic denervations. The grade of vasopressor reactivity is not necessarily related to the resting level of arterial pressure of a subject. The abolition of overshoots of arterial pressure in hypertensive patients appears highly desirable.

Intra-Arterial Transfusion.—Under a pressure greater than that of the mean arterial blood pressure an infusion will enter the arterial system. The increased pressure and flow will be conducted throughout the entire system, as far proximally as the aortic valves. There will be an immediate increase in arterial pressure and volume. Under the conditions of shock, in which there is lowered blood pressure, decreased blood volume and reduced tissue perfusion, an intra-arterial infusion will act to restore to normal levels all three deficiencies. The authors describe a method for the rapid administration of blood intra-arterially with experimental observations and report of its clinical application in 12 patients. Their results substantiated the premise on which earlier investigators worked; that is, an immediate and sustained response is effected, with rapid rise in blood pressure and restoration of blood volume. Administration of blood by this method is indicated primarily in the treatment of shock resulting from a rapid decrease in blood volume and which fails to respond adequately to conventional therapy. Other measures to combat shock or hemorrhage, such as the administration of stimulants, oxygen, intravenous infusion and transfusion, can be used simultaneously. Intra-arterial transfusion involves the sacrifice of an artery and is a procedure which should be reserved for extreme emergencies after conventional methods of therapy have failed. Active bleeding from a wound, peptic ulcer or traumatized organ is not in itself a contraindication for intra-arterial transfusion, provided there is a possibility of control of the hemorrhage.

Tuberculous Pericarditis. A. A. F. Peel.—p. 195.

Left Bundle Branch Block.—Rasmussen and Moe say that in the course of previous investigations relating to the electrocardiogram in hypertension and in aortic incompetence they reached the conclusion that the left bundle branch block cardiogram might be caused by gross enlargement of the left ventricle apart from any local lesion of the bundle branch. In the present investigation they have sought to test this hypothesis further by an analysis of the clinical, radiologic and necropsy findings in a series of 100 cases presenting permanent left bundle branch block in the cardiogram. It was found that diseases affecting the left ventricle, such as hypertension and aortic valvular disease, predominated in this material, occurring in 72 per cent of cases, and that a considerable degree of left ventricular enlargement occurred with about the same frequency. In 14 cases there were reasons for presuming the existence of local damage to the left branch of the bundle, of which the most important cause was probably cardiac infarction involving the ventricular septum. Investigation suggests that the left bundle branch block electrocardiogram is due to enlargement of the left heart five times as often as to a local lesion of the left branch of the bundle. The authors believe that the left ventricular hypertrophy curve and the left bundle branch block curve represent different degrees of retarded conduction to the left side of the heart and that, therefore, no sharp distinction between them is necessary. Both imply, in most but not in all cases, a considerable degree of left ventricular enlargement, and both are found in association with diseases that affect the left side of the heart.

Right Precordial Lead.—According to Vesell and Shorr recent studies in clinical electrocardiography have indicated the desirability of taking multiple precordial leads as a general routine practice. They review data on the right precordial lead CF_1 and describe the characteristics of this lead in 265 patients without heart disease. They review variations of the T wave, in particular, in CF_1 in relation to changes in position of the patient, electrical axis of QRS, presence of a prominent Q wave in lead 3 and in left ventricular strain. In 2 patients, CF_1 was taken before and after the occurrence of a posterior myocardial infarction and revealed the development of characteristic changes. These characteristic changes in CF_1 were found in each one of 35 cases of recent myocardial infarction of the posterior wall. The authors discuss the diagnostic value of lead CF_1 in infarction of the posterior wall and direct attention to the usefulness of this lead in (1) locating the side of bundle branch block, with CF_4 or CF_5: (2) evaluation of left ventricular enlargement, particularly from displacement by the diaphragm; (3) possibly of right ventricular enlargement, and (4) in posterior wall infarction. It has also been used for better recording of auricular activity and as an aid in the diagnosis of tricuspid insufficiency.

Conservative Treatment of Placenta Previa.—Mills points out that it has long been taught that expectant treatment of *placenta previa can never be countenanced.* This principle was based on the supposition that a patient with a placenta previa would frequently bleed to death in the absence of intervention. Evidence is accumulating to suggest that more tragedies are produced by overtreatment than by neglect. After reviewing the recent literature on the conservative treatment of placenta previa, the author presents observations on 100 cases of placenta previa treated largely along conservative lines; there were no maternal deaths, and the fetal and neonatal loss was 16.5 per cent, which compares favorably with other recently reported figures. The majority of fetal deaths would appear to have been avoidable. The number of cases of placenta previa in which it is possible to adopt conservative measures depends on the stage of pregnancy at which the patient is sent to hospital. If this is done after the first hemorrhage, and there has been no previous intervention, Macafee's experience shows that deferring of active treatment may be practicable in over 50 per cent of cases; but if, as is shown in this series, there has already been procrastination or examination before admission, then this number may be reduced to about 25 per cent. In conservative treatment the mother must either be confined to hospital or lead a restricted existence at home for a number of weeks, and she may sometimes be required to suffer further hemorrhage; on the other hand, there is little increased danger to life, and there is a slightly lower chance of the need for delivery by cesarean section. If cesarean section should eventually become necessary there is a much greater probability of a live baby. The advantages to the fetus of conservative delay greatly outweigh the risks, since maturity is the prime requisite for fetal survival. However, any serious hemorrhage may suddenly produce fetal asphyxia, and consequently delay of even a few hours is unjustifiable when the fetus has reached a satisfactory stage of development. Since conservative treatment has been adopted reports show for the first time a fetal and neonatal loss below 30 per cent. There is opportunity for the reduction of fetal mortality in placenta previa to about 10 per cent while the maternal mortality remains at its present minimal figure.

Calciferol in Latent Tetany.—O'Donovan calls attention to some pitfalls in the diagnosis of latent tetany. The 34 patients studied by him were adults and adolescents, almost all of whom had latent tetany. This seems important, since most previous reports dealt with children who had acute or transient tetany. Hypocalcemia served as an index in latent tetany. It was found that the well known tests are unreliable. The tourniquet test was negative in result in 34 per cent of 89 observations on 32 patients, and Chvostek's sign was negative in 73 per cent of observations. A new test combining the tourniquet test and hyperventilation is described. It is used when the results of the tourniquet test are negative, and is more reliable than either of the two procedures used separately. Of 58 observations on 32 patients 95 per cent were positive. Two other patients whose tourniquet test was negative in result were physically unable to hyperventilate. Calciferol has an inhibitory effect on the signs of latent tetany which is independent of the increase in serum calcium. In 22 of 27 observations on patients who had received a total of more than 500,000 units the signs of latent tetany were abolished, although the serum calcium was still less than 9 mg. per hundred cubic centimeters. Thus it seems that calciferol inhibits latent tetany in two ways, by raising the serum calcium and by some other effect. The doses required to inhibit the signs of latent tetany in the average case of hypoparathyroidism on ordinary diet is between 50,000 and 150,000 units daily. The dose necessary to keep the serum calcium within normal limits may be considerably larger. It seems more reasonable to base the therapeutic dosage on a biologic test than on a chemical estimation. The higher dosage necessary to keep the serum calcium around 10 mg. per hundred cubic centimeters not only may be unnecessary but may have a deleterious effect. It seems well established that the toxic manifestations of vitamin D are not necessarily accompanied by hypercalcemia. The patients considered here, whose dosage and treatment were based on the signs of latent tetany, have so far shown no ill effect of low blood calcium such as lens opacities. It is difficult to explain the inhibitory action of calciferol on latent tetany that is not due to increased serum calcium. A relative increase in ionized calcium is at least a theoretical possibility.

Diabetes Insipidus After Head Injury.—Porter and Miller say that of all persons with nonfatal closed head injuries admitted to the Military Hospital for Head Injuries, Oxford, during the years 1940 to 1945, who numbered about 5,000, 13 suffered from diabetes insipidus. In addition to these 13 patients, the records of 5 others treated elsewhere are reviewed. In 15 of the 18 cases in which the site of injury could be determined, it was frontal or occipital. The symptoms were usually first noticed during the second or third week after injury. All patients treated responded to pituitrin. Spontaneous recovery took place in the majority, in 11 within nine months. Associated injury to the olfactory nerves and optic chiasm is common; other hypothalamic syndromes are rare. The mechanism of the injury is discussed, and it is suggested that a traction lesion of the pituitary stalk would best explain most cases.

Epileptic Response to Peripheral Injury.—Parsons-Smith says that a study of the literature reveals that in certain cases of reflex epilepsy there is an association between the epileptic response and peripheral injury. The author presents a man, aged 41, who in 1940 had had an attack of "spinal meningitis," from which he had recovered without sequelae and after which he had remained well for seven years. In January 1947 the man accidentally crushed his left hand beneath a 200 pound (90.7 Kg.) cable drum. This produced a cut on the dorsum of the left hand and was deep enough for him to be able to see his tendons. He noticed shortly afterwards that the whole of the thumb, the dorsum of the index finger and outer half of the middle finger seemed numb; this numbness was due to local damage to the terminal cutaneous branch of the radial nerve. It was about twenty-four hours later that, while sorting some papers, he noticed that these seemed to tickle his left thumb and index finger in a curious way. This was followed suddenly by stiffening of the thumb and first two fingers. The thumb was adducted into the palm, then the fingers flexed at the metacarpophalangeal joints. Within a second or two the arm began a series of jerking movements, the elbow became flexed and the arm rose to a position of abduction at the shoulder. The fit lasted for about half a minute, but recurred two or three times a day for the next week. Owing to the position of abduction which the arm assumed, he became self conscious, and tried by gripping his knee with his hand to restrain the limb. When he did this, the embarrassing abduction could be avoided. About ten days after the injury he was sorting some requisition slips when he suddenly appreciated that the curious tickling sensation produced by the papers on his left hand was spreading up his left arm. He gripped his knee tightly, but the feeling continued to spread, his jaw became clenched and he felt that his face was twisted. This was followed by a steam-engine-like noise in his head and he lost consciousness. He recovered in about twenty minutes, felt confused, and found that he had bitten his tongue. Medication with phenobarbital suppressed further attacks, but about eleven months after the accident when he was screwing up some newspaper with which to light a fire, he produced the aura in the left thumb and first finger. He swore loudly, gripped the fender as hard as he could, and thus aborted the attack. He had another minor focal seizure that afternoon. That night he played cards with friends. He was dealing the cards with his right hand and at the same time was pushing the cards forward from the pack, which he held in his left hand, on to the lateral side of his index finger. This produced the usual aura which on this occasion proceeded to a major fit. Since then the dosage of phenobarbital has been increased to 1 grain (60 mg.) three times a day and there has been no recurrence of fits.

Responsibilities During Anesthesia. E. V. Slaughter.—p. 470.
*Pain in Left Chest: Some Considerations in General Practice. A. Schott.—p. 474.
After-Treatment of Peptic Ulcer. G. D. Laing.—p. 479.

Pain in the Left Side of the Chest.—Schott points out that in many cases of pain in the left chest, the first point to decide is whether or not the symptom is of cardiac origin and, in particular, if it is anginal in nature. The symptom of angina is not necessarily indicative of structural disease of the coronary arteries. It is true that the great majority of such patients have some form of structural coronary disease—i.e., coronary sclerosis or syphilitic narrowing of the coronary orifices—but it should be borne in mind that angina may be produced by myocardial ischemia without structural coronary disease. Thus it may occur during attacks of paroxysmal tachycardia, owing to the altered mechanism of blood flow through the coronary bed, in advanced anemia or severe blood loss, and in certain extracardiac diseases. The author suggests that the simulation of coronary thrombosis by pulmonary embolism is probably due to a pulmonary reflex, resulting in coronary vasoconstriction via the vagus, superimposed on sudden strain of the right ventricle. In chronic disease of the gallbladder not only is the chest pain of the same character and distribution as the anginal pain due to structural coronary disease, but there is also evidence that the heart action is affected by the diseased gallbldader by way of reflex. Another abdominal condition which may give rise to anginal pain most probably by way of reflex is diaphragmatic hernia. Among the extracardiac conditions giving rise to pain the left side of the chest, those arising from the spine form an important group. Osteoarthritis of the cervical portion of the spine may closely simulate pain of cardiac origin. Occasionally lateral protrusion of the ruptured intervertebral disk between the sixth and seventh cervical vertebrae, with compression of the nerve roots, may produce pain in the chest which, if the lesion is left sided, may be mistaken for anginal pain, and if it occurs suddenly and is severe, for coronary thrombosis. Pain referred from the upper dorsal vertebrae as the result of impairment of alinement in a costovertebral joint may also simulate anginal pain. Several case histories are presented to illustrate the simulation of anginal pains by the aforementioned conditions. The author says that this is only a small selection of the great variety of conditions which may be mistaken for angina pectoris even by experienced physicians.

Congenital Varices of Esophagus. S. Jorup.—p. 247.

Congenital Malformations After Exposure to Measles in Early Pregnancy.—Hagströmer presents the histories of 2 infants with congenital malformation. One had a hare lip and partial cleft palate and the other had cleavage of the back palate, a rudimentary right ear placed a good distance forward on the cheek and a notably small chin. Both families had been free from such defects, but a brother of the first infant had had measles during the second month of the mother's pregnancy that resulted in the birth of the defective child. In the case of the second infant, 2 cases of measles had occurred in the family while the mother was in the second month of pregnancy. In both cases the pregnant women had remained free from measles, having had attacks during their childhood. Whether or not a causal relationship existed between the siblings' measles and the malformations described cannot be definitely decided.

Respiratory Disturbances in Poliomyelitis.—Aschenbrenner and Dönhardt report 228 patients with poliomyelitis; of these, 31 with severe respiratory disturbances were admitted to the Altona Hospital during the poliomyelitis epidemic in Hamburg in 1947. Only 6 of the 31 patients were less than 15 years of age, while 25 were between the ages of 16 and 42. The mortality rate of the entire group of 228 patients was 11.8 per cent. Nineteen of the 31 patients died before the initiation of the treatment in the iron lung. All of them presented the spinal type with mechanically conditioned hypoventilation. The remaining 12 patients were placed in the iron lung; 7 of them died during the first week. Treatment in the iron lung came too late for 3 of these patients who had already been moribund, while the other 4 had severe combined bulbospinal respiratory disturbances with pneumonia. Four patients recovered and could be discharged from the hospital with fairly adequate respiration. One of the fatal cases was that of a girl, aged 15; death from acute heart failure occurred suddenly on the sixty-sixth day of the disease after three bouts of pneumonia had been controlled with penicillin. Careful control of the heart and early treatment with strophanthin may be of decisive importance. Temporary, reversible paralysis of respiratory muscles is the chief indication for treatment in the iron lung.

Endocarditis Lenta.—Walter and his co-workers report 50 patients, 33 men and 17 women, with sepsis lenta, 48 of whom had endocarditis lenta and 2 cholangitis lenta. The majority of the patients were between the ages of 20 and 30. The clinical diagnosis was established bacteriologically in 26. History revealed that years ago 26 had attacks of articular rheumatism, with involvement of cardiac valves in 20. Thirty-four died, 10 recovered and 6 are still under treatment. Of 16 patients with symptomatic treatment 15 died, while 3 of 12 patients recovered who were given combined treatment with penicillin and supronal,® a new proprietary sulfonamide preparation consisting of a mixture of methylsulfapyrimidine and 4-aminomethylbenzenesulfonamide salt of sulfathiourea, known as dema.® The total dose of penicillin in these 3 cases was 1,000,000 to 5,000,000 units and that of supronal® was up to 300 Gm. These doses are considered small. Six of 18 patients recovered who were given combined treatment with adequate doses. Prolonged continuous treatment for three to four weeks is recommended. A standard scheme cannot be given. Not only the blood level but the tissue level of the drugs is important. The initial dose of supronal® was 4 Gm., with 10 to 12 Gm. per day and later with 8 Gm. per day in order to maintain the desired blood level. Sodium bicarbonate should be administered simultaneously, and that applies also to the rectal administration, which should be practiced if the drug is not tolerated by mouth. Repeated determination of the resistance of the causative agents to penicillin and supronal® is required, since too low a dosage may be responsible for a considerably increased resistance to the drugs. The combined treatment causes shifting of the alternate play between virulence and resistance to the disadvantage of the virulence. Temperature, blood sedimentation rate, enlargement of the spleen, bacteriemia, microhematuria and blood picture were restored to normal in 10 patients, 3 of whom were followed up for more than one year, 4 more than six months and 3 for less than six months. A recurrence cannot be excluded definitely, but prognosis may be considered favorable in the absence of any clinical manifestation for more than one month after discontinuation of the treatment.

*Quantitative Determination of Hypophysial Gonadotropin in Urine. Use in Diagnosis of Amenorrhea. F. A. de la Balze and J. Argonz. —p. 303.
*Chronic Cor Pulmonale With and Without Cardiac Insufficiency: Respiratory and Circulatory Function. A. C. Taquini and B. B. Lozada. —p. 325.

Gonadotropin in Urine.—De la Balze and Argonz performed quantitative determinations of gonadotropic hormone in the urine in 83 nonselected patients with amenorrhea. The Zondeck method, as modified by Heller and Heller, was used. Increased elimination of the hormone in the urine suggests amenorrhea due to ovarian estrogenic dysfunction or to greatly diminished ovarian estrogenic function, whereas diminished elimination suggests amenorrhea from gonadotropic hypophysial dysfunction or from greatly diminished hypophysial function. Amenorrhea in the presence of a normal urinary elimination of the gonadotropic hormone may be due to: (1) lack of response of the endometrium to normal gonadotropic hypophysial and estrogenic ovarian stimulation, (2) a moderate degree of either hypophysial or ovarian dysfunction and (3) either psychogenic or organic hypothalamic involvement. Amenorrhea of predominantly estrogenic ovarian origin is the most frequent. It includes cases of physiologic, early spontaneous and artificial menopause and those of patients with rudimentary ovaries. That of predominantly gonadotropic hypophysial origin includes cases of hypophysial myxedema, nonacromegalic tumors with destruction of the hypophysis, nervous anorexia with poor nutrition, acromegaly and primary thyroid myxedema. Amenorrhea of neither a predominantly ovarian nor a hypophysial origin includes cases of uterine, psychogenic hypothalamic and acromegalic origin, as well as those of patients with vaginal agenesis or with certain forms of neurosis, hyperthyroidism and hypertension with symptoms simulating menopause. The aforementioned method is of use for the diagnosis of different types of gonadal insufficiency, the state of the gonadotropic pituitary function and the physiopathologic diagnosis of amenorrhea.

Chronic Cor Pulmonale.—Taquini and Lozada determined the respiratory and circulatory functions in 54 patients with clinical symptoms of cor pulmonale with or without cardiac insufficiency. For comparison observations were also made on two control groups of 7 patients with asthma without cardiac or pulmonary disease and in 40 patients with heart disease and with normal lungs. The authors found that in patients with chronic cor pulmonale without bronchial spasm the pulmonary ventilation is normal in presence of cardiac sufficiency and increased in presence of cardiac insufficiency. In presence of chronic cor pulmonale with bronchial spasm there are dyspnea and hyperventilation of pulmonary origin, which prevents differentiation of cardiac sufficiency. However, in these cases, cardiac sufficiency can be determined after administration of bronchodilating drugs. The vital capacity was found to be reduced in all the cases. This reduction was accentuated by cardiac failure. The ratio of vital capacity to total capacity, reduced by the pulmonary disease, showed no significant difference when it was studied in cor pulmonale with cardiac failure. The venous pressure was normal in most of the cases of purely respiratory disease. In some cases it was increased, reaching 210 mm. in 1 case. In patients with cardiac failure, the venous pressure was always high. As a rule, figures higher than 200 mm. are only found in patients with cardiac failure. The arm to tongue circulation time was a less valuable aid, since frequently it was found increased in the absence of cardiac failure.

*Results of Vitamin D_2 Treatment in 111 Patients with Noncavernous, Open Pulmonary Tuberculosis. C. Dijkstra.—p. 3385.
Spontaneous Hemopneumothorax. A. S. Groen and E. G. Godfried. —p. 3393.
Retrobulbar Neuritis in Focal Infections. J. A. G. ten Berg.—p. 3398.

Vitamin D_2 in Pulmonary Tuberculosis.—In view of the fact that vitamin D_2 produced favorable effects in patients with tuberculosis of the skin and mucous membranes, Dijkstra tried this medication in noncavernous open pulmonary tuberculosis. The patients were given one tablet containing 30,000 units three times daily for eight to ten months. In some of these patients bronchoscopy disclosed mucosal changes in the form of ulcerations, granulations, caseation and tubercles, while in others the mucosa was merely red and swollen. In many of the patients the sputum had been positive for nearly two years; in others, for a shorter period. Many of the patients had been treated unsuccessfully for more than a year by other methods. In 111 of the patients the sputum became negative in three to six months after the start of the D_2 medication and the mucosal changes in the bronchi disappeared. An average of seven and one-half months have elapsed since the sputum became negative.

Dementia Paralytica: After-Examination.—In 82 of the 110 cases of dementia paralytica treated in Lier Hospital from 1926 to 1947, in 85 men and 25 women, aged from 14 to 69, malaria treatment was used, with 2 deaths following the treatment. The malaria treatment was followed by antisyphilitic treatment. Penicillin was not used. Fifty patients were discharged. Of these 15 are dead, the fate of 3 is unknown, 7, though not self supporting, have some work capacity, in 13 the progression of the disease has apparently been halted but there is a stationary psychosis, and 12, treated within three months of the onset of the disease, are psychically normal and have resumed their former occupations. Knudsen says that the results of the treatment depend primarily on early diagnosis and stresses that early diagnosis can be made only by examination of the spinal fluid. The defects present at the start of the treatment can hardly be repaired to any noteworthy degree, although they may be somewhat ameliorated. It may be difficult to determine the extent of the process. Some years after the terminated antisyphilitic treatment examination of the spinal fluid is advised for all syphilitic persons, and on the slightest sign of pathologically changed spinal fluid treatment should be begun at once, as if paralysis were present.

Results of Prefrontal Leukotomy.—Knudsen says that to date 87 prefrontal leukotomies have been performed in Norway, in patients aged from 23 to 69. The indications were psychoses with unfavorable prognosis and, as a rule, of long duration, in which spontaneous remissions could not be expected and which were resistant to other treatment. The duration of the disease was from one to thirty-seven years. There were 15 postoperative deaths. Cerebral hemorrhage during the first weeks after operation, the most frequent complication, caused death in 9 cases; in 2 cases death was due to meningoencephalitis; in 3, to bronchopneumonia, and in 1, to miliary spread of pulmonary tuberculosis. Postoperative complications were epileptic seizures, in 7 cases, and impaired sphincter control with urinary and fecal incontinence, in some instances lasting for months. A by-effect observed in a number of cases but not mentioned in literature was decided tenderness of the skin of the face of unknown cause. The final result of the operation is not evident before two years and depends not only on the operation but on active and suitable after-treatment. Thirty-five patients (10 hebephrenic and catatonic schizophrenics, 11 paranoid patients, 10 patients with depressive conditions and 4 with constitutional psychopathic inferiority) were discharged as more or less able to work without needing public care, 22 patients were considerably improved though still hospitalized, 13 were more easily cared for, and 2, unchanged. In addition to the high mortality risk the change in the patient—greater indolence, reduced productivity, narrowed interests—must be considered. Still prefrontal leukotomy offers many advantages so that until improved and less hazardous methods are developed the procedure will be justified in carefully selected cases.

Neurovegetative Disturbances in Parkinson's Disease.—According to Frommel, patients with Parkinson's disease present basal lesions, and their disturbances of salivation, of muscular rigidity and of mimics are related to the diencephalon. All symptoms of the patients whose diencephalic relays are directly or indirectly affected, are the result of disturbances of the cholinergic and the adrenergic regulation. The symptoms of Parkinson's disease are externalized by a vagotonic prevalence. This parasympathicotonia may be favorably influenced by belladonna, the point of attack of which is more peripheral than central. Parkinson's disease, however, reacts better and more rapidly to two new drugs, parpanit® (diethylaminoethyl-1-phenylcyclopentane-1-carboxylate hydrochloride) and the R. P. 2987 (diethylaminoethyl-N-thiodiphenylamine), which are anticholinergic, antiadrenergic and antihistaminic. They act on the mediators of the neurovegetative stimulation. Everything suggests that their effect is a central one on the relays themselves of the cholinergy. Parkinson's disease therefore may be considered as a disorder due to lesions of the mediators of the stimulation of the autonomous nervous system and of the reactions of their respective enzymes.

Roentgen Therapy in Treatment of Asthma (Results on 800 Cases Followed Up). P. Vallery-Radot and P. Blamoutier.—p. 813.
Recent British Inquiry on Pneumoconiosis Caused by Coal Dust. A. Policard.—p. 814.
*Extradural Cyst Following Tearing of Root of Brachial Plexus. C. Gros and R. Cazaban.—p. 815.

Extradural Cyst Following Tearing of Root of Brachial Plexus.—Gros and Cazaban report the case of a man, aged 42, who was sent to their service on account of flaccid paralysis of the right arm. About a month before, he had had an automobile accident. The paralysis of the right arm had been evident immediately after the accident. Now he complained of severe pain of the causalgic type. Examination revealed trophic disturbances, flaccid paralysis and anesthesia of the right arm. A stellectomy was done on the right side, but the pains recurred although they were now less frequent. Later the patient was subjected to a right-sided hemilaminectomy on the seventh, sixth, fifth and fourth cervical vertebrae. An extradural cyst was discovered which reached from the first dorsal to the third cervical. Since this operation did not relieve the pain, the patient demanded amputation of his arm. The author believes that tearing of the brachial plexus may produce an arachnoidal breach, which is followed by an extradural collection of cerebrospinal fluid. This collection sometimes results in an isolated cyst of the subarachnoid space. This is comparable to complications that may follow an intradural surgical approach either on the medulla or its roots, several examples of which have recently been reported in the American literature. A knowledge of these post-traumatic cysts may elucidate the pathogenesis of certain remote sequels of surgical operations on the medulla or its roots.

*Neurobartonellosis: Case. P. S. Peralta.—p. 641.

Neurobartonellosis.—The subject of this report is a girl 15 years of age with the gravest type of neurobartonellosis. The disease began with fever and an eruption. Fever was followed by rapidly progressive anemia, fronto-occipital headache, general muscular pain, pain in the bones, unilateral disesthesia, tremor of lips, blurring of vision, dizziness, increased tendon reflexes, acute epigastric pain, nausea, vomiting and dyspnea. The blood contained 60 per cent of parasitic cells. Treatment consisted of intramuscular injections of penicillin in daily doses varying between 200,000 and 600,000 Oxford units, up to a total dose of 5,000,000 units in twenty-two days. Penicillin caused disappearance of Bartonella organisms from the blood, controlled anemia, favorably changed the course, duration and acuteness of the disease and controlled all of the clinical and nervous symptoms of the disease.

*Choline in Treatment of Toxicosis in Infants. A. Gentili and W. Tangheroni.—p. 487.
*Local Streptomycin Therapy in Tuberculous Pleurisy. L. Nassi.—p. 509.
New Diagnostic Test (Index of Diffusion) in Local Streptomycin Therapy in Tuberculous Meningitis. A. M. Comparetti, G. Pasquinucci and Annalena Zoli.—p. 539.

Choline in Toxicosis of Infants.—Gentili and Tangheroni believe that toxicosis from functional insufficiency of liver is the most important factor in gastroenteritis of infants. They report favorable results from administration of choline hydrochloride in 25 cases. The drug was given twice daily by intramuscular injection. A 2 per cent choline hydrochloride solution was used in fractional doses of 2 cc., up to a daily dose of 4 cc. for four, six or ten consecutive days. The drug was well tolerated. Recovery was obtained in 20 patients. The drug acted by improving the antitoxic function of the liver, by controlling vomiting and dehydration and by causing prompt regression of all clinical symptoms. The 5 patients who received no benefit from the treatment were seen late in the course of the disease.

Local Streptomycin Therapy in Tuberculous Pleurisy.—Nassi reports good results in 24 children with clinical diagnosis of the disease which was confirmed by the Mantoux test, positive cultures and biologic tests of the pleural liquid for tubercle bacilli. The treatment consisted of thoracocentesis and injection of the drug. Thoracocentesis should be liberal and in some cases repeated. The dose of streptomycin injected locally varied between 200 and 300 mg. Insufflation of air into the pleural cavity is advisable for prevention of adhesions. Calcium and vitamins A and D_2 in large doses should be given in the course of streptomycin therapy.

*Histoplasmosis. Contribution to Etiologic Differentiation of Pulmonary Calcifications. F. Koller and H. Kuhn.—p. 1077.
Surgical Aspects of Bang's Disease. W. Birrer.—p. 1080.
Contribution to Treatment of Ulcer of Stomach and of Duodenum in Early and Late Cases. Second Report. H. Neumann.—p. 1085.
Is There Any Familial Disposition to Poliomyelitis? H. Czickely.—p. 1092.

Histoplasmosis.—Koller and Kuhn performed cutaneous tests of sensitivity to histoplasmin at the Medical University Clinic in Zurich on 180 adult patients whose chest roentgenograms showed calcifications of the lungs or of the hili. Only 2 of the 180 patients reacted to the intracutaneous injection of 0.1 cc. of a freshly prepared 1 : 100 dilution of the culture filtrate of the mycelium form of Histoplasma capsulatum. One of the patients with a positive reaction, a man aged 68, had lived in the Middle West of the United States for seven years; the other, a man aged 28, was born in Java and had lived there for twenty-five years. The same cutaneous tests were performed in a series of 555 Swiss army recruits. None of the recruits reacted to histoplasmin. These results did not provide any proof of the occurrence of histoplasmosis in Switzerland. It is likely that the 2 clinical patients with pulmonary calcifications and with positive reactions to histoplasmin had become infected outside of Europe.

*Morgagni's Syndrome. Effects of Irradiation Treatment of Pituitary Gland. J. Warter, A. Fitzenkam and J. M. Rouillard.—p. 299.
Hereditary Thrombopathies. S. Wiener.—p. 302.

Morgagni's Syndrome.—Warter and his associates report 1 case of Morgagni's syndrome in a woman aged 56. The patient presented a moderate obesity of the abdominal wall, but no signs of virilism. There was a pronounced asthenia, anorexia, severe attacks of vertigo, daily headache and insomnia. Her short moments of sleep were disturbed by nightmares. Vestibular hypoexcitability was demonstrated on Bárány's test. Definite frontal hyperostosis was revealed on roentgenologic examination; there was calcification of the dural fold separating the cerebral hemispheres, and considerable thickening of the cranial wall. There was definite retrostellate calcification with pronounced osteophytes. Treatment consisted of two series of irradiation of the pituitary region, with 2,000 r. The vertigo disappeared completely at rest. Headache was attenuated and did not occur daily. Asthenia was less profound and the patient was less depressed. Sleep remained light but was no longer disturbed by nightmares. Appetite was improved. The patient in general was benefited by the treatment.

*Behavior of PQ Time in Bundle Branch Block Curves. A. Moll.—p. 553.
*Relation Between Hemoglobin Content and High Altitude Tolerance. W. Blasius.—p. 581.
Clinical and Pathologic-Anatomic Observations in Absence of Left Coronary Artery. H. Reindell and H. Harnasch.—p. 595.

P-Q Time in Bundle Branch Block Curves.—In analyzing a considerable number of records made in the course of bundle branch block, Moll found that bundle branch block of the left side often concurs with prolonged P-Q time, whereas in bundle branch block on the right side this is almost never observed. This behavior of the P-Q time is of value in the differential diagnosis. It can probably be explained by the peculiar vascular supply of the stimulus conduction system. The right coronary artery supplies the left bundle branch as well as the auriculoventricular system, and, if this artery is diseased, the electrocardiogram will reveal bundle branch block as well as prolongation of P-Q time. Deviations from this behavior are discussed.

Hemoglobin Content and High Altitude Tolerance.—Blasius investigated whether a direct relationship exists between increase in hemoglobin content and improvement in tolerance for high altitude. His experiments were made on men not accustomed to high altitude and on aviators who had had high altitude training. He detected a definite relationship between hemoglobin content and tolerance for high altitude.

Book Notices

New and Nonofficial Remedies 1948 Containing Descriptions of the Articles Which Stand Accepted by the Council on Pharmacy and Chemistry of the American Medical Association on June 15, 1948. Issued Under the Direction and Supervision of the Council on Pharmacy and Chemistry of the American Medical Association. Cloth. Price, $3. Pp. 800 . J. B. Lippincott Co., Philadelphia 5, 1948.

In a recent discussion some pointed criticism was made concerning the title of this book. It was contended that by the time a therapeutic agent is included in the book it is not strictly "new"; that, with the increasing frequency of pharmacopeial revisions the agent, if it carries out its original promise, will soon become "official," and that the drugs included are not "remedies" in the sense that they will cure a disease or, in themselves, restore health.

Granting the cogency of these points, it may also be pointed out that over the years the title, "New and Nonofficial Remedies," has come to represent or connote to the physician, for whom it is primarily intended, a source of needed information, weighed and sifted by representative and competent authorities, concerning the most valuable or promising agents of his current armamentarium. In view of this and of the difficulty of replacing or modifying well known and accepted designations, it would appear that only officious pedantry would dictate a change in the title.

An entirely new feature of the present volume is the section on the relation of the Council on Pharmacy and Chemistry to other bodies concerned with drug products and advertising. These include: The Food and Drug Administration, The Federal Trade Commission, The United States Public Health Service, The United States Treasury Department, The Post Office Department, The United States Pharmacopoeial Convention and The American Pharmaceutical Association. A brief but informative and valuable discussion of each of these agencies is given.

Some thirty-two new monographs appear, representing agents that have been accepted by the Council since the 1947 edition of the book. One notes many additions to the list of new generic designations recognized by the Council for products which have been accepted as marketed under protected names; critical examination reveals the care with which the various chapters and subclassified sections have been revised. The chapters on local anti-infectives and systemic anti-infectives are noteworthy in this regard, apparently by reason of the acceptance of a number of new preparations in these categories. A section on surface anti-infectives is new. A section on protein and amino acid preparations has been added to the chapter on "Agents Used in Metabolic Disorders."

An up to date medical library would not be complete without a copy of this valuable compendium.

Chemistry in Nursing. By Raymond E. Neal, Associate Professor of Chemistry, Simmons College, Boston. Cloth. Price, $4. Pp. 564, with 27 illustrations. McGraw-Hill Book Co. Inc., 330 W. 42nd St., New York 18, 1948.

Seldom does one see a textbook in general chemistry as well written and as easy for the student and instructor to use as this one which aims to include "the inorganic and organic chemistry that the student nurse will need as a foundation for her further studies and professional practice." It avoids being "a bare outline of the essential facts" without giving more material than can be covered in sixteen weeks (thirty-two lectures and sets of lecture demonstrations and fifty-three laboratory experiments). "Teaching aids" include lecture outlines, directions for demonstrations, lists of materials required for the student experiments, directions for removing common stains and a comprehensive list of films (and their sources) that may be used in an elementary course. The reviewer objects to the fact that the laboratory experiments are not in a separate manual but are at the end of each unit on pages numbered consecutively with the text, so that when they are torn out to hand in to the instructor the book is mutilated. It should be emphasized that the author's experience seems to have been with students capable of college grade work: Although the text is easy to use, it requires serious, intelligent study.

Comment naissent les hommes: La reproduction, les âges de la vie. Par J. P. Bouckaert, professeur à l'Université de Louvain, Louvain. Paper. Pp. 305, with illustrations. Desclée de Brouwer & C^ie^, Quai au Bois 22, Bruges, Belgium, 1948.

This is an unusual and interesting account of the many phases of human reproduction, based on a series of lectures given at the University of Louvain. Bouckaert approaches the subject from a broad point of view, in which he tries to combine the data of physiology with the findings of social statisticians, to provide the basis for a biologically correct ethical approach to sexuality, marriage, control of conception, etc. The physiologic data are derived mostly from the literature on human beings, and supplemented with the more abundant material based on animal experimentation.

The first half of the book is concerned with the primary and secondary sex characters, sex determination, the sex instinct, rhythmicity and human sex behavior. Then follows a chapter on conception, the fetus, the physiology of pregnancy, of labor and of lactation. In chapter 4, called the "Aim of Reproduction," Bouckaert discusses the causes of fertility and sterility, conception control, birth rates, population statistics and the ethical implications of the subject. The final portion of the book considers some aspects of growth, adolescence, maturity and old age.

The book is well written and beautifully illustrated. The author gives evidence of a sound knowledge of the modern literature. However, his deductions in the field of ethics, especially the control of conception, are labored and open to wide disagreement. Biology is here made to fit and justify one particular system of ethics to the exclusion of other points of view.

The Rh Blood Groups and Their Clinical Effects. By P. L. Mollison, A. E. Mourant and R. R. Race. Medical Research Council Memorandum No. 19. Paper. Price, 1s.6d. Pp. 74, with 3 illustrations. His Majesty's Stationery Office, York House, Kingsway, London, W.C. 2, 1948.

The discovery of the Rh factor in 1940 by Landsteiner and Wiener was followed in rapid succession by its application to blood transfusions by Wiener and Peters (1940) and to fetal erythroblastosis (now called preferably hemolytic disease of the newborn) by Levine (1941) who had already described, in 1939, an atypical hemagglutinin which he attributed to transplacental immunization of the mother by fetal antigen. British contributions began to appear in 1943, and since then investigators in both countries have shared in the progress. The three co-authors have been the leaders in the field of Rh investigation in Great Britain. The monograph is divided in three parts. Race, who has added so much to the knowledge of genetics of the various Rh types, wrote the first chapter on classification. The lucid presentation of the British nomenclature of Fisher-Race will interest those who are trying to make up their minds about the respective merits of the two systems (the one mentioned here and Wiener's).

The second chapter, on clinical considerations, was written by Mollison. The obstetrician, the pediatrician and the clinical pathologist will be those mainly interested in discussions on such topics as interpretation of Rh antibodies in pregnancy, differential diagnosis of hemolytic disease of the fetus and newborn, premature termination of pregnancy, treatment, replacement transfusion, etc.

The final chapter on Rh testing, by Mourant, is of special interest to the clinical pathologist. All essential information on technic is given in a clear and concise manner.

The monograph is a fine example of good writing. It can be recommended as an excellent guide to all interested in the expanding field of Rh and its ramifications.

Ophthalmology in the War Years. Volume II (1944-June, 1946). Edited by Meyer Wiener, M.D., Professor of Clinical Ophthalmology, Washington University School of Medicine, St. Louis. Cloth. Price, $16. Pp. 977. Year Book Publishers, Inc., 304 S. Dearborn St., Chicago 4, 1948.

This volume contains a review of ophthalmic literature published during the war years 1944 to June 1946, and continues the project to review ophthalmic literature published during the war. Volume I covered the years 1939 through 1943. An attempt has been made to include everything of importance published during the war, including case reports of unusual interest. An editorial staff of thirty-seven specialists aided in the collecting and abstracting of all available articles and books pertinent to the field. A review of the literature is presented under thirty-seven subject headings beginning with anatomy and embryology and including chapters on fundamental and clinical subjects. Articles which are not discussed in the reviews are listed in the bibliographies, which are as complete as could be secured. The reader will find some articles which were published before 1944 but which were not available at the time the first volume came from the press. The book is of value not only to those who did not find the time to read all of the available literature during the war years but also to those who were unable to obtain it and to those who wish to delve quickly into the recent literature or who wish to have a resume of advances in all branches of ophthalmology during the period of the war.

Bacterial and Mycotic Infections of Man. Edited by René J. Dubos, Ph.D. [Aided by a grant from the National Foundation for Infantile Paralysis, Inc.] Cloth. Price, $5. Pp. 785, with 101 illustrations. J. B. Lippincott Co., 227-231 S. 6th St., Philadelphia 5, 1948.

This volume is a companion volume to "Viral and Rickettsial Infections of Man" edited by Dr. Rivers. Like the companion volume it has received generous financial support from the National Foundation for Infantile Paralysis, which makes possible its low selling price. Thirty-four authors have contributed the thirty-seven chapters in the book.

The facts and the problems concerning host-parasite relationship to infectious disease are stressed, even though in some instances the relationship is potential or remote. The arrangement of the order in which the various pathogenic agents are described does not follow an exact pattern because of the diversity of the infectious processes. For example, in the case of the diphtheria bacillus the concept of toxemia and of antitoxic immunity is stressed. The pneumococcus infections are chosen to emphasize the problems of antibacterial immunity, whereas the streptococci demonstrate multiple pathogenic potentialities. The book lacks continuity, which is inevitable with so many authors. Furthermore, some of the chapters reflect the research interests of the authors rather than a broad coverage of the subject.

The printing and illustrations are excellent and the book can be highly recommended to medical students, graduate students in bacteriology and physicians.

A Way to Natural Childbirth: A Manual for Physiotherapists and Parents-to-Be. By Helen Heardman. Cloth. Price, $2.50. Pp. 124, with 66 illustrations. Williams & Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

There has been an increasing awareness of the role of education in normal childbirth. Grantley Dick Read has influenced an increasing number of obstetricians to take an interest in the preparation of the patient for natural labor by special exercises, demonstrations and education. Mrs. Heardman, a trained physical therapist, instructs the women during their pregnancies in the art of relaxation, using a series of skilfully designed exercises. She explains away the fears of their forthcoming labors by familiarizing them with the various events that will take place.

This small manual describes and illustrates the various exercises. It concludes with some data concerning the decreased incidence of analgesia, operative delivery and complications in the group of women properly instructed in comparison with a normal control group. These tables and figures are not convincing. Letters from patients are equally unimpressive. Dr. F. J. Browne has written a short foreword to this volume. Although the book was written as a manual for physical therapists and parents to be, it can be read with profit by physicians.

The W. H. Ross Foundation (Scotland) for the Study of Prevention of Blindness. Paper. Price, 3s. Pp. 236. University of London Press, Ltd., Little Paul's House, Warwick Square, London, E.C. 4, 1948.

Mr. William Henry Ross of Davidson's Mains, Scotland, became totally blind at the age of 69. As a result of his personal tragedy, he became keenly interested in the study of the causes of blindness and its prevention. In 1935 he established the foundation bearing his name, but it was not until several years later, particularly during the war, that it began to function. The present report consists of a series of scientific papers, reprints of work published elsewhere by the authors, subsequent to 1935. It also includes an interesting history of the foundation and a summary of its valuable activities in the past thirteen years. It is good to have all of these contributions under one roof, so to speak.

Since Edinburgh is the center of a large coal mining area, and eye injuries are a common cause of blindness and loss of working time, it was natural that the early work of the members of the foundation should be concerned with the prevention of industrial accidents and the treatment of these injuries. Perhaps the most frequent injuries that are encountered are those of the cornea. Infection was prevalent and hypopyon ulcer was present in over half of the cases studied, 66.8 per cent in coal miners. Research work at Edinburgh University on behalf of the Ross Foundation, under the supervision of the late Professor A. J. Clark, showed that sodium sulfacetamide was efficacious in the treatment of these ulcers. With this investigation as a basis Robson, Scott and other workers experimentally and clinically studied the effects of this drug on various other types of corneal ulcers and showed beyond question that this substance is highly efficient. As a result of this work, the British armed forces, and later ours, became interested, and sodium sulfacetimide, under the name of albucid®, became widely used in the field. It is fitting, therefore, that seventeen of the twenty-one papers that are collected in the volume should deal with the bacteriology and the treatment of corneal ulcers. Among the others, there is a fine paper on the statistical analysis of the causes of blindness in Scotland by the foundation's director, R. M. Dickson, and a study of ocular siderosis by Loewenstein and Foster, reprinted from the *American Journal of Ophthalmology*. The report should appeal to those who are interested in industrial ophthalmology and ocular injuries.

Oral Vaccines and Immunization by Other Unusual Routes. By David Thomson, O.B.E., M.B., Ch.B., Director of the Pickett-Thomson Research Laboratory, London, and Robert Thomson, M.B., Ch.B., Pathologist, St. Paul's Hospital, London. Assisted by James Todd Morrison, M.D., D.P.H. Cloth. Price, $11. Pp. 329, with 5 illustrations. Published for the Pickett-Thomson Research Laboratory, Highwood Hill, London, N.W.7, by the Williams and Wilkins Co., Mount Royal and Guilford Aves., Baltimore 2, 1948.

This book reviews the literature regarding the experimental and clinical aspects of immunization by way of the mouth, rectum, respiratory tract, skin, vagina and other areas. As stated in the preface, the book was completed in 1936 but because of several misfortunes was not published. Although the literature for 1936 to 1947 was added by Mr. Morrison, it is not as thorough as previous to 1936. Of some thousand references, only 3 per cent are after 1936. Almost 100 pages are devoted to oral vaccination with BCG. The next in order of space allowed were typhoid and bacillary dysentery, vaccination against common colds (using the common organisms found in the nose and throat but not viruses). Of historical interest, oral vaccinations have been tried against smallpox, pneumonia, measles, septic wounds, hay fever, poison ivy, tetanus, snake venom, etc.

The sum of this review is that experimentally in animals and man there is probably no doubt that a certain amount of absorption of antigen does take place by way of the gastrointestinal tract, as well as the other avenues mentioned. But the regularity and degree of absorption and the state of the antigen after absorption are not consistent or reliable. For example, in BCG by mouth, such heroic doses as 200 mg. in children two months to fourteen years of age gave a positive tuberculin reaction after one year in 68.5 per cent of cases. This reactivity decreased progressively. In some 1417 newborn infants vaccinated with BCG by the multiple puncture, parenteral method, some 99.7 per cent reacted to tuberculin after four to five weeks, and 90 per cent remained positive after four to four and one half years. In children and young adults after use of this method, 90 per cent will have positive reactions to tuberculin in two weeks. The authors fail to mention this method and give too few results of other methods in comparing the values of the relative methods. From both the experimental and the clinical standpoint, BCG vaccination by the parenteral route is decidedly more effective in the rapidity of development and the degree and duration of immunity than the oral route. The efficiency of parenteral vaccination against typhoid, pneumonia, smallpox and dysentery is likewise much greater by the parenteral than by the oral route.

Although a certain degree of immunity can be achieved by oral route, the rapidity of the development of immunity and degree of immunity is decidedly in favor of the parenteral route. As to the ease of administration, ostensibly the oral route has an advantage but, since multiple doses are required for vaccination by the oral route and only single doses can be effective for parenteral vaccination, from a public health standpoint the parenteral route is the one of choice. The Pickett-Thomson Research Laboratory is a commercial biologic laboratory interested in oral vaccines.

Microbes Militant: A Challenge to Man: The Story of Modern Preventive Medicine and Control of Infectious Diseases. By Frederick Eberson, Ph.D., M.D., F.A.A.A.S., Assistant Chief, Laboratory Service, Veterans Administration Medical Teaching Group, Kennedy Hospital, Memphis, Tennessee. A Revision of "The Microbe's Challenge." Second edition. Cloth. Price, $4.50. Pp. 401, with illustrations. Ronald Press Co., 15 E. 26th St., New York 10, 1948.

An excellent job of orientation for the general public has been done in this volume, one of the Humanizing Science Series. The book, representing a revision of an earlier publication, "The Microbe's Challenge," tells the story of preventive medicine from its earliest days, when Koch, Pasteur, Lister and other pioneers fought what must have seemed at times a hopeless battle to break away from ignorant beliefs and superstitions, down to development of modern concepts and practices.

Difficult as it is to come to a full stop or make any final statements regarding preventive measures in the rapidly shifting battleground of medicine today, Eberson almost without exception has given an accurate report on advances by science. The possible future is portrayed conservatively but with full appreciation of the many difficulties still remaining. As he states in his conclusion, "And now we are again at the Gate of Resistance opened by Louis Pasteur when he started out on his first journey." The thought behind that statement is not one of futility, but rather that our battle with microbes is never ending.

The review is done in an easy, intimate style that makes its reading a pleasure. Unusual words are always defined graphically when first used, and an excellent glossary provides additional assistance along those lines.

Also adding greatly to value of the book for those who may be interested in historical aspects of medicine is a special index of authors and personages and an extensive compilation of volumes suggested for additional reading. Twenty-six illustrations, many of them of great historical interest, are contained in the book.

Thought-provoking aspects of modern medicine are highlighted in many of the thirteen chapters, among which may be mentioned the ones on "Virus Riddles," "Epidemics to Order" and the final chapter, "The Challenge."

Undoubtedly the volume will help greatly to promote better understanding by the public of what a difficult course physicians must follow in their never ending war with death's battalions. Physicians themselves will find it valuable in helping them to put into understandable language what they may be called on to discuss in appearances before lay audiences.

Vitaminas y Sangre. Por el Dr. Gustavo Pittaluga, Catedrático de la Facultad de medicina de la Universidad de Madrid. Biblioteca del médico práctico, Volumen XXV. Fabrikoid. Pp. 746. Cultural, S.A., Habana, Cuba, 1948.

This is an extensive review of the literature on the relation of vitamins to the physicochemical and morphologic composition of the blood in health and disease. A chapter is devoted to the methods of determining the amount and kind of vitamins in the blood and in the urine. Data are given on the effects of vitamins on nutrition, on the growth of the body and hemopoietic tissues, and the effects on disease and physiologic states. The literature is covered fairly well, and the author cites his own experimental observations. This is the most complete account of the subject available and the book is a valuable reference work for data on vitamins in general.

Fractures and Dislocations for Practitioners. By Edwin O. Geckeler, M.D. Fourth edition. Cloth. Price, $5. Pp. 371, with 344 illustrations. Williams & Wilkins Co., Mt. Royal & Guilford Aves., Baltimore 2, 1948.

In preparing this edition and bringing the book up to date new and approved methods have been added. Emphasis has been placed on fundamentals for the student, and only the most practical methods have been selected for guidance of the practitioner. The author continues to recommend one method which he considers the simplest and most reliable for the best functional result.

The purpose of this book is to condense the subject of fractures and dislocations. Such a book is intended to fulfil the need for a simplified guide to the management of bone and joint injuries.

On account of the increasing frequency and severity of highway accidents physicians should be well informed as to the management of injuries. The immediate treatment should be in accordance with accepted present day methods. A satisfactory result for the greater part depends on the intelligent use of general principles.

Although much improvement has been accomplished by the use of certain standardized procedures for fractures, the importance of individualization should be kept in mind and the form of treatment chosen only after a complete examination of the patient.

A small proportion of fractures requires open reduction, and for this reason description of operative technic has been limited to skeletal traction and subcutaneous leverage.

The use of plaster of paris is recommended, and plaster technic is explained in detail, as this is a form of immobilization which can be used universally. Careful follow-up treatment is as important as the reduction of a fracture.

A practical consideration of the subject will be of distinct advantage to the undergraduate in supplementing the course of didactic lectures, and the same arrangement will be of value to physicians in general practice.

Conditioned Reflexes and Neuron Organization. By Jerzy Konorski, Head of the Department of Neurophysiology in the Nencki Institute of Experimental Biology and Professor in the University of Lodz. Translated from the Polish Ms., under the Author's Supervision by Stephen Garry. Cambridge Biological Studies. General Editor: C. H. Waddington. Cloth. Price, $4. Pp. 267, with 18 illustrations. The Macmillan Company, 60 Fifth Ave., New York 11; Cambridge University Press, Bentley House, 200 Euston Road, London, N.W. 1, 1948.

This is the most recent publication on neurophysiology and is excellent. The author worked for many years under the guidance of Pavlov in Leningrad. He has attempted to extend the Sherrington conception of the functioning of the nervous system to the field of higher nervous activity. This was done on the basis of enormous experimental material collected by the Pavlov school. Konorski believes that the doctrine of Pavlov is not entirely correct and has accepted the Sherrington principle of neuron excitation with a few reservations. The author has assumed that the elaboration of a conditioned reflex consists in the formation of new functional connections in the brain. Further, he states that if a combination of excitations which results in aplastic change is not repeated a greater or lesser regression of this change occurs (atrophy of the synaptic connections. Further, he assumes that internal inhibition consists in the formation of new synaptic connections of an inhibitory character, independently of the already existing excitatory synaptic connections. The author hopes that his work will do something to abridge the gulf between the Sherringtonian and Pavlovian concepts. This book is for the neurophysiologist primarily but the reviewer feels that it should be in the hands of all neurologists.

The Literature on Streptomycin 1944-1948. By Selman A. Waksman. Cloth. Pp. 112. Rutgers University Press, New Brunswick, N. J., 1948.

This small book is merely a bibliography, without abstracts or comment, of the published papers on streptomycin from the date of its discovery until late 1948. The references are arranged in approximate chronologic order and there is an author and subject index. Included in the book is a reprinting of the paper which appeared in the *Proceedings of The Society for Experimental Biology and Medicine* in 1944 announcing the isolation of streptomycin. This book will have usefulness only to those working in the field of antibiotics.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

TREATMENT OF ALCOHOLIC MENTAL DISORDERS

To the Editor:—A 42 year old white collar worker, a known alcoholic addict, suddenly became extremely agitated and wildly violent. Seventy-two hours after the onset of this acute excitement, while under restraint, the patient suddenly died.

Assuming that the physical and neurologic status was essentially negative just prior to this sudden death, following shortly after a violent struggle, what might have been the probable cause of death? What is the accepted and recognized treatment of a known alcoholic addict who suddenly becomes psychotic, and who are the authorities?

Leon Freedom, M.D., Baltimore.

ANSWER.—Brains of patients who have died from acute alcoholism reveal acute edema of the brain substance. Chronic alcoholic addicts are more likely to have subdural hemorrhage associated with vitamin C deficiency or from trauma (Alexander, L.: *Quart. J. Stud. on Alcohol* 2: 260-262, 1941).

The symptoms enumerated in this query are insufficient to classify the type of alcoholic psychosis. The history, of course, suggests delirium tremens. The diagnosis for this condition would have strengthened by further observations of evidence of visual hallucinations and tremor. However, it must be remembered that delirium tremens usually develops in alcoholic addicts who have had acute infections or trauma, and that uncomplicated delirium tremens probably is never fatal when cardiac factors are taken care of (Bowman, K. M., and Jellinek, E. M.: *Quart. J. Stud. on Alcohol,* 2: 312-390, 1941).

Korsakoff's psychosis is characterized by anterograde amnesia, confabulation, usually polyneuropathy, associated with nutritional deficiencies but may be ushered in with delirium tremens. Mortality rates of from 25 to 50 per cent have been reported but these figures should have a favorable revision when vitamin therapy is used.

The history in this case does not justify a diagnosis of alcoholic hallucinosis. This type of psychosis is probably schizophrenia in an introverted alcoholic addict. The mortality is low.

The treatment of alcoholic mental disorders is given on pages 350 to 356 in the cited article by Bowman and Jellinek. They cite the methods and results of treatment used by forty-six authors. The principles of treatment are summarized as follows:

1. Withdraw alcohol abruptly.
2. Give sedative medication judiciously, paraldehyde preferred, and morphine condemned.
3. Omit restraints unless absolutely necessary.
4. Give carbohydrates in large quantities.
5. Administer sodium chloride in an attempt to combat dehydration and to restore normal acid base equilibrium.
6. Provide a high calory, high vitamin diet.
7. Force fluids.
8. Do lumbar punctures for diagnostic purposes only.
9. Treat complicating and precipitating factors with specific therapy.
10. Give psychotherapy according to the needs of the patient.

Probably the most satisfactory additional treatment is the use of dextrose with insulin (Vassaf, E. G., and Hall, V. R., Jr.: Tonic Effect of Insulin in Acute Alcoholism, *Arch. Neurol. & Psychiat.* 58: 94-97 [July] 1941. Thimann, J., and Peltason, P.: *Quart. J. Stud. on Alcohol* 7: 506-517, 1947).

PARTIAL PRIAPISM

To the Editor:—Please discuss treatment of partial priapism in a 30 year old man; penis is maintained in a constant semierect position. At intercourse penis assumes a more erect position but still is below normal. Prostatic examination and laboratory findings are negative. Symptoms began four months ago after a moderately severe blow in the perineal area.

M.D., California.

ANSWER.—This condition may well be a partial priapism due to thrombosis of one or both corpora cavernosa following trauma to the perineum. This would account for the constant semierection and also the incomplete erection of the penis during intercourse.

If pain is associated and the priapism progressive early surgical incision of the involved corpora and evacuation of clotted blood and thrombi is indicated. However, the elapsed time of more than four months probably contraindicates this treatment in this specific case, since the thrombosis does not appear to be progressive and organization of the thrombosis occurring at the time of trauma surely would be nearly complete by this time.

CIRCULATION TIME TEST

To the Editor:—Of what value is the rapid intravenous injection of calcium gluconate in determining the efficiency of circulation in a moribund 41 year old man? In this patient congestive heart failure developed after rheumatic fever in childhood. He had a cor bovinum. Three months prior to this test he had complete decompensation with some edema, enlargement of the liver and moisture in the lungs. He was treated by mercurial diuresis, six weeks' hospitalization, and careful digitalization. He recovered, but a second break in compensation occurred three months later. The test was performed at 6 p. m. Twelve hours later he died. It is my opinion that substances like calcium gluconate if administered rapidly would cause a speed shock. This patient had a fibrillating pulse of 130 at the time the test was done. It took thirty seconds to produce a hot flash and a tingling of the upper lip. Is there any justification for this test in a patient in such a precarious condition? Is the test of material value? Is it safe to inject calcium gluconate at the same speed as oxophenarsine hydrochloride?

Hyman J. Schorr, M.D., Chicago.

ANSWER.—Measurement of the circulation time is often a valuable aid in the differentiation of heart failure from such conditions as bronchial asthma, emphysema, hepatic enlargement or edema of other pathogenesis. In the case cited measurement of the circulation time would probably be of little practical value, for the clinical picture unequivocally bespeaks heart failure.

There appears to be no obvious reason for connecting the injection with the death that occurred twelve hours later. Calcium gluconate may be injected at the same speed as oxophenarsine hydrochloride. It should not be injected intravenously into a digitalized patient because of the danger of synergistic action.

INTRAUTERINE RADIATION

To the Editor:—Is it true that the Friedman test at or after menopause will frequently be false positive in result? Please explain. What is the mechanism of hemostasis in the intrauterine use of radium for metrorrhagia? Is the amenorrhea produced by 2,500 milligram-hours, for example, due to endarteritis of the endometrial vessels or to the depressing effect on the ovary or both?

M.D., California.

ANSWER.—A positive reaction to Friedman test, like a positive Aschheim-Zondek reaction, depends on the presence in the urine of large amounts of luteinizing hormone. Urine from pregnant women contains a large amount of this hormone and when injected into a rabbit brings about the formation of corpora lutea or corpora hemorrhagica in the ovaries of the rabbit. Occasionally the urine of women in the menopause contains sufficient gonadotropic hormone to bring about changes in the ovaries of rabbits which may simulate those induced by urine from pregnant women or produce changes in the ovaries which may be misinterpreted as being due to pregnancy urine.

The action of radium is primarily on the endometrium and consists of fibrosis of the intima of the endometrial blood vessels. The ovaries are not damaged much because of the distance from the center of irradiation. Roentgen therapy, on the other hand, produces its favorable effect in cases of uterine bleeding chiefly by means of destruction of ovarian function.

The amount of radiation therapy mentioned in the query—namely, 2,500 milligram-hours, is too high. In most cases the desired effect can be obtained with 1,200 to 1,800 milligram-hours.

WAR MELANOSIS

To the Editor:—Sporadic cases of melanosis which develops on the faces of women have been reported throughout Japan during and after the war. A study of 68 cases in our clinic did not reveal evidence of the cause of the disease. Cases were common among women between the ages of 18 and 54. It occurred most frequently among women in the thirties. The lesions are symmetric, diffuse and darkly pigmented. Many occurred after the inflammatory symptoms (itching and desquamation). Lesions occurred during the summer or autumn. It was suspected that the disease might be due to dysfunction of the endocrine system, photosensitization, disharmony of vegetative nerves, stimulants found in food or irritation by coal tar preparations in cosmetics. Effective treatment is unknown. This disease resembles closely Riehl's melanosis but could not be considered identical as it is limited in age and sex. I wish to classify the disease in the group of war melanoses and call it "melanosis facici feminea." War melanosis occurred mostly in the defeated countries in the first world war. What is the situation regarding this disease in your country?

M.D., Japan..

ANSWER.—There have been no cases of a similar nature reported in this country. The cases seen in Japan are probably examples, as the author notes, of war melanosis similar to the Austrian Riehl's melanosis of World War I. The condition was attributed to a number or a combination of factors such as substitute materials in baking, photosensitization and impurities in cosmetics.

WOUNDS CONTAMINATED BY BERYLLIUM PHOSPHORUS

To the Editor:—I have had under my care since the end of February 1948 a patient who cut his hand on a broken fluorescent electric light globe during February. The laceration was in the hypothenar eminence of the right hand, on the ulnar border. This laceration was approximately 1 inch (2.54 cm.) in width and penetrated into the hand about ¾ inch (1.9 cm.). Foreign body was not present in the wound. The wound was closed, but it soon became obvious that it was not healing properly. Purulent discharge was minimal. The wound was opened, and gradually a large mass of granulation tissue appeared. Repeated probing of the wound did not reveal a foreign body. The granulation tissue was cauterized and still the wound did not heal. A course of roentgen therapy was given which seemed without beneficial effect. About six months after the injury the wound seemed to have healed. A mass of what appeared to be rather dense scar tissue was present in the hand. At intervals since the wound healed it has broken down, discharging only a slight amount of serous material. About one month ago I had occasion to see newspaper reports from Lorain, Ohio, concerning the discovery of cases of beryllium poisoning, apparently the result of the inhalation of dusts from a factory which processed the metal. In these reports mention was made of the failure of wounds contaminated with beryllium to heal. I then became suspicious that the lesion with which I was dealing was not healing because of the presence of beryllium on the glass with which the patient was cut. Only shortly after these newspaper reports were brought to my attention, a circular letter was put out by an association of building managers cautioning everyone handling fluorescent tubes to be extremely careful not to be cut with the glass from these tubes, because of the possibility that wounds thus sustained might not heal properly. My patient saw this report. He is now greatly worried that the injury to his hand will cause him permanent trouble. As this is an industrial injury I am especially concerned, since we anticipate seeing more of these wounds. I have looked in recent volumes of the *Index Medicus* for references concerning this condition. It seems that the pulmonary aspects of beryllium poisoning are the only ones which have been discussed. Can you give me any assistance in therapy? I have considered operating on this hand, excising the scar tissue en masse. Since such surgical treatment would produce a rather marked defect in this patient's hand I hesitate to do it, if eventual healing without operation can be anticipated. The patient is not disabled so that time is not a factor of great importance.

C. P. Doane, M.D., Fresno, Calif.

ANSWER.—Although there are many uncertainties in the understanding of the nature of beryllium action, it appears established that a number of cases of skin injury from broken fluorescent lamps have led to cutaneous or subcutaneous granulomas. Two recent publications are now cited: Skin Lesions in Persons Exposed to Beryllium Compounds (Grier, R. S., and others: *Jour. Ind. Hyg. & Toxicol.* 30:228 [July] 1948) and A Beryllium Case (Shook, C. F., and Powell, J. P.: *Indust. Med.* 17:403 [Oct.] 1948). The present consensus is that these granulomatous areas of the skin and subcutaneous tissues should be excised where practical. For diagnostic purposes the excised tissues should be examined in microscopic section for the characteristic features well described by the Grier group. At the same time other portions of the specimen should be examined spectroscopically for indications of the presence of beryllium. Wider experience, within the near future, may warrant more conservative treatment, but at this time surgical intervention appears essential. Within the past few months some, or all, fluorescent lamp manufacturers are said to have discontinued the inclusion of beryllium phosphors as a luminous factor. If true, this type of serious injury may be expected to disappear.

PROGNOSIS IN ERYTHROBLASTOSIS

To the Editor:—A married woman, 27 years of age, has been extremely nervous and depressed since the death of twins from erythroblastosis the day following their birth in July 1948. This was her first pregnancy. The mother is Rh negative and the father Rh positive (heterozygous). The laboratory report on the mother and father taken after the death of the twins showed that the mother was Rh negative and immunized, as indicated by the presence of blocking antibodies the titer of which was 1:32. This case was considered most unusual, since the first pregnancy resulted in erythroblastotic twins in the absence of previous transfusions. Adoption has been considered so that if a normal pregnancy was attempted about six months after the disappearance of all antibodies there would be less psychic shock should the second pregnancy also result in an erythroblastotic infant. 1. How long will it be before all antibodies have disappeared? 2. What are the probabilities that she will have a normal infant? 3. If she should have an erythroblastotic infant what are the chances of its surviving under the best of care?

M.D., New Jersey.

ANSWER.—Rh-Hr testing is delicate and errors are notoriously frequent except in a few central Rh testing laboratories. The titration of Rh antibodies is a difficult matter; the method has an intrinsic error of at least 100 per cent, and results from different laboratories can hardly be compared in view of the different methods of titration used. The query states that the husband is Rh positive (heterozygous). This statement is fully justified only if tests have been done on the husband's parents and one of them has been found to be Rh negative. If the statement is based on tests of the husband's blood alone—for example, the finding that he belongs to type Rh$_1$rh (type Rh$_1$,hr' positive), the assumption that the husband is heterozygous may be incorrect. Assuming that the titration of "blocking" antibodies has been correctly done, the evaluation of the titer is still not possible, since the method of titration is not specified—whether by the blocking method, plasma conglutination method, albumin-plasma conglutination method, antiglobulin technic (or developing technic). A titer of 32 units by the original blocking technic would correspond to the phenomenally high titer of about 1,000 units by the albumin-plasma technic or "developing" test. A titer of 32 units by the albumin-plasma technic often spells an unfavorable prognosis.

1. The length of time which it takes for antibodies to disappear depends mainly on the titer. When the titer is high, e. g., 1,000 units, the antibodies will as a rule persist for life, though there is a gradual decline in titer with time, and such a woman when she bears an Rh-positive fetus is usually doomed to have an early stillbirth. If the antibody titer is low, e. g., only 4 units, the antibodies may no longer be demonstrable in the patient's serum after a lapse of two years or longer.

2. The probabilities of having a normal infant depend mainly on the probabilities of carrying an Rh-negative fetus. If the husband is heterozygous then there is a 50 per cent chance of having an Rh-negative baby which would be free of erythroblastosis. If the husband is homozygous, then every baby will be Rh positive and subject to the effects of the maternal Rh antibodies. However, even an Rh-positive baby may prove to be normal when the titer of the maternal Rh antibodies is low. Actually, such babies are usually really erythroblastotic with "coated" red cells, but the manifestations are so mild that without the aid of careful laboratory studies the babies are passed as normal.

3. The chance of an erythroblastotic baby's surviving depends primarily on the height of the maternal antibody titer, though there are other factors of unknown nature which seem to affect the outcome. If the maternal titer of univalent Rh antibodies is high and present from the beginning of pregnancy, the fetus will probably die in utero before reaching the period of viability. If the titer is low, the baby can usually be carried to term and then may be saved by treatment with repeated transfusions of Rh-negative blood or by exchange transfusion. With higher antibody titers premature delivery and treatment by exchange may be necessary to save the baby. If the titer is low initially but suddenly rises to a high level after the fetus reaches the period of viability, the baby may still be saved by prompt delivery and immediate treatment by exchange transfusion. Each case must be individualized, but the history of a stillbirth or neonatal death from erythroblastosis is always a serious prognostic omen for future Rh-positive babies.

ICHTHYOSIS

To the Editor:—A 10 year old white boy is essentially in good health except for ichthyosis, which he has had since birth. He has a family history of this dermatologic condition. Please outline a plan of treatment including new therapeutic measures.

Bernard M. Ailts, M.D., Sweetwater, Texas.

ANSWER.—Mild cases sometimes clear up at puberty; others sometimes respond to the administration of vitamin A, and a few may respond for a time to the administration of thyroid substance. The skin should be anointed with a mixture of 1 or 2 per cent salicylic acid or 3 per cent sodium chloride in an oily base. The bath water should be softened by the addition of a starch preparation; the patient should use a mild soap or a soap substitute, and his clothes should be heavy enough to keep the body warm.

THERAPY OF HERPES ZOSTER

To the Editor:—What is the value of vaccination for herpes zoster?

M.D., Wisconsin.

ANSWER.—A specific treatment for herpes zoster is lacking. Many forms of therapy have been successful in numerous cases, but not in all cases. Vaccination is not effective. Before vaccination is used the following forms of treatment are recommended in the order named: (1) During acute stages one should apply soothing substances to the lesions, such as calamine lotion or powders. (2) Intramuscular injections of pituitrin may cure the patient or give considerable relief of pain. (3) Roentgen therapy has given many patients relief. (4) Cobra snake venom in doses of 1 cc. injected intramuscularly daily for ten to fourteen days. (5) Sympathectomy has been effective in postherpetic neuralgia of the face.

DRUGS IN HEART DISEASE

To the Editor:—Please describe the use of alpha-tocopherol, papaverine hydrochloride and myanesin® in the treatment of coronary and arteriovascular disease.

Irwin I. Lubowe, M.D., New York.

ANSWER.—Alpha-tocopherol is without benefit in the treatment of coronary or peripheral vascular disease.

Papaverine is used orally (100 to 200 mg. four times a day) or intravenously (65 to 100 mg.) for relief of pain in coronary insufficiency and coronary thrombosis. It is of value in suppressing ectopic pacemakers especially in coronary disease. It has also been shown to be of benefit in the treatment of massive pulmonary embolus with cor pulmonale (30 to 100 mg. intravenously injected slowly over one to two minutes) and in arterial occlusion (intravenously or intra-arterially proximal to the occlusion). It has no place in the treatment of chronic arterial disease.

Myanesin® (3-ortho-toloxy-1, 2-propanediol) is not a cardiovascular drug. Improvement following its use in the posthemiplegic state is on a neuromuscular, not a vascular basis.

INDUSTRIAL EXPOSURE TO LEAD

To the Editor:—Is there a method of preventing the symptoms of lead poisoning in those exposed to lead, for example workers in the storage battery industry. The average blood lead is 0.079 mg. per hundred cubic centimeters and the urinary lead excretion 0.123 mg. daily. Clinical symptoms are absent. The usual industrial safety measures are being observed. Can dicalcium phosphate or any other medication be employed to prevent the development of clinical symptoms?

Arnold Stanton, M.D., Richmond Hill, N. Y.

ANSWER.—The figures cited are not necessarily indicative of an intake of lead into the body. As high as 0.13 mg. in 100 cc. of blood has occurred in normal persons. Usually no significance is attached to a blood content less than 0.08 mg. per hundred cubic centimeters. As to the urine, the figure cited is with respect to the total daily output rather than to any fixed urinary quantity such as a liter. Customarily, any lead excretion below 0.1 mg. per liter is regarded as of questionable significance. If, in the present situation, abnormal quantities of lead are present, prevention of prospective damage may best be averted by further diminution in exposure. In the battery industry and particularly with respect to battery plate work, some lead may be present in the air. This may be inhaled, and some may be present on hands and garments and thus carried into the mouth. In this industry, any amount of mechanical protection is insufficient in the absence of intelligent workers and personal cooperation. Routine use of drugs or other chemicals is not regarded with favor in the prevention of lead poisoning among those harmfully exposed. Some merit may exist in well balanced diets, including milk as one item, and the avoidance of respiratory infections and alcoholic bouts. Shift in work duties for workers in whom lead poisoning appears imminent may be desirable. However, best results may be expected from the full elimination of significant exposure.

OXYGEN EXCLUSION TEST IN CORONARY DISEASE

To the Editor:—Please comment on the reliability of the oxygen exclusion test for the determination of the presence of coronary spasm, angina. If the reaction to the test is considered negative can one exclude angina as being due to coronary spasm? Is the test accepted by cardiologists and insurance companies?

M.D., West Virginia.

ANSWER.—The oxygen exclusion test for coronary heart disease is reliable if positive, provided one follows the criteria laid down by Dr. Robert Levy (Levy, R. L.; Patterson, J. E.; Clark, T. W., and Burenn, H. G.: J. A. M. A. 117:2113 [Dec. 20] 1941) and Patterson, J. E.; Clark, T. W., and Levy, R. L.: *Am. Heart J.* 23:837 [June] 1942). Coronary heart disease, however, can be present in the face of negative reactions; for example, in old myocardial infarction. During the test there may be slight changes in the electrocardiogram not due to coronary heart disease. These, as a rule, can be readily differentiated from the findings with a positive reaction to the test.

OVEN STERILIZATION

To the Editor:—When advising patients to sterilize dressings in the oven what is the optimal temperature and time to be recommended?

Walter Weinberger, M.D., Altoona, Pa.

ANSWER.—Sterilization by dry heat is effected at a temperature of 302 F. (150 C.) for one hour. The period of exposure is measured from the time the temperature reaches 302 F. Avoid higher temperatures to prevent charring of materials.

TESTOSTERONE IN HYPOGONADISM

To the Editor:—I have used testosterone for hypogonadal patients with apparently good response to treatment. Is there danger that cancer will develop in the genital tract or elsewhere because of the use of repeated doses of this preparation? It has been suggested that testosterone inhibits the normal functioning of the testicles, making continued use of testosterone necessary. Does the evidence support this latter statement?

M.D., Iowa.

ANSWER.—Experimental or clinical evidence is lacking to support the hypothesis that testosterone given to hypogonadal or climacteric males as replacement therapy will—in the absence of preexisting carcinoma in the genital tract—act as an etiologic agent in producing carcinoma there or elsewhere in the body. One should rule out as much as possible carcinoma of the prostate in those patients receiving this drug and carefully note any changes in the prostate which may be suggestive of cancer by frequent rectal examinations throughout the course of such therapy. In the event of suspicious changes of the prostate rectally, testosterone should be discontinued.

It is generally recognized that testosterone does not stimulate spermatogenesis. On the contrary, in patients with normal spermatozoa counts prolonged use of testosterone may induce azoospermia. This supports the physiologic concept that use of a hormone secreted by a gland of internal secretion tends to inhibit the function of that gland. Testosterone therapy therefore should be restricted to those patients in the climacteric, the true hypogonadal patient in whom the gonadotropic pituitary factor is of no value, or as a possible therapeutic test in differentiation of true hypogonadism from anxiety states.

TUBERCULOSIS AND COCCIDIOIDOMYCOSIS

To the Editor:—In Queries and Minor Notes (the Journal, January 1, p. 68) the following answer is given: "Coccidioidomycosis has been found in practically every part of the United States in persons who have not left these areas. There are certain parts of the country where the disease has a high incidence; namely, the desert regions of the West and the valley regions of California. The infection is common in these areas and rare in other regions of the country."

The phraseology of the answer, which probably does not convey the intent of the author, undoubtedly was to emphasize that the infection may be encountered in any physician's practice. It is true that the literature is confused by cases reported as coccidioidomycosis in which diagnoses were erroneous. For instance, 1 human and 1 animal case reported as originating in Canada most certainly were not coccidioidal. Moreover, cases reported as originating in various areas of the United States merely excluded association with the endemic area of the San Joaquin Valley of California. The broader endemic area indicated below was not comprehended and thus not excluded.

Few diseases occur in which there are such sharply defined endemic areas. Except in laboratory infections, one should be able to trace an association of bona fide coccidioidomycosis with an endemic area. If one cannot, it is probably because of some exotic association which is missed. This oversight is easy, for infections have been acquired merely by automobile and train travel through endemic areas or by handling dusty clothing or dusty products contaminated with the spores of the fungus. In the United States, as is indicated in the answer, it is the arid Southwest. The area includes western and southern Texas, southern New Mexico, probably the southwestern corner of Utah, the southern tip of Nevada, central and southern Arizona, the southern San Joaquin Valley of California and spottily the adjacent counties including arid areas in southern California as well as the eastern section of coastal counties which border the San Joaquin Valley. Thus, "the valley regions of California" is not accurate either, for most Californian valleys are not involved. For instance, even the northern part of the San Joaquin Valley and all the contiguous Sacramento Valley are not endemic areas.

Knowledge of the endemic areas is useful in suggesting the inclusion of coccidioidomycosis in differential diagnosis.

Charles E. Smith, M.D., San Francisco.

ENCEPHALITIS IMMUNIZATION

To the Editor:—My attention has been called to a brief answer you have given to a question listed on page 1130 of the issue of The Journal dated Dec. 11, 1948, under the title "Encephalitis Immunization." The answer states that "immunization against the Japanese type of encephalitis is still in the stage of animal experimentation and has not been applied to human beings."

Although the first part of this answer may be more or less correct, the second part does not take into account the extensive attempts to immunize against the disease which have been carried out by the U. S. Army in Japan and Okinawa. Dr. A. B. Sabin has reported, in the issue of The Journal dated Feb. 1, 1947, pages 281-293, in his summary that Japanese B encephalitis mouse brain vaccine was administered to 60,000 to 70,000 of the military personnel stationed in the northern part of the island (Okinawa), in 1945.

I should also call your attention to War Department Technical Bulletin 181 published on April 6, 1947 entitled "Japanese B Encephalitis," which describes the vaccination for human beings in this disease.

I do not claim that these comments of mine answer the question asked by Dr. Harold B. Keyes, nor are they meant to imply that the degree to which the human vaccination procedures actually immunize is known, but they do amplify your answer.

John R. Paul, M.D., Yale Univ. School of Medicine.

CARDIOVASCULAR REJECTEES

A Follow-Up Study

PAUL D. WHITE, M.D.
Boston
ROBERT L. LEVY, M.D.
New York
WILLIAM J. KERR, M.D.
San Francisco
WILLIAM D. STROUD, M.D.
Philadelphia
and
GEORGE K. FENN, M.D.
Chicago

One of the most useful methods for the determination of the significance and importance of symptoms and signs and of the accuracy of their appraisal is the follow-up study of the subjects in whom they are observed.

In 1943, reports[1] were published of the reexamination of 4,994 men disqualified for general military service in the armed forces of the United States of America, during World War II by local boards and induction stations, because of the diagnosis of cardiovascular defects. This was a combined study made by special medical advisory boards, consisting of cardiovascular experts in the five cities of Boston, Chicago, New York, Philadelphia and San Francisco, with the invaluable cooperation of the state and city directors of Selective Service. The reader is directed to the original reports for the description of the plan of procedure, the names of the members of the various teams and the details of the findings. For convenience, however, the more important data and the most significant conclusions of these reports will be presented herewith as background for the follow-up study made in 1947.

The chief reasons for the reexamination in 1943 were to determine (*a*) the problems in cardiovascular diagnosis that particularly concern the range of the normal cardiovascular system with respect to service, (*b*) the possible salvage of men for the army by reclassification as 1A[2] and (*c*) the comparison of opinions of cardiovascular experts with those of the examiners of local boards and induction stations to determine the desirability of such reexaminations in this or other special medical fields throughout the country.

Of the total number of 4,994 cardiovascular rejectees reexamined in 1943, 863 (17.3 per cent) were resubmitted as 1A. Chicago yielded the lowest salvage (3.88 per cent), probably because cardiovascular experts had already been freely used in the decision about doubtful cases, a worth while example to follow and one that would obviate the need of such full scale reexaminations in the future.

In 1943, there were eight problems of particular interest which remained unsolved and were in need of follow-up study.[1b] They were as follows:

> . . . (a) the interpretation of apical systolic murmurs (may they, if very slight or even slight, in the absence of any other abnormal or doubtful finding, be considered inadequate reason for rejection?); (b) the upper limits of the normal blood pressure (may the systolic pressure in very nervous young men be set perhaps as high as 160 mm. Hg. or even a shade more, provided the diastolic pressure does not exceed 90 mm. Hg.?); (c) the limits of the normal pulse rate at rest (may there not be a wider range, say from 40 to 120 per minute, than that actually given in the current criteria?); (d) the heart size, which also varies widely, especially according to body build, and may perhaps in a few normal individuals exceed the standards set by Hodges and Eyster; (e) the electrocardiogram, of which the wide range of normal has not yet been explored adequately; (f) neurocirculatory asthenia, difficult to diagnose in mild degree, but probably rejectable even when slight, unless there is an obvious cause which can be corrected; (g) recent rheumatic fever, a hazard even when the heart seems perfectly normal; and (h) exercise tests, the usefulness of which, in cardiovascular examination for military service, is open to question.

Finally, it was predicted that

> *A follow-up study of the men reclassified as 1A and especially of the doubtful "borderline" cases in the final 4F*[3] *group should, in the years to come, aid in solving some of the various problems in cardiovascular diagnosis that still remain.*[1b]

It seemed appropriate to make a first follow-up study in the spring of 1947, four years after the first reexamination study and long enough after the end of the war to assess the effects both of the war itself and of the postwar adjustment. This was done in the case of as many of the men who had been resubmitted as 1A in 1943 as could be reached in 1947. Some of the men who still present diagnostic problems should be followed up again in the future.

Because of lack of space this article has been abbreviated in The Journal. The complete paper will be found in the authors' reprints, which the authors will be pleased to send on request.

The work described in this paper was begun under a contract recommended by the Committee on Medical Research, between the Office of Scientific Research and Development and Columbia University. The contract was transferred on Nov. 1, 1945, from the Office of Scientific Research and [illegible] Research and Development Board, Office of the [illegible]

[1] (*a*) Le[illegible] and White, P. D.: Report of Reexaminatior[illegible] for General Military Service, J. A. M. A. [illegible] (*b*) Fenn, G. K.; Kerr, W. J.; Levy, R. L.; [illegible] P. D.: Reexamination of 4,994 Men Rejected for General Military Service Because of the Diagnosis of Cardiovascular Defects: Individual Reports by the Chairmen of Special Medical Advisory Boards in Five Cities in Which the Combined Study was Made, Am. Heart J. 27:435 (April) 1944.

[2] The classification 1A, as used in this discussion, denotes fitness for full military duty with respect to the cardiovascular system. It does not exclude disqualification for other medical defects.

[3] The classification 4F in this report denotes unfitness for any military service because of cardiovascular reasons.

Of special "borderline" cases, of which there were 114 in Boston labeled "1A liberal," but not resubmitted for military service, 67 were also followed and will be discussed in an appendix to the present report; they formed an especially interesting group.

PRESENT FOLLOW-UP STUDY

The plan of procedure of examination in the five cities of Boston, Chicago, New York, Philadelphia and San Francisco in 1947 was essentially the same as in 1943, the standards used were identical in order to permit adequate comparison, and with rare exceptions the teams consisted of the same personnel, both medical and lay. As before, the directors of Selective Service were most helpful.

On this occasion, however, fewer of the men were available for two reasons: First, they came entirely voluntarily and many had had their fill of examinations; second, many had moved away, either from their original addresses in the cities in question or to other parts of the country. Nevertheless, an adequate number was reexamined to afford information of value: 134 in Boston, 93 in New York, 39 in San Francisco, 29 in Philadelphia and 8 in Chicago, a total of 303. Of this total of 303, all but 49 had been admitted to military service; of these 49 who were exempted a second time, 28 were rejected for medical reasons (mostly noncardiac) by the induction station or local board, and the other 21 were excluded for other reasons. The great majority of those admitted to the armed forces were finally discharged without disability after an average of two and one-half years of military service.

Among the 227 men reexamined in Boston and New York in 1947, 178 had been admitted to military service. Of these, 37 were discharged as disabled after an average of one year. Of these 37, there were 23 with noncardiac diagnoses and 14 with cardiovascular labels; the latter included "hypertension," "valvular disease," "coronary disease," "neurocirculatory asthenia" and "uncertain."

Several of the men reexamined had been wounded (10 from Boston and 2 from New York), and several had been decorated for valor. Of the originally resubmitted "1A group," 8 were killed in action.

At the time of follow-up study in 1947 almost all the men reexamined were in excellent or good health (259 of the 303) and were working. Several of those not working could not find jobs or were students. Only 4 were actually disabled.

The range of age of these men, four years older than at the first reexamination, was from 23 to 42, averaging about 30.

THE PARTICULAR CARDIOVASCULAR FINDINGS

The problems referred to in the 1943 report will be discussed in sequence.

A. Murmurs.—Although not the most difficult of the findings to assess, cardiac murmurs were the commonest. Armed with the established fact that very slight to slight systolic murmurs at the apex and pulmonary valve area can be within the normal range and are not to be construed as evidence of heart disease unless there are other associated signs, in particular cardiac enlargement, the special boards did not have much difficulty in assessing their significance and importance. A murmur of this type can be produced, for example, by the speeding up of the circulation through exercise in a perfectly normal young person who shows no murmur at all on rest. In many of the young men in question, there was also at the time of examination a certain amount of nervous stimulation which could act in a similar manner.

The loudness of murmurs has been shown to be clinically significant,[4] and so an attempt was made in some of the cases in this study to record the loudness and to assess the murmurs accordingly. In Boston, the examiners graded the murmurs on a scale of five (grade 1, very slight; grade 2, slight; grade 3, moderate; grade 4, loud; grade 5, very loud) and noted that the comparison of the intensities of the murmurs in 1943 and in 1947 was easier in consequence. Slight (grade 2) systolic murmurs at the apex are borderline or open to careful scrutiny, as is also true of systolic murmurs of moderate intensity (grade 3) at the pulmonary valve area, especially when the pulmonary second sound is unduly accentuated. Aortic systolic murmurs were much less common in our examinees, as they are in normal young men in general, and doubtless should be considered abnormal when more than very slight (grade 1) in intensity. Diastolic murmurs anywhere were adjudged abnormal.

The commonest cause of abnormally loud systolic murmurs in young men is rheumatic heart disease, and here either valvular deformity or cardiac dilatation, or both, may be responsible. Congenital cardiac defects and other causes are relatively rare. An attempt was made to diagnose the etiologic factor behind overloud murmurs. In only 4 cases of the 303 was a diagnosis of valvular ("rheumatic") heart disease made in 1947, and in at least 1 of these rheumatic fever was known to have occurred during military service. In 6 other cases the diagnosis of questionable valvular heart disease was made in 1947 on the basis of some increase in the loudness of murmurs.

Thus, although prior to our first reexamination in 1943 the commonest diagnosis causing the original rejection by local boards and induction stations of the men resubmitted by us as 1A was valvular ("rheumatic") heart disease, the present four year follow-up has not indicated that the problem is an important or difficult one for the cardiovascular expert. Future follow-up studies of cases of murmurs are, to be sure, still in order, but the evidence to date indicates the considerable value in the way of salvage of using cardiac consultants in the original appraisal of doubtful auscultatory findings.

Actually, murmurs were found to be common among these young men, but such murmurs were very slight (grade 1) or at most slight (grade 2) and almost entirely limited to the cardiac apex and pulmonary valve area. For example, in Boston among the 134 men examined, 79 (59 per cent) had murmurs and in only 2 was valvular heart disease diagnosed, 1 on the basis of slight mitral and aortic diastolic murmurs which had appeared since 1943 and the other on the basis of a grade 2 aortic systolic murmur. Of the other 77 men, 58 had apical systolic murmurs in 1943 or 1947, on both occasions in 29 instances (44 per cent of the 131 men without heart disease), while only 8 had aortic systolic murmurs, in 3 of whom the murmur was heard in both 1943 and 1947. There were also a few men (11) with very slight or slight "precordial" systolic murmurs and many with the unimportant pulmonary systolic murmur. It is of much interest that many of these murmurs were heard on only one of the two occasions. Thus, murmurs heard in 1943 and not in 1947 could be truly labeled as transient—there were 28 such cases; in only 2 of them was the murmur more than very slight.

---

[4] Baker, L. A.; Sprague, H. B., and White, P. D.: The Clinical Significance of Loud Aortic and Apical Systolic Heart Murmurs Without Diastolic Murmurs, Am. J. M. Sc. 206: 31 (July) 1943.

In New York, an apical systolic murmur was heard in 37 of the 93 men reexamined in 1947, and in 30 instances these murmurs had been heard also in 1943, while in 7 men an apical systolic murmur heard in 1943 was no longer detected in 1947. Thus, a total of 44 (47 per cent) of these men showed such a murmur in either 1943 or 1947 or both. For 2 of the men in whom murmurs were heard in 1947, the diagnosis was "rheumatic heart disease." In 2 of those with apical systolic murmurs in 1947, very slight aortic systolic murmurs were also heard, but no diastolic murmurs at all were encountered.

Similar experiences were noted also in the other cities.

B. Blood Pressure.—The most difficult problem and one that remains unsolved by our more recent reexamination is the appraisal of "borderline" blood pressure levels. These are readings a little over 150 mm. mercury systolic or 90 mm. diastolic, especially the former, when they occur transiently, that is, at the beginning of the examination followed by subsidence on quiet rest for a half hour. It is true that the study which was carried on during the recent war [5] of the annual blood pressures of 22,741 officers in the United States Army recorded over a period of many years showed a distinct tendency for the establishment of permanent hypertension and eventual cardiovascular disability among those showing transient hypertension in their earlier years, especially when they were also overweight and showed transient tachycardia; nevertheless, there were many men among those officers who, following the occurrence of transient hypertension, never showed permanent hypertension. That, in general, appears to be the finding in the present study, but the number is small and the period of follow-up is short, so that further observation of our cases after longer intervals will be necessary to discover what features distinguish the two groups.

Of 67 men among the total of 303 who showed transient hypertension in 1943, 33 had normal blood pressure readings in 1947, 17 still showed transient hypertension and 17 were found to have sustained hypertension; the Boston figures were 8, 9 and 13, respectively, and those from New York were 17, 6 and 3. Of those with normal blood pressure readings in 1943, 13 showed transient hypertension in 1947 and in 10 others sustained hypertension had developed. Incidentally, there were 5 men in 1943 who did not quite achieve the normal limits after resting and who showed normal levels in 1947, either at once (2 cases) or after resting (3 cases).

An attempt has been made to note correlations in these cases of borderline blood pressure with weight and pulse rate, but the results to date are not conclusive. Among the 8 men in Boston with transient hypertension in 1943 and normal blood pressure readings in 1947, 3 were overweight and had gained more weight over the interval of four years. Two of the 8 had transient tachycardia in 1943, and 1 showed transient tachycardia in 1947. Of the 13 men in Boston with transient hypertension in 1943 who showed more sustained hypertension in 1947, 7 were overweight and several had gained a great deal, namely 39 pounds (17.7 Kg.), 26 pounds (11.8 Kg.) and 31 pounds (14.1 Kg.). Five of these 13 had had transient tachycardia in 1943 and 8 showed transient to sustained tachycardia in 1947. Of the 9 Boston men with transient hypertension in 1943 who still showed transient hypertension in 1947, 6 were overweight, 1 showed tachycardia in 1943 and 1947 and 1 showed tachycardia in 1947. Of 6 men in the Boston group with normal blood pressure in 1943 who showed transient hypertension in 1947, 3 were overweight, 1 showed transient tachycardia in 1943 and also in 1947 and another showed transient tachycardia in 1947. Of 6 persons with normal blood pressure in 1943 who showed sustained hypertension in 1947, all were overweight and 1 showed transient tachycardia on both examinations.

Two of the men with transient hypertension in 1943 who showed normal blood pressures in 1947 had a family history of hypertension. Two of the 9 men with transient hypertension in 1943 and transient hypertension in 1947 had a family history of hypertension. Of the 6 with normal blood pressure in 1943 and transient hypertension in 1947, 2 had positive family histories, and of the 6 with normal blood pressure in 1943 and sustained hypertension in 1947, 1 had a positive family history and 1 had a questionable family history. Of the 13 men who had transient hypertension in 1947 and more sustained hypertension in 1947, 6 had a family history of hypertension and 1 had a questionable family history of hypertension.

These findings are suggestive with particular reference to the importance of overweight, but there are obviously many exceptions and a longer follow-up study will be necessary.

C. Pulse Rate.—The next problem concerns the heart rate and, in particular, tachycardia. Rates above 100 a minute were acceptable in 1943 if they slowed with rest, that is, if tachycardia was transient. Slow pulse rates, below 50, were rare and were not a problem, provided electrocardiography was available. Transient tachycardia was commoner in 1943 than in 1947; many of the men (19 of 35) showing temporarily fast pulses before had normal rates the second time, several (13) still showed transient tachycardia and only 3 had sustained tachycardia. Several men (11) with normal heart rates in 1943 showed, on the other hand, transient tachycardia in 1947, and 2 had sustained tachycardia. One of these was conspicuously obese, weighing 251 pounds (113.8 Kg.) in 1943 and 262 (118 Kg.) in 1947. Two men whose heart rates had persisted at a level slightly above 100 in 1943 showed normal heart rates and blood pressures in 1947.

D. Heart Size.—The range of the so-called normal heart size is great and as yet ill defined. In 1943, it was agreed by our examining teams that the predicted transverse diameter of the heart shadow on the teleroentgenogram according to the Hodges-Eyster stand-

ards for age, height and weight should, with rare exceptions, be used as our guide and that, if the actual measurement were more than 1 cm. greater than the predicted transverse diameter, cardiac enlargement would be diagnosed and the man excluded from the 1A group. In 1947, only 4 of the 303 men (1.3 per cent) showed an increase in heart size above the normal upper limit agreed on, although 7 others were "borderline." One of the 4 men with abnormal increase in heart size was hypertensive; the condition in the other 3 was unexplained. A number of men showed appreciably smaller measurements in 1947, including several who were "borderline" or very slightly above in 1943 (but were judged normal for their build because they had very wide chests); these decreases in size, as well as the increases in size, were usually slight and thought to be within the range of error of measurement and physiologic variation. In a few men there was some change in shape, especially an increase or decrease in the pulmonary artery shadow, sufficient in 1 to raise the question of a diseased state. In 1 man an overprominent pulmonary artery without other abnormalities was noted to be present in 1943, as well as in 1947, and raised the question of a congenital defect.

E. Electrocardiogram.—Here there was little difficulty, despite the fact that the range of the normal was wide and a few doubtful cases were encountered. Four men (1.3 per cent) showed minor changes or questionable abnormalities in 1947 not present in 1943; the causes for such changes were obscure; they could be physiologic, although rheumatic, hypertensive and coronary causes must be under suspicion. These changes consisted of some lowering of the T waves or slight changes in their shape, and in 1 man very slight widening of the QRS complexes. A fifth case showed a clearly prolonged P-R interval (0.24 second). Of 4 men with "borderline" electrocardiograms in 1943, those of 2 were unchanged in 1947, one looked a little more normal and one slightly less so. One man classified as 1A in 1943, despite a slightly abnormal electrocardiogram (low T waves in lead I) showed the same record in 1947.

F. Neurocirculatory Asthenia.—There was not much of a problem here either, in large part because of rejection of men with clearcut disease in the first place by local boards and induction stations, confirmed by our special cardiovascular examiners in 1943. Seven men were thought in 1947 to have neurocirculatory asthenia, not diagnosed in 1943, and there were 6 questionable cases.

G. Rheumatic Fever.—Despite the fact that a considerable number of the men had had rheumatic fever in the past (for the most part more than five years prior to induction), only 2, and perhaps a third, had had active rheumatism between 1943 and 1947. All 3 showed rheumatic heart disease in 1947 not diagnosed by the special examining boards in 1943. In Boston, 1 of these men was among 20 with a rheumatic history and another occurred among a similar group of 20 in New York. No men from the total group of 303 showed rheumatic heart disease who had had no history of rheumatism.

The New York experience is of special interest. Nineteen men gave a history of rheumatic fever prior to the first reexamination in 1943; one gave a history of chorea. The average time elapsing between the last episode of rheumatism and 1943 was 11.7 years; the range was from one to twenty-four years. In only 2 instances was this interval less than five years. Of these 20 men with a history of rheumatic fever, 16 saw active service, 3 were rejected for a second time after having been passed by the special board and 1 was deferred because of occupation. Two were discharged from the Army after having been in service for less than one year—with the diagnosis of neurocirculatory asthenia and 1 because of a neuropsychiatric disorder. In not a single instance in these 20 men was there a recurrence of acute rheumatic manifestations or of carditis. One who did not see service, and in whose case a diagnosis of rheumatic heart disease was made by the special examining board in 1947—a reversal of its previous opinion—said he felt occasional mild joint pains during his life as a civilian between 1943 and 1947.

Follow-Up Study of Cardiovascular Rejectees by the Veterans Administration, September 1948

REPORT OF FOLLOW-UP STUDY BY VETERANS ADMINISTRATION

Dr. Traum, Dr. Wilcox, Dr. Robb and Dr. Kistin of the Veterans Administration sent us the following summary of the men who came under their jurisdiction among the total group of 447 who were accepted for military service of the 863 men resubmitted as 1A in 1943 by the special cardiovascular boards in the five cities involved. It is hoped that those men in their lists whom we ourselves have not yet reexamined may some day be reviewed by our groups for a more complete follow-up study.

In the table is given a summary of the Veterans Administration data which adds to the information obtainable at present, although the summary includes a number of men whom we ourselves have not yet reexamined and data on whom do not, therefore, appear in our own report.

SUMMARY AND CONCLUSIONS

1. A follow-up study was made in 1947 by special cardiovascular boards in Boston, Chicago, New York, Philadelphia and San Francisco of 303 young men who had been originally rejected for military service because of diagnoses of cardiovascular disease, hypertension or neurocirculatory asthenia, but later resubmitted as 1A in 1943 after examination by these same special cardiovascular boards.

2. Certain problems are reviewed in the light of this reexamination. Heart murmurs were the commonest cause for the original rejections, but their appraisal by the cardiologists was not considered difficult. The great majority of the murmurs were variable, unimportant and physiologic in type, being heard in at least half of these healthy young men. In 4 men rheumatic heart disease developed during the four years.

3. The most difficult problem was that of the appraisal of slight elevations of blood pressure, in particular of transient hypertension (over 150 mm. systolic or over 90 mm. diastolic, subsiding after one-half hour's rest). Of 67 men showing transient hypertension in 1943, 33 showed normal pressure readings in 1947; 17 still showed transient hypertension, and 17 had sustained hypertension. Thirteen with normal pressure in 1943 showed transient hypertension in 1947, and in 10 sustained hypertension had developed.

4. Of 35 with transient tachycardia in 1943 (heart rate over 100 subsiding after one-half hour's rest), 19 showed no tachycardia in 1947. In a few cases the reverse was true. Another study has shown that transient hypertension and transient tachycardia are of about equal prognostic importance with regard to the later development of sustained hypertension.

5. Heart size as measured by teleroentgenograms showed only minor variations, up or down, between the examinations in 1943 and those in 1947. In only 4 men did definite enlargement of the heart develop.

6. Electrocardiography also presented little difficulty. There were a few borderline cases noted on both occasions, but only one showed a distinct abnormality at the end of the four years.

7. Neurocirculatory asthenia was an uncommon development over the four year period—there were 7 men whose condition were so diagnosed in 1947 who were considered to be normal in 1943.

8. Valvular lesions indicating rheumatic heart disease, not evident in 1943, were noted in 4 men in 1947. Many others gave a history of rheumatic fever in childhood or early adult life, but showed no sequelae.

9. In general, the 303 men served long and well in the armed forces, even though a few were discharged for cardiovascular reasons and, like others of the group with noncardiac disorders, are now under the jurisdiction of the Veterans Administration. Eight of the 447 original rejectees who were accepted for service were killed in action. In the group with a history of rheumatic fever in early childhood or early adult life, recurrence of activity between 1943 and 1947 was distinctly uncommon, even in those who saw active war service. In almost all, rheumatic fever had occurred at least five years before induction. Valvular lesions indicating heart disease, not evident in 1943, were noted in only 4 men in 1947.

PHYSICAL TREATMENT OF POLIOMYELITIS

Responsibilities of the Physician in General Practice

ROBERT L. BENNETT, M.D.
Warm Springs, Ga.

By choice and by necessity, the physician in the general practice of medicine is frequently called on to care for any or all phases of acute anterior poliomyelitis and must therefore be prepared to use certain diagnostic and therapeutic tools of physical medicine. This discussion will be limited to the responsibilities of the physician utilizing those tools in the care of the after effects of poliomyelitis during the convalescent stages.

No known method of treatment, chemical or physical, can appreciably alter the patterns of destruction wrought by the invasion of the virus in the central nervous system during the acute stage of the disease. The extent of recovery obtained in any individual patient still depends on the physician's ability to make the most effective use of those neuromuscular units left intact after all inflammation has subsided in the central nervous system. To this end great progress has been made, particularly in the physical treatment of the convalescent stage, but the more that is known about the treatment of the after effects of this disease during convalescence, the more difficult it becomes. The increasing success of such treatment has been due to the development of highly refined routines of care which must be carried out with great precision over long periods of time.

However, no magical formula for mixing together heat, massage and exercise has been discovered. The value of physical treatment is completely dependent on the ability of the physician first to evaluate the specific needs of his patients and, on the basis of this knowledge, then outline the individual programs of care. No physician should undertake the care of convalescent poliomyelitis unless he thoroughly appreciates the responsibilities that he must assume and the physical tools with which he must work to fulfil these responsibilities.

First of all, the physician must be able to evaluate accurately the site and extent of neuromuscular involvement. No form of treatment can be intelligently prescribed unless based on this knowledge. The strength of individual muscles and muscle groups can best be determined by the so-called manual muscle strength test. This test is one of the diagnostic measures utilized by physical medicine and is based on the ability of the patient voluntarily to contract specific muscle groups so that the bodily segments activated by these muscles move through specific planes of motion against known resistance. These tests are accurate and trustworthy only when performed by the physician or therapist skilled in functional anatomy and kinesiology.

All physicians should be able to make a consistently accurate muscle test or, at least, be able to understand thoroughly the results of such a test when done by another physician or therapist. This test is part of the data absolutely necessary for the intelligent use of such physical agents as muscle reeducation, gait training and the use of assistive, supportive and protective apparatus. Simply to permit a patient to sit up in bed might

---

Read in a panel discussion on Physical Medicine in General Practice in the Session on Physical Medicine, Section on Miscellaneous Topics at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

be extremely dangerous unless the status of the muscle groups about the trunk, neck and upper extremities is known.

At the present time, no other type of test will give us the practical information as does the manual muscle strength test. The determinations of the electrical excitability of nerve and muscle by plotting strength-duration curves, chronaxia, tetanus ratio and the like are of very limited value in the spotty type of central nervous system lesion found in poliomyelitis—except in the differential diagnosis of such conditions as the primary myopathies, polyneuritis, hysteria or malingering. Likewise, electromyographic studies have little practical clinical significance at the present time. Therefore, the evaluation of the extent and site of neuromuscular involvement which forms the basis for all treatment of poliomyelitis must depend on the physician's ability to do an accurate manual muscle strength test or accurately interpret the results of this test when done by another physician or therapist.

The physician must next be able to obtain effective action of all remaining neuromuscular units, either through his own personal use of physical treatment or through his prescription to the trained therapist. Effective use of the intact neuromuscular units can be accomplished only by therapeutic exercise in the form of specific muscle reeducation followed by the specific functional retraining of bodily segments. In the moderately or severely involved patients, such treatment must be carried out intelligently and meticulously over many months or even years. It is this phase of treatment that forms the keystone of the over-all program of care. Unless the involved muscles are trained to work coordinately and with maximum strength and endurance, the most effective use of the neuromuscular units left intact after the initial damage to the central nervous system can never be realized. No athlete in his physical endeavors ever needed a coach so much as these patients need muscle reeducation, because the patient must be assisted to achieve normal functional capacity with far less than normal numbers of available motor nerve cells and muscle fibers. Too often the parents are told that their child will "outgrow" his weakness only because the physician does not appreciate the value of skilled muscle reeducation or has long forgotten his functional anatomy and is at a loss to give or prescribe the proper care.

The physician must next be able to anticipate and correct or minimize the factors responsible for musculoskeletal deformities. Unfortunately, poliomyelitis is complicated by the tendency toward the development of pathologic sequelae caused by, but far removed from, the damage to the lower motor neurons in the central nervous system. When the function of these cell masses is lost in whole or in part, changes in the musculoskeletal system must follow. It is true that one can do nothing to prevent the weakness and atrophy that must follow actual denervation of muscle fibers, but one can and must prevent the structural changes that develop in bodily segments inadequately supported. These changes or deformities have just one cause: persistent faulty alinement of the bodily segments.

These faulty positions may occur during periods of so-called rest if the segments are held in abnormal alinement by such factors as weakness, pain and muscle spasm. Here, physical medicine combats such distortion by supporting weakened segments in normal alinement by pillows, sand bags and, when necessary, light splints that can be easily removed to permit the application of other forms of treatment. Pain can be relieved and spasm released by the intelligent use of heat, massage and passive motion. The use of hot packs has been widely advocated, but many other forms of heat, if properly applied, will give similar results. In some cases, massage is soothing and relaxing and should be used even in the acute stage. In other cases, massage is irritating and cannot be used with beneficial effects until the inflammation in the nervous system has quieted down. Passive motion is probably the most important single factor in physical treatment during the early convalescence because it helps prevent contractures of muscular, ligamentous, fascial and periarticular structures, assists venous and lymphatic circulation and establishes reflex tone in reinnervated fibers. Like all other valuable therapeutic measures, it may be harmful if used carelessly and too vigorously.

Many musculoskeletal deformities occur and/or progress rapidly because of faulty use of bodily segments during daily physical activity, particularly during the years of rapid bone growth in childhood and adolescence. All activities must be carried out with as nearly normal patterns of motion and as nearly normal alinement of bodily segments as possible if distortion of bony and other supportive structures is to be kept at a minimum. The physician must not only be capable of noting the earliest deviations from normal patterns of motion and weight bearing but must also be capable of correcting or minimizing these faults through functional training and, when necessary, the use of assistive and supportive apparatus, such as corsets, braces and crutches.

Finally, the physician should appreciate the frequent need for, and value of, certain orthopedic surgical procedures during the convalescent stage. In general, it has been stated that when orthopedic surgical treatment is indicated to correct deformity, increase functional capacity and assure future security of bodily segments, it should be deferred until the chronic stage or, in children, after bone formation is well advanced. This is only partially true. Relatively simple surgical procedures, such as tenotomies of the iliotibial band or heel cord, if done early in the convalescent program, often permit restoration of bodily alinement possible in no other way; they not only prevent irreversible and severely handicapping structural changes from taking place but also permit the more effective use of muscle reeducation and functional training.

Physical medicine must not be thought of as in competition with orthopedic surgery. It is essential that the physician caring for the convalescent phase of this disease foresee the possibilities of later surgical procedures and through his treatment maintain the involved segments in such condition that, if necessary, the surgeon can add to the patient's greater functional capacity and security at the optimum time in the over-all program for maximum rehabilitation.

SUMMARY

The physician who assumes the responsibility of the physical treatment of convalescent poliomyelitis must be prepared to: (1) evaluate the site and extent of neuromuscular involvement, (2) obtain coordinate and effective use of all remaining neuromuscular units, (3) prevent or minimize the development of musculoskeletal deformities, (4) appreciate the frequent need for certain orthopedic surgical procedures during the convalescent stage and (5) foresee and prepare the involved bodily segment for any necessary orthopedic surgical treatment in the chronic stage.

PHYSICAL TREATMENT OF BACKACHE

FREDERIC J. KOTTKE, M.D.
Minneapolis

Pain low in the back is a common reason for patients to seek medical aid. Many backaches may be diagnosed roentgenologically as resulting from congenital anomalies, bony deformities, traumatic injuries to bone, arthritic changes, metastatic tumors or, occasionally, metabolic changes. In patients with such disorders the treatment prescribed depends on the pathologic changes found. However, there is a larger number of patients in whom the backache is not due to demonstrable bony change. In many of these patients the pain may be poorly localized. Although relief of pain, to a large extent, depends on removal of the cause, the mechanism of response to injury to the back affects the intensity and duration of pain. Therefore, these responses to injury influence treatment of painful injuries of the low back.

MECHANISM OF BACKACHE

When the back is injured, whether the injury be to fibrous, muscular or bony tissue, stimulation of pain endings initiates a reflex muscle spasm causing extensive contraction of the back muscles and limitation of motion. This reflex muscle spasm or splinting appears to be protective to immobilize the injured area and allow the normal mechanism of repair to occur. The muscle spasm may be localized around the site of the injury, or it may be generalized over the muscles of the back, the hips and, often the lower extremities. Muscle spasm for a prolonged period produces pain in the muscle involved and also pain at the attachment of the muscle to bone. Therefore, one finds that when muscle spasm has been present for a time the muscle belly is tender to palpation, but often the site of bony attachment is even more tender. Almost routinely when muscle spasm has been present, there will be tenderness along the iliac crests, over the sacrum or over the vertebral spines or transverse processes where the muscles in spasm have their attachment. This tenderness is not caused by the original injury but is related to the secondary muscle spasm. Thus, the mechanism of muscle spasm, although originally protective, may aggravate and extend the painful area in the back.

It is observed frequently, when minor trauma to the back has occurred, that after several days of muscle spasm the original site of pain is nontender but the pain and tenderness induced by the prolonged muscle spasm are sufficient to maintain the cycle. Relief of muscle spasm in these cases brings prompt relief of all symptoms. Another property of prolonged muscle spasm is that fixed limitation of motion is produced. Just as fibrous tissue is laid down to form the scar in injury to the skin, so also is it laid down in injured muscle and also in normal muscles if they are immobilized. This production of scar tissue with fixation of muscle fibers progresses relatively rapidly. Frohlich and Meyer[1] reported that fibrous contractures could be demonstrated grossly in cats after only four to five days of immobilization. As the fibrous contracture is produced, the ability to extend or stretch the muscle is reduced. Stretching of this contracture is equally as painful as overstretching normal muscle. Protective muscle spasm is initiated if the contracture is stretched, and the patient involuntarily splints the synergistic muscles to protect the painful one. This involuntary limitation of motion contributes to a progressively increasing contracture.

METHOD OF TREATMENT

Treatment of low back pain has a twofold aim: to relieve the pain in the area of initial trauma and to relieve the muscle spasm and its concomitant effects. For the relief of muscle pain, heat is one of the best analgesics. All types of heat are useful to relieve deep pain or muscle spasm. Short wave diathermy is probably in general preference today because of its efficacy and ease of administration. However, it is my experience that woolen hot packs, heated in boiling water, centrifuged nearly dry and then quickly applied, are the most effective method of relieving muscle spasm.

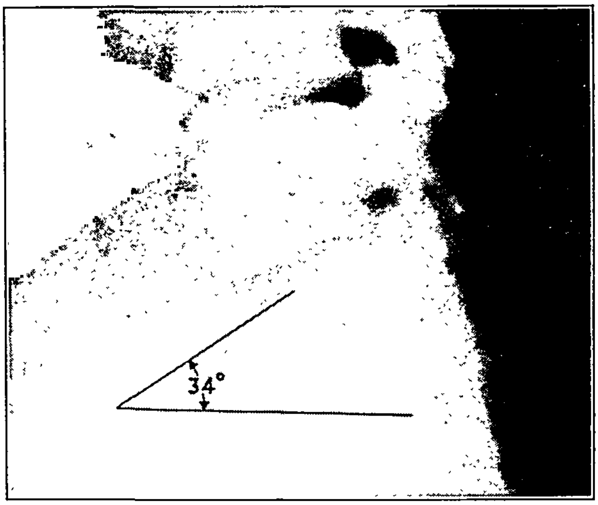

Fig. 1.—Normal back. The lumbosacral angle, the angle formed between the horizontal plane and the superior border of the sacrum, is 34 degrees (from Archer, V. W.: the Osseous System: A Handbook of Roentgen Diagnosis, Chicago, The Year Book Publishers, Inc., 1945).

These packs feel extremely hot since they are applied at a temperature of about 80 C., but because of their low water content there is too little heat to blister the skin. After the application of heat, massage is used to increase the threshold for pain and to obtain greater relaxation. Frequently, nodules may be palpated at the sites of tenderness, which disappear with massage. Whether these nodules are local areas of muscle spasm or connective tissue is difficult to determine, but as they are massaged away the tenderness diminishes. Massage is begun gently and increased in pressure gradually as the patient's tolerance increases. When massage is used in this manner, it is pleasant as well as beneficial.

Neither heat nor massage is able to stretch muscles out to their full resting length. Therefore, these forms of treatment are followed by passive or active stretching exercises to increase suppleness. Stretching exercises must be vigorous and must be designed to stretch the muscles which have been held in a shortened position. The muscles most frequently involved in backache are the erector spinae and the extensors, abductors

[1] Frohlich, A., and Meyer, H. H.: Untersuchungen über den Tetanus, Arch. f. exper. Path. u. Pharmakol. 79: 55, 1915-1916.

and flexors of the hips. However, any muscles may be involved in the individual case. Movement of these muscles through the range from full contraction to complete relaxation prevents the development of connective tissue which would tie the muscle fibers down with fibrous contractures and perhaps lead to a permanent deformity.

COMMON CAUSES OF BACKACHE

Among the conditions commonly causing backache is poor posture or relaxed posture with increased lordosis and kyphosis. Because of the more vertical position of the faces of the lower lumbar vertebrae (figs. 1 and 2), the shearing stress between vertebrae is increased and a greater share of support of the weight of the body is transferred to the muscles and ligaments uniting the vertebrae (fig. 3). This stress causes chronic pain low in the back associated with painful muscle spasm. As the muscles of the back fatigue, the lordosis, and with it the strain, becomes more pronounced. With the development of the relaxed posture the iliotibial band of fascia, which runs from the lumbosacral fascia and the iliac crests down over the lateral side of the thigh to insert below the knee, is put in a relaxed position and gradually shortens. As the iliotibial band shortens, it creates a fibrous barrier to resumption of normal posture. By fixing the lumbar part of the spine in a lordotic position, the iliotibial band aggravates the strain further. Treatment of this condition is threefold: stretching of the iliotibial band and low part of the back to establish normal mobility, resistance exercises to increase the strength of the back muscles and training in correct habits of posture.

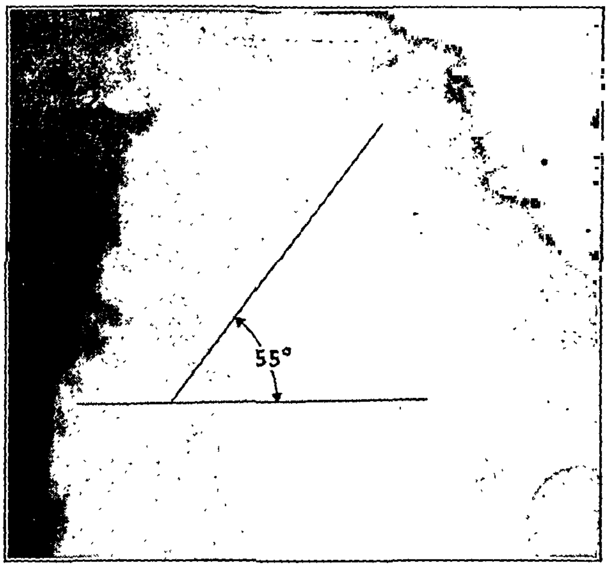

Fig. 2.—Lordosis. The lumbosacral angle is 55 degrees. The shearing stress on the muscles and ligaments has been increased by 46 per cent (from Archer, V. W.: The Osseous System: A Handbook of Roentgen Diagnosis, Chicago, The Year Book Publishers, Inc., 1945).

Acute lumbar strain or acute myofascitis usually is the result of lifting. Immobilization of an acute muscle strain allows development of fibrosis and prolongs the condition. As Bankart stated concisely, "Immobilization of acute back strain turns it into a chronic one. Immobilization of a chronic back strain perpetuates it indefinitely."[2] Therefore, treatment consists of heat and massage for analgesia and relaxation and stretching to mobilize the involved muscles as just described.

Occasionally, after a twisting motion, the patient may experience a sudden stabbing pain over the sacrum with spasm of the back muscles and inability to stand erect. Tenderness is definitely localized over one or the other posterior superior iliac spines. This is an acute sacroiliac strain, probably due to a slight dis-

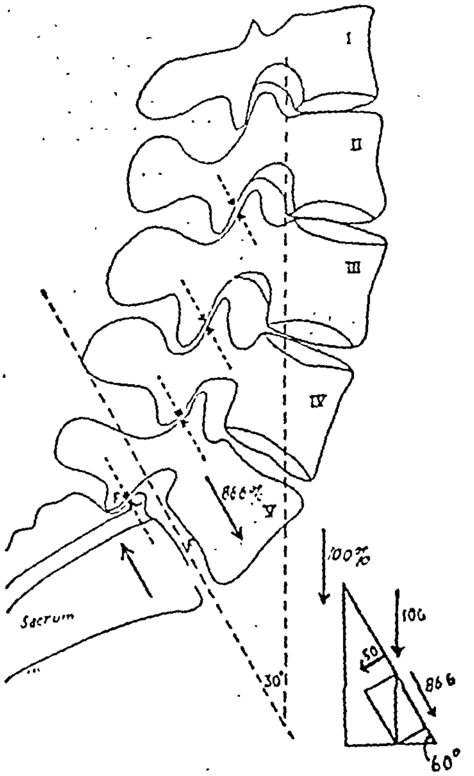

Fig. 3.—Diagram showing shearing forces acting on the muscles, ligaments and articular facets of the lumbosacral angle. When the lumbosacral angle is 30 degrees, the shearing force equals 50 per cent of the weight due to gravity. With a lumbosacral angle of 60 degrees, the shearing force is 86.6 per cent of the total weight (from Chandler, F. A.: Lesions of the Isthmus [Pars Interarticuralis] of the Laminae of the Lower Lumbar Vertebrae and Their Relation to Spondylolisthesis, Surg., Gynec. & Obst. 53: 273, 1931).

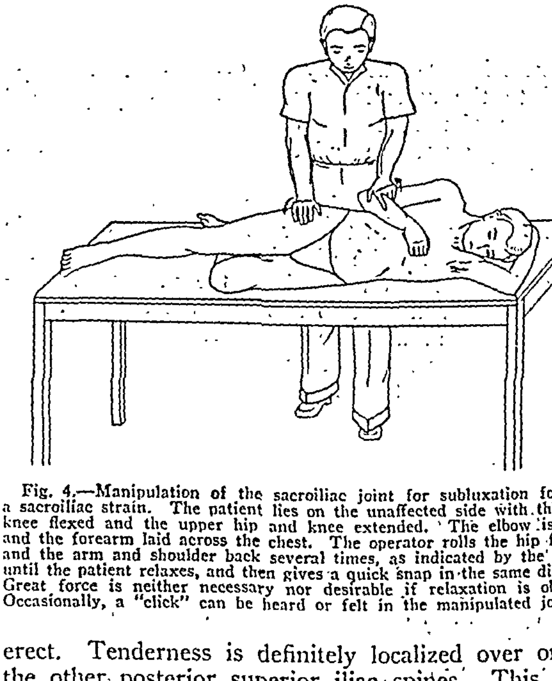

Fig. 4.—Manipulation of the sacroiliac joint for subluxation following a sacroiliac strain. The patient lies on the unaffected side with the lower knee flexed and the upper hip and knee extended. The elbow is flexed and the forearm laid across the chest. The operator rolls the hip forward and the arm and shoulder back several times, as indicated by the arrows, until the patient relaxes, and then gives a quick snap in the same direction. Great force is neither necessary nor desirable if relaxation is obtained. Occasionally, a "click" can be heard or felt in the manipulated joint.

---

[2] Bankart, A. S. B.: Low Back Pain and Sciatica, Practitioner 157: 367, 1946.

placement in the sacroiliac joint. Flexion of the hip with the knee straight, or hyperextension of the hip, causes motion and pain in the involved joint. Other motions of the hip are relatively painless. After analgesia and relaxation have been induced by heat and massage, often dramatic relief can be obtained by manipulation of the involved joint as shown in figure 4. This simple maneuver requires relaxation of the patient and then a sudden mild snap of the joint rather than the application of force. Stretching of the hip and back extensors mobilizes the muscles held in spasm to protect the sacroiliac joint.

All patients with backache should be advised concerning the type of bed to use. The modern bed with a soft innerspring mattress aggravates backaches. It is the observation of many patients with chronic backache that they can sleep better on the floor than in a soft bed. Patients with backache should be advised to sleep on a felt or hair mattress placed on bed boards without a spring. This provides the flatness and support needed to allow the muscles of the back to relax during sleep. Many patients find relief from a chronic backache merely by substituting a firm flat bed for the modern flexible bed.

PHYSICAL TREATMENT OF COMMON DISORDERS OF THE FEET

FRANCES BAKER, M.D.
San Francisco

Physical therapy should be used to accomplish a particular result. For this reason, when disorders of the feet are to be treated, a clear knowledge of the etiologic aspects of the condition is needed, and the plan of treatment should have a logical reason.

For many years there have been lists of exercises described with the general idea of strengthening the feet. In a vague sort of way, painful feet have been considered weak feet, and exercises have been prescribed to strengthen them. Needless to say, exercises can be done for only a small part of each day; yet the patient is probably forced to bear weight many hours of that day. The muscles of the feet cannot be weaker than muscles elsewhere in the body, so that there is no reason for planning strengthening exercises for the feet alone.

This paper is limited to a discussion of treatment of the common disorders of the feet. Superficially, one thinks the common disorders to be corns, calluses, bunions, traumatic arthritis, clawed toes or hammer toes, pronations and supinations. These represent the results of pressure of shoes on feet which are malalined to fit the shoes in which they have been placed, or of variations in muscular pull, due either to contractures or to spasm. The primary causes for most obvious distortions are:

I. A failure of full evolutionary development which is evidenced by variations of the first metatarsal segment or of a metatarsus varus

II. Muscular contractures of hamstrings, calf muscles or the plantar muscles and fascias which result in pes equinus or pes cavus

III. Hyperflexibility of ligaments which results in pes valgus

IV. Such congenital or developmental anomalies as pes equino varus, accessory scaphoid bones, calcaneonavicular coalitions and epiphysitis which can cause strain and variations from the normal alinement

V. Pathologic conditions which cause paralyses or arthritis and present themselves here as in other parts of the body

The diagnosis of the fundamental cause of the disorder must be made by careful clinical examination and by roentgen examination. No final program should be planned without making as complete a study as possible in order to be sure of the underlying cause.

CAUSATION, DIAGNOSIS AND TREATMENT

I. *Metatarsal Variations.*—The commonest cause of foot strain is variations from normal of the metatarsal bones because of failure of full evolutionary development. Variations in the first metatarsal segment are most often noted, since in the development of the human foot the first metatarsal came to lie beside the second to add support to the medial side of the foot. Morton [1] has defined certain anatomic variations which lead to definite strain: (1) a short first metatarsal, or (2) posteriorly placed sesamoids under the first metatarsal, and (3) hypermobility of the first metatarsal segment (including the first cuneiform, which moves with the metatarsal). This is recognized in metatarsus primus varus, where a wide angulation of 10 to 19 degrees exists between the first and second metatarsals. The strain is due to the failure of the first metatarsal to support the medial border of the foot, and excess weight is then transferred to the second and third metatarsal heads, while the sustentaculum tali becomes depressed. Where metatarsus primus varus is present, narrow or pointed shoes cause a hallux valgus.

A condition closely related to these is metatarsus varus,[2] or an inturning of the entire forefoot. This is easily recognized in babies' feet but is difficult to diagnose in adults without carefully taken roentgenograms. This type of foot is usually broad anteriorly, as is that with metatarsus primus varus, and as it is very flexible it will be fitted to a narrow shoe. As the inward deviation makes proper fitting of shoes difficult, many of the secondary disorders may be noted, such as clawing, pes cavus, or pes valgus, bunions, corns and calluses.

Treatment in the adult consists in fitting the foot with a wide shoe, frequently an E. It may be flexible enough to permit the forefoot to take its normal position, or it may be a supporting shoe with a straight inside last. No shoe is built to fit this foot. The width of the anterior part of the foot should be measured in the weight-bearing position, as the ease with which it can be compressed tends to result in fitting it with a shoe which is far too narrow. When the forefoot is properly fitted, the heel of the shoe now obtainable is far too wide; hence this has to be corrected. The heel must be low to prevent thrust on the metatarsal heads, particularly when the first is short or hypermobile. A pad of felt, rubber or leather, to lift the first metatarsal head when it is short or hypermobile, stabilizes it and takes the thrust from the second, thus stopping the formation of calluses. When metatarsus varus is present in the infant's feet, casts should be applied as early as is possible. If the condition is mild, there will be a tendency to straighten, and stretching of the

[2] Baker, F.: Foot Strain: Etiology and Treatment, Arch. Phys. Med. **28**: 218 (April) 1947.

medial border of the foot in such a way as to carry the metatarsals lateralward at the tarsometatarsal joints with stretching of soft tissues may suffice, but usually casts followed by wedging at the medial border in line with the tarsometatarsal junction are indicated, to be followed by corrective shoes to the age of 5 or 6, or during the period of the development of the bones of the feet.

II. *Shortening of Soft Tissues.*—The second commonest cause for foot strain is that of shortening of soft tissues. Where contractures of soft tissues are present, the whole alinement of the body on the feet is shifted. The gastrocnemius soleus group shows its first evidence of shortening at about the age of 7 and usually results in an inversion of the foot due to the tilting of the os calcis.

Pes cavus is congenital routinely and is accompanied with a short heel cord. It causes clawing of the toes, with consequent strain and pressure. The diagnosis of these conditions is made easily by observation, though roentgen examination should always be made to rule out bony abnormalities.

III. *Hyperflexibility of Soft Tissues.*—The third condition, hyperflexibility of soft tissues, has to be treated by fixation to allow shortening. Later shoes must hold the foot in alinement to permit the best opportunity for muscular pulls.

IV. *Congenital Anomalies.*—Congenital anomalies as compared to the etiologic factors already mentioned are rare. When they are sufficient to cause strain, orthopedic measures are usually necessary.

V. *Paralysis and Rheumatoid Arthritis.*—Paralysis and rheumatoid arthritis are dependent on the same manner of treatment as elsewhere in the body.

Treatment.—It has been emphasized that attempts at correction of the causative factors leading to the common foot disorders and the careful choosing of shoes to permit the best alinement of the feet are of first importance in the treatment of the primary variations from normal. Exercises to develop muscular power have no place in treatment of foot strain. If the general bodily musculature has been weakened by any debilitating condition, then reconditioning exercises are of importance for the muscles of the feet as they are for all muscles of the body. The idea of the relief of strain by "foot exercises" is built on a false premise.

Physical Treatment: Physical treatment is absolutely necessary for the relief of acutely painful feet. Where there has been severe strain, the pain with its accompanying muscular guarding or spasm must be controlled before more permanent management of the underlying cause can be instituted. When physical treatment is given, the patient should be in the supine position for the purpose of obtaining general relaxation. Spasm and pain are most easily controlled with large hot packs wrung as dry as possible. Whirlpool, hot bath or contrast baths are helpful. Radiant heat or diathermy may so affect the ligaments or periosteum as to increase rather than decrease the pain. After thirty to forty minutes the wet heat should be followed with very light stroking (effleurage) massage. The massage can be gradually deepened, but it must not cause pain at any time. As the foot relaxes under this treatment, slow carefully controlled movement in all directions will help to indicate whether the spasm has been released. It may be necessary to strap the foot with adhesive tape or to bandage it with an ace® bandage. If absolute rest is necessary, it should be arranged. This program should be continued until the immediate pain is controlled. Then further studies can be made as indicated and a plan for control of the disorder can be made.

Physical treatment is required for the reduction of muscular contractures. When pes cavus is noted in the baby, casts should correct the shortening in both the heel cords and the plantar tissues. If no treatment is started until childhood, then a special program of stretching should be prescribed before surgical treatment is considered. Casts may be used to start the improvement. Traction apparatus should be used. A block placed against the metatarsal heads and held by a pulley can be forced to stretch both plantar fascias and muscles and the achilles tendon. The counter traction is fixed.

About 50 or 60 pounds of force can be used over a period of thirty minutes and is a good start to a program of active stretching exercises. The best exercise for this is one in which a so-called fall-out position is assumed from a standing position. One knee is flexed and the opposite leg is extended backward so that the metatarsal heads rest on the floor. The patient then attempts to press the heel to the floor. This stretches both the plantar and gastrocnemius soleus muscles.

In most instances no other treatment is required. If this program fails, then operation is necessary, as the bones take on new shape with the constant pull of soft tissues.

Physical treatment is necessary in the mobilization of joints that have become limited in range secondary to various etiologic factors. Traumatic arthritis is frequent at the first metatarsophalangeal joint where there is faulty weight bearing as described earlier under metatarsal variations. There may be clawing hammer toes. Contractures of soft tissue may result from rheumatoid arthritis or from various types of paralysis. If pain is present, radiant heat, wet heat or paraffin may be used for twenty to thirty minutes, followed by massage and stretching. The massage can be deep stroking, kneading or friction, but it must not be painful. Mobilization of joints is essential to stop pain and to permit a normal gait. There must be free anteroposterior motion at the tibioastragaloid joint. The subastragaloid is very important, as weight of the body is distributed through it to the os calcis. Limitation here makes walking on irregular surfaces difficult, since its motion is lateralward. Stretching is done by grasping the os calcis and moving it laterally on the astragalus, which is fixed by the operator's other hand. The ligaments between the tarsal bones should be stretched. Good play should be obtained at the tarsometatarsal junction by grasping the metatarsals, stretching longitudinally and moving them laterally, and in a rotary direction. Hallux rigidus can occur if free mobility is not obtained at the first metatarsophalangeal joint. The toe is grasped and moved lateralward on the fixed metatarsal; then, with traction applied, the toe is dorsiflexed. This movement is particularly important, as the phalanx is sharply dorsiflexed on the metatarsal in normal walking. If a good range of painless movement cannot be obtained because of the arthritic changes in the joint, then surgical arthroplasty or fixation may be necessary.

Semimobile joints are routinely painful. Joints must regain their normal range or they should be fixed either surgically or by external means to prevent the strain that is constantly occurring in a joint that is only partially mobile.

Physical treatment is used to reeducate muscles to normal movement after deformities have been corrected. A short heel cord will throw a foot into pronation. When this has been relieved, shoes are fitted to hold the foot in correct position, but it is often necessary to stimulate the tibialis anticus and posticus actively to lift the medial side of the foot in walking. The peroneus tertius may also need retraining before the patient will dorsiflex his foot and reach correctly with the heel as is required in normal locomotion. Activity of the dorsiflexors of the toes must be controlled, as they are overactive when contractures have been present which prevent the normal dorsiflexion of the ankle by the tibialis anticus and peroneus tertius.

CONCLUSIONS

The proper treatment of the common disorders of the feet rests on a careful analysis of the etiologic factors. If the condition can be recognized in infancy, prevention or correction may be obtained. In the older child or adult, treatment depends on: (1) the choice of shoes to fit the patient's feet, (2) relief of severe pain, (3) obtaining complete range of motion of joints through elongation of any soft tissues that may be limited by whatever cause and (4) education to a correct gait.

PHYSICAL TREATMENT OF PERIPHERAL VASCULAR DISEASE

SEDGWICK MEAD, M.D.
St. Louis

In no other set of conditions is a proper balance between medical, surgical and physical methods of treatment more essential than in diseases of the peripheral circulatory systems. Rational therapy must be based first of all on a thorough understanding of their anatomy and physiology, both normal and morbid; secondly, on accurate methods of evaluation, and, finally, on a thorough knowledge of all methods of treatment and of judgment and discrimination in their application. One of the least satisfactory aspects is the status of tests and measurements. The most useful seem to be the simple clinical methods of inspection, palpation and auscultation. New and better ones are urgently needed.

An attempt is made in this presentation to emphasize the most widely held views of authorities in the field of vascular disease. Perhaps the best, although not very recent, review of the subject is that of Allen and Kvale.[1] Van Dellen and his co-workers should also be consulted.[2] Standard texts include the views of Abramson,[3] Homans,[4] Collens and Wilensky,[5] Allen, Barker and Hines[6] and Kramer.[7] One of the best works is by Wright.[8] Recent advances in physiology and in tests and measurements can be found in appropriate sections of the "Annual Review of Physiology"[9] and in a brief monograph by Richards.[10] A general bibliography of physical methods is available in the serial volumes of the "Yearbook of Physical Medicine."[11]

Angiologic conditions in which physical methods are inappropriate or play a minor role are omitted from the discussion.

DISEASES OF LYMPH VESSELS

Hot fomentations and elevation are standard treatment in lymphangitis and lymphadenitis of both the upper and lower extremities, whether incited by puncture wounds or by fungous infections. Luminous heat and hot tub baths may be used. Lymphedema, whether congenital (Milroy's disease) or secondary to trauma, tumor or infection, should be treated by elevation of the extremity, centripetal massage and tight bandaging. Neglect results in fibrosis (elephantiasis), which can be treated only surgically.

DISEASES OF VEINS

Stagnation of venous blood in the calves or perivesical plexus is at least one factor in the production of phlebothrombosis and phleboembolism. Once these grave conditions have developed, physical treatment is contraindicated. The simplest and most effective prophylaxis is properly carried out bed exercises. It is highly desirable that all persons treated with prolonged bed rest perform such exercises, especially in pelvic postoperative states and in cardiac decompensation. Dorsiflexion, toe fanning and curling, inversion, eversion and isometric plantar flexion against a footboard should be performed in ten to thirty repetitions, at least three times daily.

Once frank thrombophlebitis has developed the danger of embolism is regarded as past, although not necessarily in the opposite, apparently uninvolved, leg. In thrombophlebitis the leg should be elevated 15 cm. (6 in.) above the heart level. The foot of the bed may be placed on blocks. Rest is essential. Deep breathing, straining at stool and elaborate physical examination of the chest should be avoided as long as there is any hazard of embolism. Many types of heat may be used. Hot packs are probably best. Massage is contraindicated.

Thrombophlebitis migrans requires only symptomatic treatment. Care should be exercised in the use of heat on the acral parts, since this type of phlebitis is often symptomatic of underlying thromboangiitis obliterans.

In varicose elephantiasis and ulceration the underlying defect is tissue anoxia from chronically increased venous pressure. If surgical correction is not feasible, permanent external support in the form of elastic stockings or bandages is required. Localized increase of pressure over ulcers or split grafts may be achieved by binding on foam rubber sponges. Those with much experience favor pure gum rubber bandages 3 in. (8 cm.) wide and 15 feet (457 cm.) long. Acetyl-beta-methylcholine chloride (mecholyl chloride®) may be administered by ion transfer in the treatment of ulcers

to produce hyperemia, stimulate granulations and speed epithelization. Intermittent venous occlusion has been used successfully.

DISEASES OF LARGER ARTERIES

Functional diseases of the larger arteries include cervical rib and scalenus syndrome, hyperabduction syndrome of Wright[12] and costoclavicular syndrome of Falconer and Weddell.[13] Many patients in this group can be successfully treated by postural exercises alone. Others will require surgical cure. Special arrangement of pillows at night, luminous heat, head traction and massage may be required. In Wright's syndrome it is necessary only to bind the wrists loosely to the foot of the bed at night. Those doing overhead painting or lubricating may need to shift to a different job. In costoclavicular syndrome (first noticed in soldiers wearing heavy packs) the upper trapezius and levator scapulae should be strengthened by appropriate therapeutic exercises.

Structural disorders of the larger arteries include rupture of syphilitic or arteriosclerotic aneurysms, medionecrotic dissections (resulting in weird trains of neurologic and vascular symptoms), Volkmann's ischemia (initially functional), thrombosis of intimal plaques, traumatic arteriovenous shunts and gross emboli (usually from thrombi in a fibrillating left auricular appendage or infarcted ventricular wall). Many of these conditions are brusquely fatal. Thrombosis of the aorta at its bifurcation and extensive dissecting aneurysms are not incompatible with survival, although the prognosis is necessarily limited. Development of collateral channels, either via the vasa vasorum or in small external laterals, and control of local arterial spasm are crucial points in treatment.

Spasm must be treated by reactive hyperemia, either caloric (from warming unaffected extremities) or venous (intermittent occlusion), combined with ganglionic blocking agents and perhaps intra-arterial drugs. The greatest care must be exercised to maintain the occluded extremity at a temperature favorable to circulation through collaterals and yet not so high that the metabolic rate outruns the oxygen supply or that local burns occur because of poor heat dissipation in the tissues.

Advancing gangrene, including gas gangrene, may be halted in a desperate crisis by packing the unsalvageable extremity in ice while an elderly or debilitated patient can be suitably prepared by antibiotics, transfusions, insulin and the like for an amputation at leisure. Most surgeons are opposed to the use of local cold anesthesia for the amputation. If vascular disease is present in the other limbs, refrigeration should not be used, since it causes diffuse reflex vasoconstriction.

DISEASES OF SMALL ARTERIES AND ARTERIOLES

Functional diseases and syndromes of obscure causation include Raynaud's symptoms and Raynaud's disease, acrocyanosis, livedo reticularis, reflex dystrophies and atrophies, erythromelalgia (or erythermalgia) and possibly causalgia. Raynaud's symptoms are usually so mild as to require no special treatment. In Raynaud's disease the main point is avoidance of cold. Special heaters may be used for gloved hands and feet only for the prevention of attacks; the patient must be warned of the danger of burns in the use of such devices during attacks. Acetyl-beta-methylcholine chloride iontophoresis has proved useful in management, especially when there is ulceration. Sympathectomy does not cure. Traumatic vasospastic disease (miner's hand, pneumatic hammer disease) may require a change of occupation. Acrocyanosis and livedo reticularis are usually mild disorders requiring no special treatment. Exceptionally, late arteriolar proliferative changes occur similar to those seen in Raynaud's disease and pernio. Treatment of reflex or Sudeck's atrophy (secondary to trauma) is unsatisfactory. Shoulder-hand syndrome may belong to this group. Vigorous hydrotherapy, massage and therapeutic exercise should be administered for an extended period. Results are only fair. Erythromelalgia, the semiologic opposite of Raynaud's disease, requires the opposite prophylaxis—avoidance of heat. Acrodynia has some similarities.

Raynaud phenomena may occur in leukemia, rheumatoid arthritis and the "group" or diffuse collagen diseases: lupus erythematosus disseminatus, scleroderma, dermatomyositis and periarteritis nodosa. The last named, when the cause of neuritic or joint pain, may be treated by whirlpool baths. Heat should be used with caution when the cutaneous sensory nerves are affected. Insolation and ultraviolet rays should never be used in lupus erythematosus because of the danger of provoking fatal dissemination. In scleroderma localized to the hands and forearms, paraffin baths followed by vigorous massage and acetyl-beta-methylcholine chloride iontophoresis may be tried (0.1 to 1.0 per cent solution; 15 milliamperes for thirty minutes). In the generalized form of the disease no treatment is of avail. It may affect the face, mouth, esophagus and even the heart.

Structural diseases of the small arteries include most of the important groups of arterial insufficiency seen clinically. The classification by size is somewhat artificial in the case of thromboangiitis obliterans and arteriosclerosis, veins being likewise affected in the former instance and large as well as small vessels in both. Nevertheless it is insufficiency of the small vessels that eventually leads to claudication, muscle infarction and gangrene. It is here that physical agents have their greatest utility in treatment.

Included in this group are congenital and acquired neurovascular gangrene (spina bifida and medullary dysraphism, mal perforans, leprous amputations and Morvan's disease). Some of these conditions are mentioned because it is recognized that sensory denervation will not alone lead to progressive spontaneous amputations and gangrene.

Whatever the pathologic condition, the objectives in the treatment of small artery insufficiency are similar. As a preliminary step, especially in thromboangiitis obliterans, the physician should refuse to continue treatment of any patient unable finally and completely to stop smoking. Denicotinized cigarettes cannot be permitted. First steps are directed at emergency treatment for gangrene or threatened gangrene; second, the control of pain, and third, the stimulation of collateral circulation. Included in all of these are measures to interrupt all vasoconstrictor tone in the extremity.

Meticulous cleanliness and the avoidance of thermal, chemical and mechanical trauma are the first requirement. Care in the trimming of toe nails and corns and in the prevention of fungous dermatoses goes without saying. The extremity is lowered 15 cm. below the heart level. A cradle with protected carbon bulbs providing an ambient temperature of 31 to 35 C. (88 to 95 F.) will produce the right amount of vasodilatation

without dangerously raising the tissue temperature. Patented thermostatic devices are safe and effective. Even more complete relaxation of the arteriolar walls can be procured by indirect heating of one or more normal extremities. Diathermy, luminous heat, paraffin and water baths and electrically heated sleeves have been employed. In diffuse peripheral vascular disease the diathermy application may be safely made over the pelvic area. Such treatment can be used only a limited number of hours per day, because it is somewhat exhausting. Whirlpool baths may be used. Contrast baths are physiologically unsound.

Despite their somewhat shaky physiologic background, the Buerger-Allen exercises have one excellent theoretical basis: They may aid in the establishment of collaterals by tissue demands short of claudication. An analogy can be drawn with the heart. Blumgart and Schlesinger have beautifully demonstrated how anastomoses may form between various supposed end arteries, provided that occlusion takes place slowly enough. Without the stimulus of continuous activity of the heart muscle, it is doubtful that these would form. Similarly, leg muscles which are allowed to lie completely flaccid are possibly just as undesirably treated as those overused.

The patient is provided with a printed instruction sheet with diagrams of the various positions and with a time schedule individually determined for him by noting how long it takes for pallor to develop on elevation and rubor on dependency. During dependency exercises similar to those described under prophylaxis of thromboembolism are carried out. The exercises should be carried out for one hour, three times daily.

Passive exercises include suction-boot apparatus, intermittent venous occlusion and the Sanders oscillating bed. Of these, strangely enough, the one with the best background of physiologic experimentation (Herrmann, Landis and Hitzrot) has fallen into the greatest disuse. The objections to the alternating suction and pressure boot are largely practical: its effect is too transient, it is bulky and it is irritating to the skin. The intermittent venous occlusion apparatus (Collens and Wilensky), on the other hand, is small and portable, not greatly expensive, not irritating to the user and can be operated for prolonged periods of time without attention and without danger. The senile, petulant or confused patient may not tolerate it, however, any better than he does his in-lying catheter. Convincing physiologic experimentation on the effect of this apparatus is still lacking, although some apparently well carried out clinical studies have been made by its sponsors which sound convincing. Some writers feel that in order to be effective it must be used in the patient's home daily (one or two hours) for six months or more and that its predominant effect is the establishment of collaterals.

The oscillating bed is expensive. It can be used to some extent with uncooperative patients. Those experienced in its use are enthusiastic.

DISEASES OF THE SMALLEST BLOOD VESSELS

The intoxications, some affecting also the arterioles, include ergotism in its various forms, procaine-epinephrine gangrene, nicotine, certain bacterial and virus toxins, dicumarol® and a wide variety of chemicals. Some of these, such as the phenol group, depend on concentration. Others depend on idiosyncrasy. In those causing vasospasm treatment discussed previously is applicable.

Certain blood dyscrasias result in capillary embolism or thrombosis. Erythremia and sickle cell anemia are examples. Cutaneous ulcerations may be produced, especially about the shins. Similar in appearance are the ischemic ulcers sometimes seen in hypertension. After attempt at correction of the basic disturbance, treatment is symptomatic and expectant. For ulcers hydrotherapy and ion transfer of either histamine or acetyl-beta-methylcholine chloride are useful. Decubiti are ischemic ulcers produced by compression of a thin tissue between a mattress or cast and a bony prominence. Ion transfer and whirlpool treatment are also important here.

The vast group of the purpuras is not considered, since the symptom itself seldom requires treatment. Joint involvement may require heat, special supports and mild exercises. Air thrombi (bends) form in too rapid decompression of deep sea divers, caisson workers and aviators. The treatment is rapid recompression in a special chamber and then slow decompression.

Histamine reactions result in certain persons from physical agents such as mechanical trauma, cold and (rarely) heat. Sunlight may also provoke them (urticaria solaris). The only prophylaxis consists in the avoidance of the harmful temperatures. In cold urticaria, desensitization by means of daily baths, each 1 degree colder than the previous, may be attempted.

Acute and chronic pernio (chilblains) are poorly understood disorders associated with exposure to cold. I observed several instances in the winter of 1944 among Italian civilians living in unheated houses. Treatment of the ulcerated chronic type is highly unsatisfactory. Measures discussed under blood dyscrasias may be tried.

Some authorities have expressed the belief that the pathologicophysiologic aspects of frostbite and of trench or immersion foot are identical and others that they are dissimilar.[14] Until this debate is settled, the treatment of these conditions remains somewhat tentative. It is agreed, however, that in no instance should the involved part (in the acute stage) be either too rapidly warmed or kept too cold. The traditional rubbing with snow is bad on two counts: first, the use of snow or ice may extend the thermal damage already begun; second, even the lightest massage may cause breakdown and ulceration, admitting infectious agents to tissues with a severly lowered immunologic barrier. Warming the part by contact with another person is acceptable, but the use of additional heat is not to be considered. The extremity should be brought gradually to room temperature (20 to 22 C.). Walking must be avoided in the early stages. Slight elevation is desirable to reduce any edema (particularly frequent in immersion foot). No constricting clothing of any sort may be permitted about the extremity. Appropriate drug therapy will, of course, be carried out concurrently. Gangrene should be treated with extreme conservatism, allowing demarcation to occur where it will. Many apparently hopeless situations will thereby be saved. Severe paresthesias, pain and paralysis of the intrinsic musculature attest to the degree of nerve involvement. In immersion syndrome extreme hyperemia and bounding pulses are common. Elevated skin temperatures and burning pain may require cooling by an electric fan or rarely even by brief packing in insulated ice containers. This phase is succeeded by atrophy, reduced blood flow and lowered skin temperature and is treated oppositely. Stimulation by ion transfer, reflex hyperemia, alcohol ingestion and typhoid vaccine is now appropriate.

---

[14] Lange, K.; Weiner, D., and Boyd, L. J.: The Functional Pathology of Experimental Immersion Foot, Am. Heart J. 35: 238, 1948.

In the chronic stage invalidism can be needlessly prolonged by neglecting early bicycling and walking instruction. Dogged insistence on these points and on exercises for the intrinsic foot muscles will prevent the severely disabling degrees of bone atrophy and ligamentous relaxation which result from inactivity. Paresthesias are stubborn. They can be helped by hydrotherapy and massage. For the hands, suitable shop and occupational therapy should be prescribed for recovery of joint motion (especially of the phalanges), work tolerance and skill. For the feet bicycle jig saws, treadle looms and other appropriate apparatus may be used. After loss of a limb or a part, training in a new vocation may be necessary. Throughout this discussion it is assumed that patients hospitalized for weeks or months, and therefore consumed with boredom, should be provided with diversional and morale occupational therapy.

Tumors of the minute blood vessels which may be treated with physical agents include spider nevi and hereditary hemorrhagic telangiectasia (electrodesiccation) and hemangiomas of the newborn (solid carbon dioxide). In the latter one should wait for spontaneous involution, which often occurs, before intervening. Pigmented nevi, especially if enlarging, should never be treated by other than wide surgical excision.

CONCLUSION

It should be emphasized that in the physical treatment of vascular disease good judgment is more important than elaborate equipment. Ingenious improvisations, of which one saw so much during the late war, often serve well. One must avoid placing too much responsibility on the therapist, who, unless provided with a complete, thoughtful and detailed prescription, tends to fall into a routine rut. If the physician is vague about the objective of his treatment and imprecise in ordering its details, he can scarcely hope that the therapist will be any less vague in its execution. If he fails to observe that the patient has loss of pain and temperature perception, he should not blame the therapist for producing a diathermy burn. On the other hand, he cannot personally check every phase of the treatment. His only protection is to insist that the therapist be registered and a graduate of an accredited school.

ABSTRACT OF DISCUSSION

ON PAPERS BY DR. FRANCES BAKER, DR. FREDERIC J. KOTTKE, DR. ROBERT L. BENNETT AND DR. SEDGWICK MEAD

Question: What physical treatment can best be used at home in treatment for painful weak feet?

Dr. Frances Baker, San Francisco: One would want to know why the foot is painful or why it is weak. If a foot is weak it must have been held in a fixed position for a long time by some type of rigid support, or it must have ligaments that are too long. For treatment at home hot packs can be used to relieve the pain. Ice water may give more relief and will help to make the skin firm. It is important that the patient wear the shoes which have been prescribed. The patient must rest certain periods of each day. It may be necessary to refrain from weight bearing for a few days, until the acute pain subsides. Exercises are given to strengthen weak muscles and to train for the corrected position of the foot. Stretching may be necessary.

Question: What percentage of patients with flatfoot are asymptomatic?

Dr. Baker: That is a difficult question for me to answer. I have tried through various school examinations and so forth to see how many patients with flatfoot are asymptomatic. There are differen types of flatfoot. The rigid flatfoot is symptomatic and difficult to treat with any plan. Rigid flatfoot has only about 1 per cent frequency. The flexible foot is one in which the ligaments are long. It is of low incidence also. The frequent causes for flatfoot are shortened heel cord, metatarsus varus or shortened first metatarsal. The foot is always strong, if the shoe is fitted to the foot. The pronation does not cause pain unless the shoe has caused malalinement.

Question: Is the shortening of the achilles tendon the commonest cause of pronation of the feet?

Dr. Baker: I think that it is certainly a very common cause. The shortened achilles tendon can be observed after the age of 6. It is not primarily due to the wearing of high-heeled shoes. It is most commonly seen in children, beginning at about the seventh year, and from then on it will cause definite pronation. Stretching of gastrocnemius-soleus muscle and retraining of the tibialis muscle will correct it.

Question: What is the most satisfactory method for stretching calf muscles and achilles tendons?

Dr. Baker: A relatively mild contracture can be cared for by the fall-out position which I described. The patient places his hands on the wall and falls forward toward the wall, flexing the elbows while keeping the heels on the floor. For heavy stretching, when one wants to exert extra force, one may apply traction and countertraction. With pulleys, traction of 40 to 60 pounds can be continued for thirty to forty minutes. This is an excellent method for treating a patient in a department of physical medicine. Rarely do casts have to be used.

Question: What types of supports do you recommend for pronated feet?

Dr. Baker: After exercises and shoes have been prescribed, one can use felt or rubber to lift the long arch and support the shortened first metatarsal and lift the second metatarsal head. A Thomas heel with a medial lift of ⅛ to ¼ inch (0.32 to 0.64 cm.) can be prescribed.

Question: Does the use of rigid arch supports for prolonged periods weaken the muscles of the feet, so that muscle strengthening exercises are necessary?

Dr. Baker: If the foot can be placed in a shoe which is correctly alined, then the muscles frequently regain their power without specific strengthening exercises. If the support has been applied because of pronounced hypermobility, it is difficult to reduce this even with heavy resistance exercises, but these should be prescribed.

Question: How effective is the use of metatarsal bars in relieving metatarsalgia?

Dr. Baker: Metatarsal bars can be very satisfactory. One should define metatarsalgia. I suppose that pain in the region of the metatarsal heads with calluses under them is meant. If so, then the condition is treated as previously indicated. If the cause of the pain is found, one can correct the foot. There is metatarsalgia known as Morton's toe. Morton's toe is due to the formation of a neuroma on the branch of the sensory nerve between the third and fourth toes. Surgical treatment is necessary.

Question: What physical treatment should be used in conjunction with metatarsalgia?

Dr. Baker: If the foot is painful, then it is necessary to relieve the pain and regain flexibility. It may be necessary to use heat, massage and rest to relieve the spasm before flexibility can be obtained.

Question: What is the responsibility of the physiatrist in the treatment of corns, warts and calluses as causes of foot pain?

Dr. Baker: Of course, again, except for warts, these are not the cause of foot pain. They are the result. A wart should be referred to a dermatologist. It is not the business of physiatrists to treat warts. There are various types of warts, and there are too many mistakes made with regard to warts. Corns and calluses will gradually disappear if the feet are treated as previously described. If the physiatrist can be properly interested in the problem of foot pain, then he is in a particularly happy position to care for the abnormalities.

QUESTION: What can be done to relieve the pain and disability due to hypertrophic arthritis of the spine?

DR. FREDERIC KOTTKE, Minneapolis: Heat gives temporary relief from pain in osteoarthritis of the spine. Most of the patients are stiff from prolonged immobilization because of pain. Moderate stretching exercises help these patients to become more limber and at the same time reduces pain. Unfortunately, these patients require prolonged treatment and the results are palliative. Heat, massage and moderate activity will give relief.

QUESTION: Is low back pain usually due to herniated disks?

DR. KOTTKE: Low back pain has been estimated to be due to degenerated or herniated intervertebral disks in 2 per cent to 100 per cent of cases, depending on who has formed the estimate. There are two types of disk lesions. One is the classic prolapsed disk with compression of a nerve root, pain in the back radiating down the leg, sciatic tenderness and atrophy and weakness of the muscles. This may be seen in any degree of severity. The other is degeneration of the intervertebral disk without herniation and compression of a nerve root. In this lesion the pain and tenderness are localized to the back, in the immediate vicinity of the disk. There may be no roentgenographic evidence of disk injury, or the intervertebral space may appear narrowed. There is no radiation of pain into the leg. In the absence of objective observations a diagnosis of a degenerated disk is presumptive and remains to be proved. Chronic backaches which are placed in this category frequently respond to treatment that would not logically be prescribed for a degenerated disk. Therefore, further proof is needed that this type of backache is due to a degenerated disk. I think, as a conservative estimate, that 10 to 20 per cent of low back pain may be related to herniation or degeneration of the intervertebral disks.

QUESTION: Is there any value in applying plaster casts or adhesives to the back in acute lumbar strain?

DR. KOTTKE: When a patient has such acute back pain that he will not tolerate any activity, heat and gentle massage may be used. If the pain is exquisite, and he will not allow manipulation of any sort, immobilization by strapping for a few days allows the acute pain to subside. The patient will allow one then to begin mobilizing activity. Such cases respond well to strapping. There is a larger number of cases in which it is not necessary for one to wait before beginning mobilization after heat analgesia. One may begin immediately with mild activity and in that way gain a few days in the treatment of the patient.

QUESTION: What is the relationship of the fibrositic nodule to the cause of back pain?

DR. KOTTKE: In some cases of low back pain one can find nodules that would be classified as fibrositic nodules. In some of these cases, there is no question that this so-called fibrositic nodule is actually a herniation of fat tissue through the lumbodorsal fascia. Copeman has shown in a careful study that these tender fibrositic nodules frequently are located where fat is distributed beneath the lumbodorsal fascia and in some cases it has been possible to find fat nodules herniated through the fascia and remove them surgically. Relief has been obtained by the excision of the fat nodule in these cases. Sometimes one obtains relief by injecting procaine hydrochloride into the areas of the nodule. In a certain proportion of cases, fibrotic nodules undoubtedly cause low back pain.

QUESTION: How many weeks or months should physical therapy be continued in poliomyelitis?

DR. ROBERT BENNETT, Warm Springs, Ga.: To answer that completely, one would have to write a book. It depends on the amount of involvement and the age of the patient. Anyone who has treated poliomyelitis extensively realizes that there is a great difference between the treatment of the adult patient and the treatment of the child. In the child, there must be some type of physical therapy for ten or fifteen years. One might best say that within six months the anatomic pattern of neuromuscular units is left; by the end of six months the inflammation in the nervous system has quieted down and there are available certain anatomic units. However, it might go on for years. I think that it is foolish to say that one should continue physical therapy for six months or eighteen months or any number of years. It depends on the patient. Many patients who have practically normal recovery of muscle function have residual tightness in the band and back or in the heel, which, if not stretched routinely, continuously for years, particularly in children until full growth has been established, causes trouble. With respect to how long muscle reeducation should go on, here again the child differs from the adult. In the adult, I would say moderate and specific muscle reeducation should be continued from fourteen to eighteen months. In the child who is learning habit patterns, muscle gait training should go on for years.

QUESTION: Should hot packs be used routinely in all cases of early poliomyelitis?

DR. BENNETT: Nothing should be used routinely in poliomyelitis. Hot packs have a definite purpose. They are part of a treatment to help relieve pain and release tightness.

QUESTION: How long should hot packs be used?

DR. BENNETT: Hot packs should be used until their usefulness in relieving pain and releasing tightness as part of the treatment is gone. If hot packs are needed to help relieve pain and release tightness, one should use them. There are other aspects of treatment that are controversial, for example, the use of curare as an adjunct in relation to muscle stretching. There is little doubt that the intelligent use of curare is indicated in some cases. I have used little of it because I have not found it necessary. By means of a number of other instruments and agents, I can achieve the same result in releasing spasm and tightness and reestablishing mobility. In certain selected cases and in skilled hands, curare can be an aid.

QUESTION: Can one diagnose acute poliomyelitis by electromyographic observations?

DR. BENNETT: I do not believe in the present status of knowledge that one can diagnose any disease entirely by electromyographic observations.

QUESTION: Is there any clinical and physiologic improvement following intermittent occlusion? What is the value of intermittent application of positive or negative pressure or both in the management of so-called varicose ulcers?

DR. SEDGWICK MEAD, St. Louis: The primary defect in varicose ulcers is increased venous pressure. If that cannot be cured by surgical means, then some type of method of increasing the tissue pressure above the venous pressure must be resorted to. It is difficult to see how intermittent venous occlusion could accomplish that except in a transitory way. Nevertheless, there are some clinical reports of rather remarkable healing of varicose ulcers with the use of intermittent venous occlusion. With respect to anticoagulants, their use in a patient who one suspects has a thrombus floating in the venous stream which may be ready to break off at any moment, it is agreed by all that anticoagulants will not dissolve the thrombus. Any type of active exercises used after the introduction of anticoagulant therapy must be begun with definite reservations about time. No one is agreed yet just how long it is safe to wait before such active exercises are begun. In general it is thought that when active symptoms are present, such as swelling and pain, sufficient organization of the thrombus to the vein wall has occurred so that embolism is no longer probable. There is a question here about peripheral vascular disease in diabetes. In general, what was said about arterial disease is applicable here, and, of course, it depends on how severe the disease is. There are two additional complicating factors in diabetes. Often a type of neuritic pain, which is poorly understood, may result from neuropathy in the spinal cord rather than in the peripheral nerves. The patient may have, in addition to that, loss of vibratory and position sense and perhaps a peripheral distribution of loss of sense of pain and temperature, which may complicate his treatment considerably. It may lead to burns if great care is not exercised.

QUESTION: Why are "contrast baths" physiologically unsound in peripheral vascular disease?

DR. MEAD: I know of no good physiologic work on that point. Nevertheless, the consensus seems to be that following contrast baths the skin temperature is lowered. It is assumed, therefore, that there is a concurrent vascular constriction. Authorities are nearly unanimous in their condemnation of contrast baths in the treatment of occlusive arterial disease.

SELECTION OF THERAPY FOR INDIVIDUAL PATIENTS WITH THYROTOXICOSIS

ROBERT H. WILLIAMS, M.D.
Seattle

The obscurity of the causation of thyrotoxicosis and the lack of completely satisfactory results with any type of therapy that has been prescribed for it have promoted continuous investigations, involving many different approaches. Some of the many types of treatment that have been, or are being, investigated are listed in table 1. The rationale of these therapies is based on the hypothesis that the central nervous system plays an important role in regulating the production and release of thyrotropin, which, in turn, governs the production of thyroid hormone; since too much of the latter causes thyrotoxicosis, anything, no matter where its action is centered, which tends to decrease the production of the thyroid hormone or antagonize its action will cause a remissioin in thyrotoxicosis.

During approximately the last five years I have investigated various of these types of therapy in 441 patients with thyrotoxicosis. Some of the specific compounds tested are listed in table 2. I also have observed the validity of using some of these compounds in conjunction with iodine, thyroidectomy and radioiodine. However, in this paper I am comparing chiefly the results obtained in the treatment of thyrotoxicosis (*a*) by means of subtotal thyroidectomy, (*b*) with prolonged administration of thiouracil[1] and (*c*) with radioiodine. In comparing these forms of therapy, I am utilizing chiefly my own experience, since an opportunity was afforded for studying, firsthand, a cross section of patients of the same general type under similar environment. Moreover, advantage was taken of the opportunity of comparing several types of therapy in the same subject. Finally, earnest efforts were made to follow the progress of the patients, not only during, but after the completion of, the treatment. Advantage in this respect was afforded by the fact that most of the patients lived in or close to Boston and could readily be given appointments for repeated examinations. The least cooperative ones were usually induced to return for examination following visits to their homes by social service workers or by me. However, 26 of the 441 patients disappeared from prolonged observation. The total number of patients who received the three major types of therapy are listed in table 3.

In addition to these major groups, there is a miscellaneous group of patients. They do not represent subjects that have fallen out of the three main classes; such patients are discussed under their respective headings. Instead, this miscellaneous group consists chiefly either of patients who have recently begun treatment or of those who served for clinical bioassay purposes.[2]

RESULTS OF THERAPY

Subtotal Thyroidectomy.—The preoperative and postoperative care given in this clinic and the courses of the patients during these intervals have been described previously,[3] along with some of the follow-up results. It is important to emphasize that most of the thyroidectomies were performed in three different hospitals and by four different surgeons whose main surgical specialty was in the thyroid field. The results obtained in 195 patients, almost all of whom were subjected to thyroidectomy previous to two years ago, are shown in table 4. The 2 deaths were previously described[4]; each occurred within twenty-four hours after thyroidectomy. One death was due to pulmonary embolism (?) and the other to hyperthyroidism.

TABLE 1.—*Types of Therapy in Use for Thyrotoxicosis*

General Basis for Therapy	Specific Therapy
A. Decreased neurogenic stimulation of thyrotropin production	A. Psychotherapy
B. Decreased capacity for thyrotropin production	B. Irradiation of pituitary
C. Inactivation of thyrotropin	C. Iodine
D. Decreased capacity for thyroxin production	D.
1. Decreased thyroid size	1. Thyroidectomy Irradiation { Roentgen Radioiodine
2. Biochemical antagonism	2. Thiourea derivatives Aminobenzenes Thiocyanates
E. Antagonism of thyroxin	E. Thyroxin homologues Paraxanthine

Prolonged Treatment with Thiouracils.—A total of 119 patients[5] were treated for relatively long intervals with thiouracils. Propylthiouracil alone was used for 8 patients and thiouracil was used, alone or with propylthiouracil, in the others. The characteristics of most of the conditions treated, the program of therapy and the early results have been described previously.[6] The same general plan of therapy was used with propylthiouracil as with thiouracil. It was the policy to treat most of the patients for ten to twelve months before discontinuing therapy. A few patients were treated continuously for as long as eighteen months. Thirty-five patients were treated for a total of more than one year and 13 for more than two years.

The patients treated for prolonged intervals do not represent a selected group except so far as 10 patients were eliminated because of the large size of the thyroid gland and a few were eliminated because of the toxic reactions to the compounds. The experiences of my associates and me with toxic reactions to thiouracil

---

Read before the Section on Internal Medicine at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 23, 1948.

From the Thorndike Memorial Laboratory, Second and Fourth Medical Services (Harvard), Boston City Hospital, and the Department of Medicine, Harvard Medical School, Boston.

[1] Throughout this paper the word "thiouracil," unless otherwise clarified, is used to include not only thiouracil but also its derivatives. However, in most instances when it is used in this general way, it refers to thiouracil itself and/or propylthiouracil.

[4] Williams.[2] Williams and Clute.[3]

[5] Four patients covered in a previous report (Evaluation of Newer Methods of Treatment of Thyrotoxicosis, *West. J. Surg.* **56:** 72-76 [Feb.] 1948) are not included here because they were used for the bioassay of several thiouracils and received insufficient dosage.

[6] Williams, R. H.: Thiouracil Treatment of Thyrotoxicosis. I. The Results of Prolonged Treatment, J. Clin. Endrocrinol. **6:** 1-22 (Jan.) 1946.

have been reported previously.[7] In using propylthiouracil for intervals of a few weeks in 205 patients, we encountered significant toxic reactions in only 2 subjects, fever in one and fever with leukopenia in the other.

Of the 119 patients, 57 had a remission which has been sustained after cessation of treatment for a relatively long period, as indicated in table 5. These patients are all well now. Five of the 57 persons were men; 4 of the 57 had nodular goiters. Factors which tended to favor remissions were female sex, small goiter, mild thyrotoxicosis and age above 30 years.

Patients treated for intervals of from eight to fifteen months were more prone to have sustained remissions than were those treated for only a few months. A few patients who had a relapse when treatment was stopped experienced a sustained remission after another ten month course of therapy was given. That some patients tend to be refractory to this type of therapy, even after long intervals, is indicated by the fact that of 13 persons treated for more than two years only 1 had a sustained remission after cessation of therapy. The longer the subjects have remained in a state of euthyroidism without therapy the greater are their chances of remaining in this condition. Although 5 patients had a reappearance of thyrotoxicity after remaining free of it for as long as one year,[8] none has had a relapse after remaining well for more than two years without treatment.

TABLE 2.—*Specific Compounds Used in Treatment of Thyrotoxicosis*

- Thioureas
  - Thiourea
  - Diethylthiourea
  - Tetramethylthiourea
  - Orthophenylene thiourea
- Miscellaneous
  - Diethyl thiobarbituric acid
  - "Thiobarbital"
  - Aminothiazole
  - *p*-aminobenzoic acid
- Iodinated Compounds
  - 5-iodothiouracil
  - 5-iodo-6-methylthiouracil
  - 3, 5-diiodo-*p*-aminobenzoic acid
  - Ethyl di-iodobrassidate
- Thiopyrimidines
  - Thiouracils
    - Thiouracil
    - 6-methylthiouracil
    - 6-propylthiouracil
    - 6-cyclopropylthiouracil
    - 6-butylthiouracil
    - 6-isobutylthiouracil
  - Thiothymine
  - Thiocytosine
- Thyroxin Antagonists
  - Paraxanthine

TABLE 3.—*Patients Treated for Thyrotoxicosis with the Three Major Types of Therapy*

Type of Treatment	No. of Patients
Thiourea compounds or aminobenzenes	441
Thiouracils for prolonged intervals	119
Radioiodine	106
Thiourea compounds and thyroidectomy	195

Of the 57 patients who have remained in remission, there are only 5 in whom at present the thyroid gland is not smaller than it was at the beginning of the thiouracil treatment. The maximal increase in size of the gland in the 5 patients was 10 Gm. (table 6). In 6 patients the decrease in size of the gland was aided by roentgen therapy. However, even without this treatment in several persons, glands which were estimated to weigh from 40 to 60 Gm. decreased to about 20 Gm.[9]

Most of the 62 patients who did not experience sustained remissions were treated effectively by other measures, as indicated in table 7. There was less tendency for a decrease in the size of the thyroid gland in the 62 patients who did not experience a sustained remission to prolonged treatment than in the ones who did. Indeed, in a few patients experiencing relapse the gland became much larger. There has been nothing to suggest malignant growth in either group.

TABLE 4.—*Results of Subtotal Thyroidectomy in 195 Patients* *

Persistent or recurrent thyrotoxicity	15
Myxedema	4
Hypoparathyroidism	2
Paralysis of vocal cords	2
Death	2

* Each patient had thiouracil alone or with iodide before operation.

Remission after radioiodine	28
Remission after thyroidectomy	22
Disappeared from observation	9
Receiving treatment now	3

Radioiodine.—Radioiodine was used in this clinic in the treatment of 106 patients with thyrotoxicosis. Six were treated only in the last three months and the results cannot be evaluated at present. Of the remaining 100, 21 had had a subtotal thyroidectomy and 40 had had thiouracil for more than eight months, although not in adequate doses in some cases. I^{131} was used in 97 patients and I^{130} in 3. The last 3 have been well for more than two years. Of the other 97 patients, only 5 have persistence of thyrotoxicity; 92 have been in remission for more than one month and 80 have had no reappearance of their disease during a period of more than four months. Myxedema developed in 3 patients and transient hypothyroidism in 13. A few subjects experienced a transient exacerbation in thyrotoxicity following radioiodine. In most of the 78 subjects with diffuse enlargement of the thyroid, the gland decreased to an essentially normal size. Each of 22 patients with toxic nodular goiter had a decrease in the size of the thyroid, but in a few subjects significant enlargement persisted in spite of large doses of radioiodine.

---

[7] Williams, R. H.; Clute, H. M.; Anglem, T. J., and Kenney, F. R.: Thiouracil Treatment of Thyrotoxicosis: II. Toxic Reactions, J. Clin. Endocrinol. 6: 23-51 (Jan.) 1946.

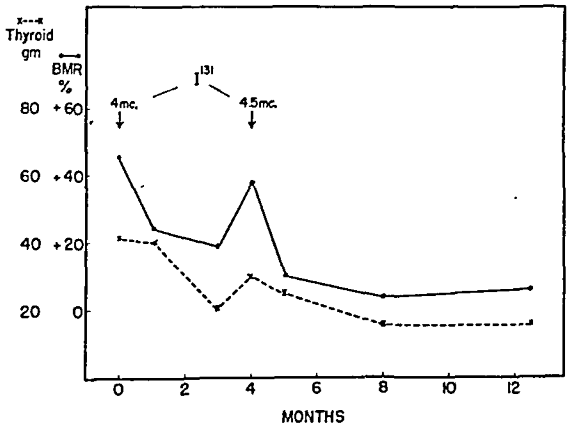
[8] In the patients reported on in January 1946,[6] the following results were obtained: Of the 49 patients who had had no relapse at that time, 10 have subsequently had a relapse. In 5 patients the relapse occurred within eight months after cessation of treatment; in 4 it occurred between twelve and eighteen months, and in 1 at twenty-four months. Of the 51 patients constituting the "relapse group," 14 had an additional course of thiouracil; 7 of these have remained well for more than two years after cessation of therapy.

[9] The size of the gland was estimated in grams on each visit of the patient. I am of the impression that in most patients with glands less than 60 Gm. in weight satisfactory estimations can be made.

In a few patients as many as five doses of the isotope were given before a remission was obtained. What was considered as probably a minimal effective dosage was administered, and then after an interval of approximately two months, if a remission had not occurred, another dose was given. This plan was followed until the desired results had been obtained. The total dosage of I^{131} used before a sustained remission was produced varied from 2 to 36 millicuries. Isotope counts over the thyroid and in urine and blood and palpation of the thyroid gland, especially with reference to size and nodularity, have all been compared with the dosage of radioiodine ultimately used in the production of a remission in the hope that a method could be evolved for a more accurate determination of the amount of isotope required. However, none of these procedures has proved satisfactory. Palpation of the gland has been of more help than the other criteria. No significant effects of the radioiodine on nonthyroid tissue have been observed.

REPORTS OF CASES

B., a housewife, aged 58, had had thyrotoxicosis for ten years. She had a persistence of her disease in spite of a subtotal thyroidectomy and of roentgen therapy. She reacted to tetramethylthiourea with fever and to propylthiouracil with fever and leukopenia. She failed to respond to iodide therapy, and she refused to have another thyroidectomy. Within ten weeks, after 4 millicuries of I^{131}, her basal metabolic rate had decreased from + 30 to — 24 per cent and the thyroid gland decreased from 30 to 20 Gm. Within 3.5 months after radioiodine her metabolic rate was + 3 per cent; she has remained in a euthyroid state for the subsequent two months.



Graph showing weight of thyroid gland and basal metabolic rate of patient D, as affected by administration of radioactive iodine.

D., a clerk, aged 53, failed to maintain a remission of his thyrotoxicosis on cessation of thiouracil treatment, having had this treatment for six months. Following 4 millicuries of I^{131}, he experienced a decrease in his thyrotoxicity and in the size of his thyroid gland, but within four months the gland had become larger and the metabolic rate had increased (chart). Following an additional 4.5 millicuries, the gland became smaller than normal and a state of euthyroidism has now existed for twelve months.

Scarred neck	3	2	1
Large nodular goiter	1	2	3
Large diffuse goiter	1	1	2
Expense	3	2	1
Regulation of therapy	2	2	1
Time lost from work	3	1	2

COMMENT

The data presented show that good results can be obtained with each of the three main types of therapy, although each has certain disadvantages. The problems, nonthyroidal as well as thyroidal, presented by a large group of thyrotoxic subjects may vary considerably and the type of therapy selected should take these problems into consideration. Some of the factors deserving attention in the selection of therapy are presented in table 8. Circumstances which are of little concern in certain cases demand serious consideration in others. Since there is great variation in the number and significance of these factors, as well as others, one is handicapped in making generalizations, but a few of these may be stated.

Radioiodine.—This form of treatment is favored by most of the patients because it is, to them, the simplest therapy. It is relatively inexpensive and is not associated with significant physical or emotional discomfort. It contracts the diffuse goiters to an essentially normal size, and in the majority of cases a remission of hyperthyroidism can be produced within six months. It has not caused death, hypoparathyroidism or paralysis of the vocal cords. It can be used in a few cases in which treatment with thiouracils or thyroidectomy would be associated with serious risk. It causes partial contraction of nodular goiters, but a point may be reached where, although the gland is still enlarged, it will not contract further. Such goiters tend to have many cysts, much fibrous tissue and numerous calcium deposits; radioiodine would not be expected to affect this type of tissue significantly.

The main drawback of this type of treatment is the difficulty involved in selecting the appropriate dosage, errors in which may either cause myxedema or permit the thyrotoxicity to persist. Errors of underdosage are less important than those of overdosage, since the former can be corrected by subsequent therapy. No significant nonthyroidal toxic reactions have been encountered. Much has been written, particularly in the lay press, about its carcinogenic powers. However, it remains to be determined whether, in the doses that I have used, it has a significant carcinogenic effect.

Radioiodine is distinctly less available throughout the country than are the other forms of therapy and, in the light of present information, it should remain so. Extensive use of it could pose a number of public health considerations. Moreover, the selection of appropriate dosage is more difficult than is the case with thiouracils.

Radioiodine is convenient for use in patients who have had prolonged treatment with one of the thiouracils but have failed to maintain a remission on cessation of treatment. Such patients have usually built up a strong hope that they will not have to have a thyroidectomy and are well pleased to learn that the isotope can be used instead.

Thiouracils.—One of the thiouracils, of which the propyl derivative is the one commonly used at present, can be employed wisely in some cases. Its general availability is of distinct advantage; high grade surgical treatment of the thyroid and radioiodine are available to only a relatively small proportion of patients. The ability to regulate the dosage is of distinct importance, especially in patients with psychobiologic disintegration and in those with pituitarigenic ophthalmopathy. Treatment with thiouracil is relatively simple and inexpensive and is not associated with paralysis of vocal cords, hypoparathyroidism or permanent myxedema. Although most of the patients treated with it for prolonged intervals experience a decrease in the size of the goiter, the limited extent of the decrease is such as to warrant consideration of the other types of therapy when large goiters are present, especially nodular ones. It is difficult to predict in a given case whether a course of thiouracil therapy will be followed by a sustained remission. However, the chances are sufficiently good in female patients over 30, with small goiters and slight thyrotoxicosis, to warrant a trial with propylthiouracil. The long duration of the therapy and the uncertainty of the results are of distinct concern to some patients. Moreover, it should be of concern to the physician when he observes that it is producing in the patient an attitude of chronic invalidism. Thiouracil therapy can be used effectively in patients who have had or may be likely to have complications from thyroidectomy.

Subtotal Thyroidectomy.—This method of therapy has an advantage over the other types in that it has become highly developed and the immediate and long range results from it have been well established. It produces a quicker sustained remission, and it actually removes the goiter. The remissions from this type of treatment may be more permanent than those following thiouracil treatment. It is of particular advantage in patients with large nodular goiters, especially when pressure symptoms are present. It is also indicated in patients with questionable carcinoma of the thyroid. It is associated in a few cases with hypoparathyroidism, paralysis of the vocal cords and, occasionally, death. It, like the other types of treatment, may be followed by a reappearance of the thyrotoxicosis. It involves more emotional and physical upset, necessitates hospitalization and is more expensive. One of its main drawbacks is that most persons just do not like to be operated on when satisfactory results can be obtained by other methods.

SUMMARY

Of the many treatments for thyrotoxicosis that have been employed, the only ones that can be used satisfactorily are thiouracils, radioiodine and thyroidectomy. Since good results can be obtained with each of these treatments, many aspects should be considered in selecting the appropriate type of therapy for a specific patient.

Subtotal thyroidectomy is the treatment of choice when a large nodular gland is present or when a rapid recovery is one of the main objectives.

At least one long course of propylthiouracil, or an allied compound, is indicated in female patients more than 30 years of age with mild thyrotoxicosis and a small goiter. It is also the treatment of choice in patients with certain psychic problems. It can be used advantageously in patients who have had one or more subtotal thyroidectomies and in others who might constitute surgical risks. It is valuable in cases in which radioiodine or good surgical therapy is not available.

Although radioiodine can be used in any patient with thyrotoxicosis, it is particularly useful in those who have had toxic reactions to thiouracils, and in those who are not good surgical risks or who have previously had one or more thyroidectomies.

ABSTRACT OF DISCUSSION

DR. SAUL HERTZ, Boston: The excellent presentation which Dr. Williams has given us has indicated that, except for the bottleneck of availability of the isotope, therapy with radioiodine, which my colleagues and I have used successfully now for nearly seven years, would likely replace the other forms of therapy for diffuse toxic goiter. The treatment of the nodular goiter with thyrotoxicosis is still a surgical problem. Treatment with radioactive iodine has been so successful in our hands, and also in the hands of many others who have tried it (it is being investigated in about twenty different institutions at present), that we have come to the conclusion that even though the nodular goiter must eventually be operated on, the use of radioactive iodine as a method of preoperative preparation of these patients is still practical. The availability of propylthiouracil has placed in the hands of the general practitioner a potent and effective drug for the treatment and control of hyperthyroidism; however, this form of treatment requires a prolonged period of close observation. If the patient is sufficiently under control by the physician—and in most instances that is so—it is perfectly permissible to start the patient on that form of therapy. However, it should be clearly understood that this therapy offers nowhere near 100 per cent possibility of a cure. It must be made clear to the patient that even though control of the disease may be present for six months, it is required that he be under surveillance for perhaps as long as two years, to make certain that he is cured. Any other form of therapy for thyrotoxicosis also includes a follow-up period of that length, so that the main advantage of propylthiouracil is its great availability. Radioiodine now has become safe and readily usable in properly qualified hands. The amount of radioiodine which is available in the world for other purposes at present is tremendous. We have sufficient in America to cure all the toxic goiters for the next ten centuries. Although radioactive iodine is nearly specific for the condition, there may come a time when we will have a corrective of the metabolic and hormonal unbalance which occurs in a patient with hyperthyroidism sufficient to warrant giving up all the other forms of therapy in favor of its use. By a combination of the studies of the results obtainable from surgical therapy, the use of the antithyroid drugs and radioactive iodine, both as a tracer and as a therapeutic agent, we have great promise of discovering the physiologic and final method for the treatment of the disease. Radioactive iodine has been effective in a large number of cases of toxic goiter after all other methods failed. It is the method of choice in the complicated cases wherever it is available.

Dr. Willard O. Thompson, Chicago: It seems to me that this paper by Dr. Williams and the discussion by Dr. Hertz well illustrate the advance in the last few years in the treatment of toxic goiter. Just a short time ago, we thought treatment was pretty well perfected. Operative mortality had been reduced in leading clinics to about 1 per cent. Then along came radioactive iodine and the antithyroid drugs, and everything that had been written on the treatment of toxic goiter up to about three years ago is now completely out of date. With the use of antithyroid drugs, it is possible to control thyrotoxicosis completely before the patient comes to operation. As a result, the risk of operation is no greater than in a patient without thyrotoxicosis. As a result of the introduction of these drugs, operative mortality has dropped from 1 per cent to about 0.1 per cent in leading clinics. In other words, it has dropped almost to the vanishing point. As a general principle for the treatment of toxic goiter on a large scale, the best method at present is probably subtotal thyroidectomy after adequate preoperative preparation with propylthiouracil and iodine. Fortunately, it is possible to individualize the treatment of the patient, and, therefore, it is best not to adhere rigidly to any general rule but to treat each patient as an individual problem. It seems to be agreed that antithyroid drugs or radioactive iodine should be used as the sole method of treatment in patients who for some reason or other present a poor operative risk. They seem to represent the treatment of choice in patients who have persistence or recurrence of the disease following subtotal thyroidectomy. The experience of most observers indicates that when antithyroid drugs are used for medical management without operative intervention, the disease may be permanently controlled in about 60 per cent of the patients. This percentage is too low to warrant their use for routine medical management. They represent an important advance, but I do not believe that any antithyroid drug has yet been developed which produces a cure in a sufficiently large percentage of patients without toxic reactions to warrant the statement that the medical management of the disease with antithyroid drugs has arrived. As far as radioactive iodine is concerned, the results appear to be promising. This may prove to be the method of choice in the treatment of exophthalmic goiter. Probably we should reserve judgment for a few years until we see just what the status of this therapeutic agent is, that is, whether there are any untoward late complications. A few years ago my associates and I irradiated the pituitary in a small series of patients with exophthalmic goiter and cured about a third of them with that method. This percentage of cures is, of course, altogether too small, but the results are interesting from the standpoint of the mechanism involved in the disease.

Dr. Cecil J. Watson, Minneapolis: Would Dr. Williams comment on the question of possible increase in incidence of carcinoma of the thyroid five, ten or fifteen years hence in persons who have received radioactive iodine (I^{131})?

Dr. Williams: I should like to reemphasize the fact that there is a place for each of the three methods of therapy for thyrotoxicosis. In selecting the type of treatment to prescribe, one should consider not only the many specific problems of the patient, but also the quality of therapy available in the subject's community. The latter aspect is of especial concern in recommending thyroidectomy or radioiodine. On the other hand, propylthiouracil is available for use in any community. I am of the impression that following appropriate treatment with this compound for one to one and a half years a sustained remission will occur in approximately 70 per cent of female patients over 30 years of age, with mild thyrotoxicosis and only slight enlargement of the thyroid gland. In the cases in which propylthiouracil therapy is unsuccessful, thyroidectomy or radioactive iodine may still be prescribed. In reply to Dr. Watson's question concerning the carcinogenic effect of radioiodine, the significance of this complication remains to be determined. However, I am of the impression that the possibility should not be regarded as a strong contraindication of therapy, on considering the amount of activity in the doses of radioiodine that we used, and the fact that the greatest concentration of isotope occurs in the thyroid gland, an infrequent site for highly malignant neoplasms.

Special Article

PRIMER ON THE RHEUMATIC DISEASES

PREPARED BY A COMMITTEE OF THE AMERICAN RHEUMATISM ASSOCIATION

INTRODUCTION

This is the third edition of the Primer. The first was published by the American Committee for the Control of Rheumatism in 1934 in cooperation with the Committee on Scientific Exhibit of the American Medical Association. A second edition, devoted only to arthritis, was published in 1942 by a committee of the American Rheumatism Association, the latter organization having meanwhile succeeded the American Committee for the Control of Rheumatism. Now advances in knowledge of the rheumatic diseases necessitate this third edition, which is brought out at this time especially in connection with the Seventh International Congress on Rheumatic Diseases to be held in New York City from May 30 to June 3, 1949.

SCOPE OF THE PRIMER

This edition is concerned with the rheumatic diseases in general. As in the case of the previous Primers, its purpose is to present its subject matter as simply and briefly as is consistent with adequate coverage and to present it from the point of view of the general physician rather than that of the specialist.

The term "rheumatism" as employed here includes that large and rather miscellaneous group of diseases and disorders of the supporting tissues which are of concern to the American Rheumatism Association: namely, rheumatic fever, the various forms of arthritis and the large group of less clearly defined disorders such as fibrositis, myositis, bursitis, neuritis and neuralgia. It is not intended to include the structural defects of the bones and joints which are the primary concern of the orthopedic surgeon, although many of these are listed in the classification for the sake of completeness.

Because of the condensed nature of this Primer it has not seemed advisable to give individual references to specific articles in the medical literature. However, a number of general references are cited in the bibliography and the reader is referred particularly to the Review of American and English Literature which appears each year in the *Annals of Internal Medicine* under the editorship of a committee of the American Rheumatism Association.

INCIDENCE OF RHEUMATIC DISEASES

In 1938 the United States Public Health Service reported a survey of the calculated incidence of a large number of diseases in the United States. The results, which are summarized in table 1, revealed that the rheumatic diseases are the most common cause of chronic illness and that they disable each year ten times as many persons as diabetes and tuberculosis, seven times as many as cancer and twice as many as heart diseases. Furthermore, the rheumatic diseases enumerated in the survey included arthritis, gout, neuralgias,

This article has been abbreviated in The Journal by omission of the bibliographical references. These may be found in the authors' reprints.

The Committee of the American Rheumatism Association consists of Dr. Currier McEwen, New York, Chairman; Drs. Joseph J. Bunim, Richard H. Freyberg, Edward F. Hartung and Charles Ragan, New York; Dr. John H. Talbott, Buffalo, and Dr. Hans Waine, Boston.

neuritis, lumbago and the like, but did not include rheumatic heart diseases. Hence, if corrected for the latter, the incidence would have been found even higher.

In respect to days lost from work, the rheumatic diseases were surpassed only by nervous and mental diseases, as shown in table 2. The estimated cost of medical care alone for the patients exceeds $100,000,000 annually, but to this sum there must be added an inestimable amount due to losses in production and education occasioned by disability among workers and students. These indications of the enormous economic loss resulting from rheumatism are borne out by data from other countries. In England, for example, it has been estimated that rheumatism causes one sixth of the total industrial disability, and one sixteenth of all funds paid out by that country for pensionable invalidity is for the rheumatic diseases.

Table 1.—*Estimated Prevalence of Specified Chronic Diseases in the United States (1937)*

Disease	Number of Cases
Rheumatism	6,850,000
Heart disease	3,700,000
Arteriosclerosis and high blood pressure	3,700,000
Hay fever and asthma	3,450,000
Hernia	2,100,000
Hemorrhoids	2,000,000
Varicose veins	1,750,000
Chronic bronchitis	1,700,000
Nephritis and other kidney diseases	1,550,000
Nervous and mental diseases	1,450,000
Goiter and other thyroid diseases	1,200,000
Sinusitis	1,150,000
Cancer and other tumors	930,000
Diseases of female organs	720,000
Tuberculosis, all forms	680,000
Diabetes mellitus	660,000
Diseases of gallbladder and liver	640,000
Other diseases of the circulatory system	440,000
Chronic tonsillitis and other throat disorders	380,000
Ulcers of stomach and duodenum	330,000
Diseases of bladder and urethra	270,000
Chronic diseases of the skin	270,000
Anemia	240,000
Chronic appendicitis	170,000
Chronic diseases of the eye	150,000
Chronic diseases of the ear	100,000
Chronic pleurisy	90,000
Diseases of the prostate and male genitourinary organs	80,000

From The National Health Survey, Bulletin 6, Sickness and Medical Care Series, United States Treasury Department, Public Health Service, 1938.

It must be emphasized that the rheumatic diseases in tables 1 and 2 include far more than the definite arthritides and that figures of the magnitude shown are reached because of the inclusion of fibrositis, bursitis and other nonarticular forms of rheumatism. Unfortunately, accurate data are not available as to the incidence of the individual rheumatic diseases in the United States. It has been estimated that in general office or general clinic practice the distribution of rheumatic diseases in 100 patients who complain of rheumatism sufficiently to make them consult a physician is approximately as follows: 1 with rheumatic fever; 2 with gonococcic arthritis; 3 to 5 with miscellaneous forms (tuberculous arthritis, arthritis with ulcerative colitis, Charcot's joints, etc.); 3 to 5 with gout; 7 to 10 with traumatic arthritis; 10 to 20 with nonarticular rheumatism; 25 to 30 with degenerative joint disease, and 30 to 40 with rheumatoid arthritis. It has been reported that in Sweden, in 1943, 0.12 per cent of the population sought medical care because of rheumatic fever; 0.25 per cent because of rheumatoid arthritis; 0.17 per cent because of degenerative joint disease, and 0.4 per cent because of nonarticular forms of rheumatism—a total of 0.9 per cent of the people of that country who were the victims of the rheumatic diseases in that year.

ORGANIZATION OF THE ATTACK AGAINST THE RHEUMATIC DISEASES

It is obvious that a group of diseases having the numerical and economic importance of those with which we are dealing demands an organized effort to combat it. One of the earliest organized attempts to study the rheumatic diseases was started in England with the Cambridge Committee for the Study of Special Diseases; but this was interrupted by the first world war. In 1920, the Ligue Internationale contre le Rheumatisme was established with headquarters at the Hague. Although originally composed principally of European representatives, the Ligue encouraged the establishment in other countries of groups interested in the problem. This movement extended to the United States in 1928 with the formation of the American Committee for the Control of Rheumatism. This committee worked actively to arouse the interest of the profession in the magnitude of the sociologic problem presented and to extend knowledge of the rheumatic diseases by means of publications and through exhibits in connection with the Scientific Exhibit of the American Medical Association. By 1930, it was apparent that there should be a national society for the study and control of the rheumatic diseases, and the American

Table 2.—*Estimated Annual Number of Days Lost from Work or Other Usual Pursuits by Reason of Specific Chronic Diseases (United States, 1937)*

Disease	Annual Number of Days Lost
Nervous and mental diseases	132,500,000
Rheumatism	97,200,000
Heart disease	95,200,000
Arteriosclerosis and high blood pressure	56,900,000
Tuberculosis, all forms	41,400,000
Cancer and other tumors	36,300,000
Nephritis and other kidney diseases	28,400,000
Diseases of the female organs	26,800,000
Hay fever and asthma	21,900,000
Diseases of gallbladder and liver	20,000,000
Diabetes mellitus	19,200,000
Ulcers of the stomach and duodenum	13,600,000
Hernia	13,600,000
Chronic diseases of the skin	10,300,000
Anemia	8,500,000
Diseases of the bladder and urethra	8,200,000
Chronic bronchitis	8,000,000
Chronic appendicitis	7,600,000
Goiter and other thyroid diseases	7,600,000
Other diseases of the circulatory system	6,600,000
Sinusitis	6,000,000
Varicose veins	5,900,000
Chronic tonsillitis and other throat infections	5,400,000
Hemorrhoids	5,100,000
Chronic pleurisy	4,200,000
Chronic diseases of the eye	4,200,000
Chronic diseases of the ear	3,300,000
Disease of the prostate and male genitourinary organs	3,300,000

From The National Health Survey, Bulletin 6, Sickness and Medical Care Series, United States Treasury Department, Public Health Service, 1938.

Rheumatism Association was founded. The association holds yearly scientific meetings, sponsors an extensive annual review of the English and American literature and promotes wider interest and more precise knowledge concerning these disorders. The formation of affiliated societies at state, regional or local levels has been encouraged.

Under the auspices of the Ligue Internationale contre le Rheumatisme six international congresses have been held and the seventh will be held in New York City from May 30 to June 3, 1949.

TABLE 3.—*Classification of Rheumatic Diseases*

- Arthritis due to infection. *Specify joint and infection when known, as:*
  - Arthritis of spine due to tuberculosis
  - Arthritis of knee due to gonococcic infection
  - Arthritis of wrist due to pneumococcic infection
  - Arthritis of knee due to syphilis
- Arthritis due to rheumatic fever. *Record Rheumatic fever as primary diagnosis invariably*
- Arthritis, rheumatoid, of....*Specify as:*
  - Arthritis, rheumatoid, multiple (proliferative arthritis,* atrophic arthritis,* chronic infectious arthritis,* Still's disease *)
  - Arthritis, rheumatoid, of spine (Marie-Strümpell arthritis,* ankylosing spondylitis,* von Bechterew spondylitis,* spondylitis ankylopoietica,* spondylitis rhizomelique *)
- Arthritis due to direct trauma of....*Specify joint and trauma, as:*
  - Arthritis of knee due to contusion
  - Arthritis of elbow due to habitual dislocation
- Neurogenic arthropathy. (Charcot joint *) *Specify joint and cause, as:*
  - Tabetic arthropathy of knee
- Arthritis due to gout. *Specify joint. Record Gout as primary diagnosis invariably*
- Degenerative joint disease, multiple, due to unknown cause (osteoarthritis,* hypertrophic arthritis,* degenerative arthritis,* chronic senescent arthritis *)
- New growths of joints. *Specify joint and neoplasm as:*
  - Synovioma of knee
- Hydrarthrosis, intermittent, of....*Specify joint*
- Fibrositis. *Specify joint or area*
- Myositis, bursitis, neuritis, and neuralgia. *Specify muscle, bursa or nerve involved*
- **Diseases in which arthritis, arthropathy or arthralgia is frequently associated (diagnose disease, list joint manifestation as symptom)**
  - Acromegaly
  - Acute disseminated lupus erythematosus
  - Cyst of meniscus of knee
  - Dermatomyositis
  - Drug intoxication. *Specify drug when known*
  - Erythema multiforme exudativum
  - Erythema nodosum
  - Hemophilia
  - Hysteria
  - Ochronosis
  - Osteochondritis dissecans
  - Osteochondromatosis
  - Periarteritis nodosa
  - Psoriasis
  - Purpura, various types
  - Raynaud's disease
  - Reiter's disease
  - Scleroderma
  - Serum sickness

* Names in parentheses are synonyms.

Just before the entry of this country into the second world war, a committee of the American Rheumatism Association was appointed to study the possibility of undertaking a national fund-raising effort to support research and teaching and the care of patients with rheumatic diseases. This important undertaking was delayed by the outbreak of hostilities, but since the end of the war rapid progress has been made. Under the sponsorship of the American Rheumatism Association, a separate organization, the Arthritis and Rheumatism Foundation, has been founded with a board composed of physicians and influential laymen and with the purpose of organizing the essential appeal for funds on both a national and a local basis. At the same time, the National Research Council has established a committee on the rheumatic diseases, at the request of the American Rheumatism Association, which is making a survey of facilities for patient care, research and teaching and which will evaluate applications for grants in aid of research as the foundation acquires the necessary funds. Thus, at long last, a national program has been inaugurated which can make an organized attack on this serious group of diseases which afflicts so many millions of persons and causes such a vast economic loss to the nation.

CLASSIFICATION

Rheumatic diseases may be roughly divided into rheumatic fever, arthritis and the periarticular and nonarticular forms of "rheumatism" such as fibrositis, bursitis and myositis.

The majority of cases fall into seven important groups: (1) arthritis due to known microbial agents, (2) the arthritis of rheumatic fever, (3) rheumatoid arthritis, (4) degenerative joint disease, (5) arthritis due to direct trauma, (6) arthritis of gout and (7) the nonarticular forms of rheumatism. No classification of diseases can be entirely satisfactory while the etiology of many of those diseases remains unknown. That shown in table 3 is admittedly imperfect, but it has the great merit that it has been adopted as official by both the American Rheumatism Association and the Standard Nomenclature of Disease, and much confusion in terminology will be avoided by its use.

These various forms of rheumatic diseases are discussed in the pages which follow; hence only a few comments are called for at this point:

1. Rheumatoid arthritis. Under this heading are included certain diseases which are thought to be merely variants of classic rheumatoid arthritis, such as Still's disease, Marie-Strümpell or ankylosing spondylitis and arthritis associated with psoriasis. Hence these should be listed as rheumatoid arthritis, but, because the relationship is not established with certainty, the other name should be added in parenthesis.

2. Degenerative joint disease. It is now accepted that this is a process related to advancing age and "wear and tear." Hence it occurs in multiple joints with greater or lesser symptoms in all persons who live long enough. The complete explanation of this form is still lacking, however; hence in table 3 it is noted as "due to unknown cause." Other cases, however, occur in younger persons and usually involve only one or two joints. Careful history and examination will usually reveal one of three predisposing causes in such cases which hastened the wear and tear in those particular joints. These are: (1) congenital defects, (2) previous important injury or (3) previous arthritis of other types. In these instances the predisposing cause should be noted in the diagnosis, as, for example, "degenerative joint disease of right knee secondary to old intracapsular fracture."

3. The term "mixed arthritis" is to be avoided. When employed in the past it has usually been applied to patients who show evidences of both rheumatoid arthritis and degenerative joint disease. A preferable diagnosis in such cases is "rheumatoid arthritis" if that is the cause of the major disability or, rarely, "degenerative joint disease secondary to inactive rheumatoid arthritis" if the latter disease, as such, contributes little to the disability.

ARTHRITIS DUE TO KNOWN MICROBIAL AGENTS

In this section, diseases of the joints caused by the following micro-organisms are described:

Staphylococcus
Streptococcus
Pneumococcus
Gonococcus
Meningococcus
Tubercle bacillus
Treponema pallidum
Brucella

Infections of the joints caused by Eberthella typhosa, Escherichia coli, Bacterium dysenteriae, Leishmania donovani (granuloma inguinale), the virus of lymphogranuloma venereum and certain fungi have not been included because of their relative infrequency.

STAPHYLOCOCCIC, STREPTOCOCCIC, PNEUMOCOCCIC, GONOCOCCIC AND MENINGOCOCCIC ARTHRITIS

Arthritis due to infection with the various pyogenic cocci can be conveniently described as a group because cases due to the different micro-organisms are very similar. These arthritides are often referred to collectively as acute pyogenic arthritis.

Incidence and Pathogenesis.—The incidence of acute infectious arthritis caused by organisms that are sensitive to antibiotic drugs has fallen decidedly during the past decade. Well above half the cases in this group are caused by the staphylococcus and hemolytic streptococcus. The bacteria may reach the synovial tissue by hematogenous dissemination from a remote focus. Staphylococci and hemolytic streptococci may invade the joint by direct extension from a suppurative process in adjacent bone, such as osteomyelitis or epiphysitis. They may also be directly introduced into the cavity by a penetrating wound.

Pathology.—The pathologic changes vary in degree with the severity and duration of the infection. The histologic appearance of the articular structures is that of an acute suppurative inflammation. The synovial tissue is hyperemic, swollen, thickened and infiltrated with cells which are predominantly polymorphonuclear leukocytes. If suppuration continues for several weeks, the leukocytic enzymes digest areas of the articular cartilage with resulting ulceration and irreparable destruction. When there is severe damage of the cartilage, ankylosis may result. Abscesses may form in the marrow of the subchondral bone. The soft periarticular structures often become acutely inflamed.

Symptoms.—The systemic disease may be so severe and the arthritis so relatively mild that the joint infection is overlooked. In other cases the arthritis may be unaccompanied by constitutional signs and the probable primary focus of infection remains obscure. Generally, the onset is sudden with fever, chills, sweats, malaise and anorexia. The joint is exquisitely painful and tender, red, warm and swollen. Its capsule is distended by effusion, and the adjacent muscles are in spasm. Tenosynovitis and bursitis may be associated features. As a rule only one or two joints are affected, commonly the hip, knee, elbow or shoulder, although no joint is exempt. Spondylitis and infection of the sacroiliac joint are exceptional.

Laboratory Observations.—Leukocytosis (15,000 or more) with a rise in the percentage of polymorphonuclear cells is common. The erythrocyte sedimentation rate is elevated. Blood culture will often reveal the causative micro-organism. Special effort should be made to take one or more cultures before chemotherapy is begun. In typical cases the synovial fluid is cloudy or frankly purulent and the leukocytes may number more than 100,000 per cubic millimeter with over 90 per cent polymorphonuclear cells. On bacteriologic examination (both smear and culture) of aspirated synovial fluid the organism causing the arthritis can usually be demonstrated.

Roentgenologic Changes.—These do not appear until the optimum time for successful treatment has passed. They are, therefore, of little diagnostic value. Roentgenograms show abnormalities after the tenth day and indicate the extent of damage to the articular cartilage and to the adjacent bone. They may reveal, in addition, osteoporosis and periostitis, osteomyelitis or epiphysitis.

Diagnosis.—Acute monarthritis of abrupt onset, a red, warm, swollen, exquisitely painful and tender joint, associated with fever, leukocytosis and rapid sedimentation rate is characteristic of suppurative arthritis or acute gout. The presence of bacteremia and the absence of hyperuricemia make the diagnosis of suppurative arthritis almost conclusive. Recovery of the organism from synovial fluid by smear or culture proves the diagnosis.

Prognosis and Course.—The prognosis as to life is generally determined by the nature of the systemic disease and the presence or absence of serious extra-articular complications. Probably the most important factor in determining to what extent joint function will be restored is the time when specific treatment is begun. If therapy is started within the first week of infection the results are decidedly better than when started during the second week. After the third week, the end results are generally poor.

Treatment.—The guiding principles of treatment are to halt the joint infection before the articular cartilage is destroyed and to begin motion before adhesions and muscle atrophy develop. Early bacteriologic diagnosis and prompt chemotherapy are essential. Hemolytic streptococci, pneumococci and meningococci as a rule are sensitive both to sulfonamide compounds and to penicillin. Staphylococci and gonococci are rather susceptible to the action of penicillin and often resistant to the sulfonamide compounds. Both drugs permeate inflamed synovial tissue, and oral or intramuscular administration in adequate dosage obviates the need for intra-articular injections. The average dose used is 40,000 units of penicillin given intramuscularly every three hours, or 1.0 Gm. (grains 15) of sulfadiazine by mouth every four hours until the temperature is normal and the synovial fluid becomes sterile. In severe infections both drugs may be used. When the joint fluid becomes sterile any excess fluid is gradually absorbed after chemotherapy is stopped. If the infectious process does not respond to oral and intramuscular chemotherapy, intra-articular instillation of penicillin (20,000 units in 10 cc. of isotonic sodium chloride solution every twenty-four or forty-eight hours) or in exceptional cases surgical drainage may become necessary. The joint should be immobilized in splints or by traction until the arthritis subsides. Active motion within the range of the patient's capacity to tolerate the discomfort should be instituted as early as possible even while the joint is in cast or traction. This will promote better functional results and shorten the period of disability. Physical therapy may be administered after the temperature has returned to normal and the local infection has subsided.

Features Associated with Specific Types of Pyogenic Arthritis.—In addition to the foregoing general comments, which are applicable to acute arthritis caused by all the pyogenic cocci, certain features of gonococcic and meningococcic arthritis warrant individual mention.

(*a*) Gonococcic Arthritis: Although more than 1,000,000 new cases of gonorrhea occur annnually in this country, the incidence of the articular complications has fallen from 3 to less than 0.5 per cent, largely as a result of the use of penicillin, which cures 95 per cent or more of the cases of uncomplicated gonorrhea. The organism spreads from the primary focus in the genitourinary tract through the lymphatics and blood stream to the synovial tissues. Yet in only 25 per cent of the cases is the diplococcus recovered from the joint fluid, rarely from the blood stream. Arthritis usually appears within ten to thirty days after the initial infection; months to years may, however, intervene between the urethritis and arthritis.

The onset is sudden, usually with an acute migratory polyarthritis which in a few days to a week becomes monarticular. Tenosynovitis occurs more frequently than in any other types of arthritis, particularly when the wrists or small joints of the hands or feet are affected. The constitutional reactions, such as fever, leukocytosis and accelerated sedimentation rate, are less severe than the local signs.

Cultures of exudate and synovial fluid will yield positive results several times more frequently than smears, although occasionally the smear is positive and the culture negative; both procedures should be done. The reaction to the gonococcus complement fixation test becomes positive within ten to thirty days of the onset of arthritis in 90 per cent or more of the cases. Tests should be repeated at weekly or biweekly intervals if results of the earlier ones are negative and the diagnosis remains in doubt. Chemotherapy apparently does not affect the specificity of this test. Since patients whose serum gives a positive reaction may acquire another type of arthritis, this test alone does not prove the diagnosis of gonococcic arthritis. Contrariwise, a negative reaction to a complement fixation test does not exclude such a diagnosis. There are no characteristic roentgen changes in gonococcic arthritis which distinguish it from other types of suppurative joint disease.

The diagnosis of gonococcic arthritis may be made on the basis of (1) history of exposure and typical clinical course, (2) demonstration of the gonococcus in the exudate of the genital tract, (3) positive culture or smear of the synovial fluid, (4) positive complement fixation and (5) recovery or definite improvement with penicillin or sulfonamide therapy. In the absence of (3) the diagnosis is presumptive and in the absence of (3) and (5) it should be carefully reconsidered, as rheumatoid arthritis may prove to be the correct diagnosis. Gonococcic arthritis in its early polyarticular phase often simulates rheumatic fever.

Gonococci are more sensitive to the action of penicillin than are streptococci, and fastness to this drug has not yet been observed. Treatment may be supplemented with sulfadiazine or fever therapy with advantage in stubborn cases. Until these measures bring relief, immobilization will offer the patient considerable comfort.

(*b*) Meningococcic Arthritis: The incidence of articular complication during meningococcic infections has varied with different epidemics from 2 to 20 per cent.

There are two general types of arthritis associated with this disease. One occurs during the first few days and consists of a transient synovitis which resolves spontaneously without progressing to effusion or suppuration. It may develop concomitantly with the generalized purpuric eruption commonly seen in severe meningococcemias. Intra-articular and periarticular petechial hemorrhages have been observed. Multiple joints are affected simultaneously. Arthralgia may be the only manifestation; often, however, the joints are tender and red. Swelling is slight, if present at all, and effusion is exceptional. Normal joint function is restored in a few days.

The second type occurs toward the end of the first week of illness. The meningococci invade and damage the synovial tissue and produce purulent arthritis. This type usually is monarticular. The knee or wrist are most commonly affected; any other peripheral joint may, however, be involved. The joint is acutely inflamed and distended with effusion. A diagnosis of meningococcic arthritis can be proved only by recovery of the organism from the joint fluid. The general prognosis is not significantly influenced by the arthritis. The bacteremia and arthritis usually respond satisfactorily to sulfonamide compounds (orally) or penicillin (intramuscularly).

SYPHILITIC ARTHRITIS

Incidence.—The reported incidence of syphilitic disease of the joints has been declining because of stricter diagnostic criteria and earlier more adequate antisyphilitic therapy. Probably less than 1 per cent of patients with syphilis have arthritis of syphilitic origin, and not more than 0.1 to 0.5 per cent of diseases of the bones and joints in this country are due to syphilis.

Etiology.—Arthritis occurs in the course of both the congenital and the acquired type; it may appear during infancy, childhood or early adult life. In the acquired type it may be due either to direct spirochetal infection of the joints or to neurogenic changes (Charcot's joints) secondary to tabes. The latter constitutes about half of the cases in the acquired group.

Clinical Types and Symptoms.—(*a*) Arthralgia: Vague muscle and joint pains without objective signs of arthritis may occasionally be seen during the height of the systemic reaction in early acquired syphilis.

(*b*) Osteochondritis, Periostitis and Synovitis: Among syphilitic infants osteochondritis (including epiphysitis) and periostitis are commonest. The joint is markedly swollen as a result of periarticular infiltration. Motion is limited (Parrot's pseudoparalysis), but there is practically no pain on manipulation. Among older children (8 to 16 years) symmetric, painless synovitis (Clutton's joints) is the commonest form of syphilitic arthritis. This type is rarely encountered in adults with acquired syphilis. The knees are most commonly affected. There is decided effusion bilaterally without redness and with only slight, if any, pain, tenderness or warmth. There are no bony changes, and ankylosis never results. Response to specific treatment is usually good. Occasionally the process ends spontaneously after following a chronic course. Interstitial keratitis is often associated with Clutton's joints.

(*c*) Gummatous Arthritis: Gummatous arthritis may occur in late tertiary syphilis, congenital or acquired. It is frequently monarticular. A gumma may arise in bone and extend into an adjacent joint, or it may originate in the synovia or other soft articular or periarticular structures. Swelling with little or no pain and without stiffness, local heat or muscle spasm is characteristic. Bone destruction with osteolytic areas is frequently seen on roentgenograms. Response to antisyphilitic therapy is striking.

(*d*) Charcot's Joints: Charcot's joints are seen in about 5 to 10 per cent of patients with tabes dorsalis. The pathogenesis of this form of arthropathy is not clearly understood, but experimental evidence indicates that it is not due to actual trophic changes and suggests that this disorder is merely a rapidly developing degenerative process in joints lacking the protection of pain and position sense and hence used in an awkward and traumatizing manner. The onset may be gradual or sudden and the course progressive or stationary. One large joint of the lower extremities is usually affected, but the process may be multiarticular and occasionally symmetric. The "flail joint" is enlarged, deformed and can be painlessly flexed, extended and rotated to extraordinary degrees in several directions. Warmth, redness and tenderness are absent. On roentgenographic examination there are usually destructive and productive bone changes with pathologic fractures, disintegration and disorganization of the joint. The blood and spinal fluid Wassermann reaction may be negative in cases of "burned out" tabes dorsalis. In such cases neurologic signs of tabes suggest the diagnosis. Antisyphilitic therapy is ineffective but should be administered. Treatment consists of orthopedic measures (mechanical or surgical) for effecting immobilization and stabilization. Fusion has been reported to be successful in carefully selected cases.

Differential Diagnosis.—It is important to establish whether arthritis present in a patient with syphilis is of syphilitic origin or coincidental. A positive Wassermann reaction on the synovial fluid and blood is not conclusive. The diagnosis is proved by (1) unequivocal response to antisyphilitic therapy, (2) positive biopsy of synovial or juxta-articular tissue or (3) positive result from injection of joint fluid or tissue intratesticularly into a rabbit. It is presumptive in the presence of (1) positive serologic reaction, (2) other stigmas of congenital or acquired syphilis or (3) characteristic changes in the bones seen in roentgenograms.

Treatment.—Penicillin is the treatment of choice. A total of at least 4,000,000 units should be given over a period of not less than fifteen days. If aqueous solutions of penicillin are used, individual injections should be given every four hours. If slowly absorbed preparations, such as procaine penicillin in oil and 2 per cent aluminum monostearate, are used, injections of 450,000 to 600,000 units can be given three times a week until ten or twelve injections have been given. If penicillin fails arsenic and bismuth compounds should be tried. The arsenical of choice is arsenoxide (oxophenarsine hydrochloride, dichlorophenarsine hydrochloride or phenylarsine hydrochloride).

TUBERCULOUS ARTHRITIS AND SPONDYLITIS

Incidence.—The incidence of tuberculosis of bone and joints is declining in this country. In approximately 4 per cent of patients with tuberculosis infection of skeletal structures develops, and 1 per cent of the deaths from tuberculosis result from tuberculous spondylitis. In 1947 there were about 400,000 cases (old and new) of tuberculosis in the United States of which approximately 16,000 had involvement of bones or joints.

Etiology and Pathogenesis.—Tuberculosis in man is caused almost exclusively by the human type of bacillus, since less than 0.4 per cent of the cattle in this country are infected. The primary lesion develops in the lung as a result of infection by inhalation. The bacilli spread from this focus to the bronchopulmonary lymph nodes, where, under suitable circumstances, caseation results. Infected lymph nodes are the commonest source of hematogenous dissemination, and organisms may metastasize by this route to bone or directly to synovial tissue.

Tuberculous arthritis generally develops before the age of 14, although not infrequently this disease occurs in patients above 50. Eighty-five per cent of the cases of tuberculosis of the spine begin before the age of 10. Negroes are especially susceptible because of the greater relative incidence of hematogenous dissemination among them.

Pathology.—The joints of the lower limbs are involved much more frequently than those of the upper. The spine (Pott's disease) is affected more often than any peripheral joint. In the spine the lower thoracic and upper lumbar vertebrae are the usual sites. Bone destruction results in collapse of the vertebra and the process then spreads along the anterior or posterior longitudinal ligaments to involve several vertebrae above or below. In some cases infection spreads from one vertebra to the next through the intervertebral disk, which is thus eroded relatively early. When circumstances lead to progression of the disease, tubercles multiply and coalesce, their blood supply becomes inadequate, and necrosis, caseation and eventually liquefaction and abscess formation follow. The abscess usually dissects along a path between fascial planes or muscle bundles and may appear at a distant point, then rupture and leave a discharging sinus. When, however, resistance to invasion is good, the infection may become quiescent and finally arrested. The lesion may then resolve or heal by fibrosis or bony fusion.

Tuberculosis of the peripheral joints may result either from direct bacillary invasion of the synovial tissue (tuberculous synovitis) or from penetration into the joint by tuberculous tissue from adjacent diseased bone (osteoarticular). The granulation tissue which soon forms undermines and separates the articular cartilage. Periarticular swelling with relatively little effusion develops. Caseation, abscess and sinus formation may result. The articular cortex and neighboring bone is often destroyed. The gross pathologic appearance of a tuberculous joint often cannot be distinguished from that of rheumatoid arthritis.

Clinical Types and Symptoms.—(*a*) Tuberculous Spondylitis (Pott's Disease), and Arthritis: Both forms are characterized by an insidious onset, a chronic progressive course protracted for months or years with remissions and exacerbations and the involvement of usually one, occasionally two and rarely three or more joints or vertebrae. Tuberculous arthritis resembles other forms of arthritis in that spasm of the regional muscles is severe and disabling, but it differs from them in that muscle atrophy is relatively early and prominent, while articular pain and tenderness are comparatively late. The typical joint is warm, boggy and swollen. The doughy feeling and swelling are due chiefly to edema and infiltration of the synovial tissue rather than to effusion, which is scanty. Redness may be present early but is usually absent in the advanced stages. Not infrequently the patient emphasizes trauma in the history of events immediately preceding his arthritis. Constitutional symptoms, such as fever, loss of weight or sweating, usually are not conspicuous.

(*b*) Tuberculous "Rheumatism" (Poncet's Disease): Tuberculous rheumatism has been described as a nondestructive tuberculous polyarthritis resembling either rheumatic fever or rheumatoid arthritis, occurring in a patient who has a tuberculous lesion elsewhere. It is doubtful, however, that such an entity exists, and diseases so diagnosed are probably other forms of joint disease occurring in patients who happen also to have extra-articular tuberculosis.

Associated Features and Complications.—Since the tubercle bacilli reach the spine, juxta-articular bone or synovial membrane by the blood stream, it is to be expected that extra-articular tuberculosis may exist. Pulmonary tuberculosis is common; infections of the serous membranes and urogenital tract are less frequent.

The commonest complication is abscess formation in the paravertebral region or in the vertebral bodies when the spine is affected and in the bone or periarticular soft structures when a peripheral joint is involved. Sinuses originating from an abscess or joint often form and when present suggest the diagnosis. In Pott's disease meningitis and paraplegia are not uncommon. When the tuberculous infection is prolonged secondary amyloidosis may result.

Laboratory Observations.—The total and differential leukocyte counts are usually normal. The erythrocyte sedimentation is elevated. On bacteriologic study the tubercle bacillus will be found in the synovial fluid, synovial tissue or the pus aspirated from an abscess or expressed from a sinus. It may be demonstrated by smear or recovered by culture or after inoculation of suitable material into guinea pigs. A biopsy of the synovial tissue will show the pathognomonic tubercle. Lymph nodes in the region of an involved joint may show evidence of tuberculous infection. The total cell count of synovial fluid may vary from 5 to over 100,000 per cubic millimeter, and the differential count is not characteristic, although there may be more lymphocytes and monocytes than in other types of arthritis. The total protein content per hundred cubic centimeters of fluid is increased.

Tuberculin Test: A positive tuberculin reaction is only suggestive evidence of tuberculous arthritis. A negative reaction is strong evidence against the diagnosis.

Roentgenologic Observations.—In a typical case the roentgenogram will fail to show any changes in the early stages of the disease. The first signs consist of a haziness or cloudiness of the joint due to periarticular swelling, synovial effusion and thickening. The joint space is preserved until late. Pronounced decalcification of bone follows the earlier changes, and subsequently marginal erosion with thinning and interruption of the articular cortex is seen. In the advanced stages, as bone destruction progresses, sequestration, abscess and sinus formation may become visible. Calcium deposition and new bone formation are conspicuously absent. These roentgenographic changes are typical, but they are not diagnostic or specific, since similar changes may be seen in other types of arthritis.

Course and Prognosis.—Unless the disease is checked, tuberculous arthritis follows a protracted course of progressive destruction of bone and articular structures lasting several years. Remissions and exacerbations are usually observed. Recovery of normal joint function is rare. Pott's disease carries a decidedly graver prognosis than tuberculosis of a peripheral joint. In no type of arthritis is the mortality rate as high as in tuberculosis of the spine. In one analysis the death rate was 9.5 per cent among patients without extra-articular lesions and 54.5 per cent among those with active tuberculosis of other organs. It is anticipated that the use of streptomycin will improve the prognosis in certain cases.

Treatment.—The same principles which govern the treatment of tuberculosis elsewhere in the body apply when the bones and joints are infected. There is no substitute for prolonged care. The general resistance of the body should be enhanced by appropriate measures, such as rest, good care and nutritious diet.

Treatment otherwise consists of local surgical and mechanical measures and chemotherapy. Among orthopedic surgeons in this country there is a difference of opinion as to the indications or even the merits (i. e., the effect on duration and course of the disease, recurrences, complications and mortality) of surgical intervention as compared with more conservative treatment. Most authorities agree that operation is contraindicated in the presence of actively disseminating lesions elsewhere and that the chances of healing are poor unless the local process has become quiescent and stabilized and further destruction arrested. There is also general agreement that children should be treated preferably by nonoperative measures (traction, splints, braces) since epiphyseal growth is active.

Experience with streptomycin in tuberculous arthritis and spondylitis has been too limited to permit, at this time, a definitive evaluation of its efficacy. In some cases in which it was used, function was restored and healing was attained without surgical intervention; in other cases its preoperative and postoperative administration was attended by satisfactory results and no recurrences; in still others no beneficial effects were observed. Mild to moderate toxic symptoms develop in about half the cases. The bacilli often become resistant to the drug. Final opinion as to optimum dosage has not yet been formulated. At present 1.0 Gm. given daily in divided doses for ninety successive days is considered adequate treatment for the average case.

BRUCELLOSIS

Incidence.—The number of new cases of brucellosis in this country has been increasing steadily. In 1927, there were only 217 new cases; in 1937, 2,497 cases, and in 1947, 6,073 cases. The states that have the largest number of cases are Iowa, Illinois, Texas and Wisconsin. Approximately half of the patients with brucellosis experience arthralgia or myalgia, although only 10 per cent emphasize bone or joint pains as their chief complaint, and in but a fraction of this group does one find objective signs of osteoarticular involvement. Less than 100 cases of spondylitis have been reported in the literature. Permanent joint damage is rarely a result of brucellar infection.

Symptoms.—Brucellosis may assume an acute, chronic or latent form. The common symptoms are fever, chilliness, fatigue, sweating, malaise, generalized pains, headache, depression, nervousness and insomnia. In contrast to the numerous symptoms there are few physical signs. The spleen is enlarged in approximately one third of the cases. At the height of the systemic infection or during convalescence, joint symptoms may develop. Arthralgia or myalgia are common, but inflammatory joint changes are rare. The arthritis, when present, may be migratory, resembling rheumatic fever.

Diagnosis.—There are no pathognomonic clinical features of the systemic infection or the arthritis. A positive culture of blood or synovial fluid is conclusive, but the former is obtained in only 25 per cent of cases and the latter even more rarely. An agglutination test, complement fixation test, bactericidal test, skin test and opsonocytophagic test have been developed but are difficult technically and of limited value because of false negative as well as false positive reactions. No single one of these tests is diagnostic, but, if results of the agglutinin and skin test or other tests in addition are positive, the diagnosis is almost certain.

Prognosis.—The duration of brucellosis is variable and may be protracted. About 3 to 4 per cent of patients succumb to the infection. The arthritis does not influence the prognosis significantly. It is usually mild and rarely results in permanent deformity.

Treatment.—The disease is self limited and subject to spontaneous remissions and cure. Penicillin is ineffective. Streptomycin or sulfonamide drugs used alone may affect the bacteremia but do not substantially alter the course of the disease. It has been reported, on the basis of experimental studies and treatment of a relatively small group of patients with acute and chronic brucellosis, that the combined treatment with streptomycin and sulfadiazine yielded the most satisfactory results. The recommended dose is 0.5 Gm. of streptomycin every six hours given intramuscularly for seven days and sulfadiazine initiated simultaneously with an oral dose of 4.0 Gm. and 1.0 Gm. every four hours for two or three weeks. More recently, aureomycin was found more effective than streptomycin and sulfadiazine and may replace these two drugs in the treatment of brucellosis. Other antibiotics are being investigated.

RHEUMATIC FEVER

Not many years ago it would have been imperative, in a statement of this kind, to point out that rheumatic fever is not primarily a disease of the joints. This is no longer necessary, for the protean nature of the disease and the fact that carditis is its most important manifestation are now common knowledge not only to the physician but also to the layman. It is well known that rheumatic fever not infrequently occurs without any evidence of joint involvement. Nevertheless, the polyarthritis of rheumatic fever is one of the common and important forms of joint disease.

DIAGNOSIS

Rheumatic fever occurs most commonly in children and young adults but not infrequently also in the older age groups. The typical case is easily recognized by: (1) the polyarticular and migratory nature of the joint involvement, (2) the presence of other manifestations of rheumatic fever (such as carditis, subcutaneous nodules, pleuritis, erythema marginatum and chorea) and (3) the dramatic response to the antirheumatic drugs. The typical joint involvement is acute and is accompanied by a temperature of 101 to 104 F., leukocytosis and rapid erythrocyte sedimentation. The reaction to the hemolytic streptococcus agglutination test is uniformly negative, but the antistreptolysin-O titer is high in 90 per cent. Diagnosis is rarely difficult on clinical grounds. Occasionally, however, one encounters atypical cases, especially in adults, without other manifestations of rheumatic fever and in which the joint involvement is limited to only a few joints and tends to remain in those joints in subacute form several weeks in spite of antirheumatic medication. In these atypical cases the antistreptolysin titer provides additional diagnostic aid.

Differential diagnosis usually is easy. However, rheumatic polyarthritis may be confused with acute gout, early rheumatoid arthritis or arthritis of known microbial cause, such as that due to gonococcic infection. The course of disease and the diagnostic features enumerated usually make the correct diagnosis apparent. Response to therapy is particularly informative, for gout responds readily to colchicine whereas rheumatic fever does not, and the latter responds promptly to antirheumatic drugs in contrast to no or slight response in the case of rheumatoid arthritis and gonococcic arthritis. (It must be emphasized that the diagnostic feature of this therapeutic test is the effect on pain and local inflammation rather than on fever, for sufficiently large doses of antirheumatic drugs will cause a sharp drop in fever due to any cause.)

TREATMENT

Therapeutically, the essential problem in rheumatic fever is the carditis. The joint involvement does not lead to permanent damage, and adequate doses of the antirheumatic drugs will cause a prompt subsidence of the arthritis. Acetylsalicylic acid and sodium salicylate are the drugs of choice. An adequate dose is 1 Gm. (grains 15) every hour for six to ten doses the first day or two with gradual reduction at the rate of 1 or 2 Gm. daily unless arthritis returns. Doses of this size may occasionally cause vomiting, and, therefore, medication should be stopped temporarily at the first sign of nausea.

Treatment of carditis can be merely mentioned here. Essentially it is a matter of complete bed rest as long as there is any evidence of continuation of the active rheumatic infection even in low grade form. The weight of evidence indicates that the antirheumatic drugs do not have any curative effect on carditis. The following are useful criteria in deciding when the patient may be allowed out of bed: (*a*) normal temperature and leukocyte count for ten days in the absence of antirheumatic drugs; (*b*) erythrocyte sedimentation rate well on its way to return to normal; (*c*) disappearance of all rheumatic manifestations, such as subcutaneous nodules and skin rashes, and (*d*) atrioventricular conduction time within normal limits.

PREVENTION

The most important recent advances have been in prophylaxis. It is now thoroughly established that recurrences of rheumatic fever can be prevented by the prevention of the hemolytic streptococcic infections which incite them. This can be accomplished in most instances by giving daily doses of sulfadiazine prophylactically throughout the year to children who are known to be susceptible to rheumatic fever. The recommended dose is 0.5 Gm. (grains 7½) once daily for children weighing less than 110 pounds (49.9 Kg.) and 0.5 Gm. (grains 7½) twice daily for those weighing over 110 pounds. Of course, the physician who has a patient on this regimen has a heavy responsibility to watch for possible toxic effects of the drug. During the first five weeks of treatment the child must be observed carefully, with weekly examinations including total leukocyte and differential counts to warn of the possible appearance of granulocytopenia. Fortunately, important toxic reactions are rare and occur in the first five weeks of treatment. Hence, the patient need be examined only at monthly intervals thereafter. Recently, penicillin has been tried in place of the sulfonamide compounds in order to obviate even the slight danger of toxic reactions inherent in the use of the latter. The recommended dose is 100,000 units given by mouth once daily, forty-five minutes before breakfast. Sufficient experience has not yet accumulated to establish the usefulness of penicillin in the prophylaxis of rheumatic fever; however, all indications to date are that it will be as effective as the sulfonamide compounds and that it is probably the drug of choice in view of the lack of important toxic reactions. Unfortunately, the sulfonamide compounds and penicillin are useless once an attack of rheumatic fever has started and they also fail to prevent an attack if given after the inciting hemolytic streptococcic infection has begun.

Clinical Notes, Suggestions and New Instruments

PAPILLARY CYSTADENOCARCINOMA OF THE OVARY

Treated with Large Doses of Testosterone Propionate; Report of a Case

BYRON D. St. JOHN, M.D.
Port Washington, N. Y.

On Oct. 27, 1947, a 43 year old woman was seen with a chief complaint of swelling of the lower part of the abdomen for the previous six weeks and tenderness of the abdomen. The family history revealed that her mother had had cancer of the breast removed seven years previously and was living and well. The patient's past history revealed that she had had the usual diseases of childhood. She had had ventral suspension in 1932. Three months prior to examination she had a fibroadenoma removed from the left breast.

The results of the physical examination were normal except for the observations of the abdomen and pelvis. There was a constant rolling and gurgling of gas; the lower portion of the abdomen was swollen and distended, and the skin appeared stretched and flaky. The liver could not be definitely felt on palpation, but was percussed at the costal margin and measured 7 cm. at the midclavicular line.

Inspection revealed that the mucous membrane of the labia was normal. On digital examination the pelvic floor was found to be relaxed, the cervix was pointing toward the symphysis and was soft and open. In the hollow of the sacrum was a soft mass that felt like a pregnant uterus. Further examination was suspended pending results of an Ascheim-Zondek test. The result of this test was negative. Examination then revealed a normal uterus anterior to the mass described, and a diagnosis of ovarian cyst was made. The patient was sent to the hospital for surgical treatment.

On November 11 Dr. George Granger removed a large doughy-feeling left ovarian cyst and did a hysterectomy; he also removed the normal-appearing right ovary. The pathologic diagnosis was papillary cyst adenocarcinoma of both ovaries. The patient made an uneventful operative recovery, and on November 21 high voltage roentgen therapy was started. It was planned to give her thirty-two treatments comprising a total dose of 2,250 r to each of the four ports. However, the treatments had to be discontinued on December 17 because the patient was too sick to go to the doctor's office.

The patient became worse rapidly, and on December 22 two hard masses, 4 cm. in diameter, were felt in the right lower quadrant of the abdomen. The patient was having crampy pain and was vomiting. She was sent to the hospital for terminal care with a diagnosis of partial intestinal obstruction. A consultation was held, and it was decided that no surgical treatment was indicated. The patient was given morphine every four hours. When this no longer relieved her she was given morphine and scopolamine® every four hours. Dr. Norman Treves was called in consultation and suggested testosterone propionate, 100 mg. three times a week. The patient was moaning constantly and was semicomatose and moderately cyanotic. During this time Wangenstein drainage was operating successfully and her temperature remained normal.

The intestinal tract was emptied by the use of enemas and colonic irrigations, and on December 29 sixteen large bowel movements were reported. Trouble with water balance was now encountered, and edema developed while the patient was receiving 1,500 cc. of isotonic sodium chloride solution intravenously in twenty-four hours. Blood chlorides were 745 mg. per hundred cubic centimeters. Dextrose and sterile water were used, and the water balance was then maintained.

During this time there had been great distention of the abdomen, making it impossible to feel any masses in the abdomen. On Jan. 15, 1948, the abdomen was flat. The masses previously reported in the right lower quadrant were not palpable. On vaginal examination the cervix was fixed and a large mass behind the cervix was noted.

Pelvic examination by Dr. George Granger on January 29 revealed that in the outlet there was no hypertrophy of the clitorus; there was slight relaxation of the posterior wall. Cervical examination showed no erosion or polyps. The cervix pointed toward the hollow of the sacrum. A solid mass, the size of an orange, was felt in the cul-de-sac and extended out to the left, toward the sigmoid, as a shelf. Dr. Granger stated the belief that this mass was due to implants. The right adnexal region was essentially normal.

The patient had now received 1,200 mg. of testosterone propionate.

On February 4 the patient was discharged from the hospital, weighing 90 pounds (41 Kg.). The testosterone propionate therapy was continued at home, and the patient had a tremendous appetite and rapidly gained in strength. On March 5, one month after discharge from the hospital, the patient weighed 107¾ pounds (49 Kg.). She reported that she had unusual energy and an enormous appetite. She complained of some irritation in the region of the clitorus. The clitorus was now found to be enlarged. She complained that her breasts were small and were steadily decreasing in size and that a beard was growing, which had to be shaved each day. The moustache did not require shaving. At this time she had received 2,600 mg. of testosterone propionate.

On March 15 she weighed 111 pounds (50 Kg.) and reported that she had unusual energy, walking 5 miles a day. Her chief complaint about the testosterone propionate was that her voice wavered and cracked like an adolescent boy and that her face was broken out in acne. At this time the patient reported that she had noticed a lump in the epigastrium. The liver edge was felt 2 fingerbreadths below the costal margin, measured 10.5 cm. at the midclavicular line and felt firm. A hard nodule was felt on the surface of the liver.

On April 6 it was noted on pelvic examination that the cervix was slightly movable and that the mass in the cul-de-sac was smaller. The patient now noted that her hair was falling known to be susceptible to rheumatic fever. The recommended dose is 0.5 Gm. (grains 7½) once daily for children weighing less than 110 pounds (49.9 Kg.) and 0.5 Gm. (grains 7½) twice daily for those weighing over 110 pounds. Of course, the physician who has a patient on this regimen has a heavy responsibility to watch for possible toxic effects of the drug. During the first five weeks of treatment the child must be observed carefully, with weekly examinations including total leukocyte and differential counts to warn of the possible appearance of granulocytopenia. Fortunately, important toxic reactions are rare and occur in the first five weeks of treatment. Hence, the patient need be examined only at monthly intervals thereafter. Recently, penicillin has been tried in place of the sulfonamide compounds in order to obviate even the slight danger of toxic reactions inherent in the use of the latter. The recommended dose is 100,000 units given by mouth once daily, forty-five minutes before breakfast. Sufficient experience has not yet accumulated to establish the usefulness of penicillin in the prophylaxis of rheumatic fever; however, all indications to date are that it will be as effective as the sulfonamide compounds and that it is probably the drug of choice in view of the lack of important toxic reactions. Unfortunately, the sulfonamide compounds and penicillin are useless once an attack of rheumatic fever has started and they also fail to prevent an attack if given after the inciting hemolytic streptococcic infection has begun.

(To Be Continued)

Clinical Notes, Suggestions and New Instruments

PAPILLARY CYSTADENOCARCINOMA OF THE OVARY

Treated with Large Doses of Testosterone Propionate; Report of a Case

BYRON D. St. JOHN, M.D.
Port Washington, N. Y.

On Oct. 27, 1947, a 43 year old woman was seen with a chief complaint of swelling of the lower part of the abdomen for the previous six weeks and tenderness of the abdomen. The family history revealed that her mother had had cancer of the breast removed seven years previously and was living and well. The patient's past history revealed that she had had the usual diseases of childhood. She had had ventral suspension in 1932. Three months prior to examination she had a fibroadenoma removed from the left breast.

The results of the physical examination were normal except for the observations of the abdomen and pelvis. There was a constant rolling and gurgling of gas; the lower portion of the abdomen was swollen and distended, and the skin appeared stretched and flaky. The liver could not be definitely felt on palpation, but was percussed at the costal margin and measured 7 cm. at the midclavicular line.

Inspection revealed that the mucous membrane of the labia was normal. On digital examination the pelvic floor was found to be relaxed, the cervix was pointing toward the symphysis and was soft and open. In the hollow of the sacrum was a soft mass that felt like a pregnant uterus. Further examination was suspended pending results of an Ascheim-Zondek test. The result of this test was negative. Examination then revealed a normal uterus anterior to the mass described, and a diagnosis of ovarian cyst was made. The patient was sent to the hospital for surgical treatment.

On November 11 Dr. George Granger removed a large doughy-feeling left ovarian cyst and did a hysterectomy; he also removed the normal-appearing right ovary. The pathologic diagnosis was papillary cyst adenocarcinoma of both ovaries. The patient made an uneventful operative recovery, and on November 21 high voltage roentgen therapy was started. It was planned to give her thirty-two treatments comprising a total dose of 2,250 r to each of the four ports. However, the treatments had to be discontinued on December 17 because the patient was too sick to go to the doctor's office.

The patient became worse rapidly, and on December 22 two hard masses, 4 cm. in diameter, were felt in the right lower quadrant of the abdomen. The patient was having crampy pain and was vomiting. She was sent to the hospital for terminal care with a diagnosis of partial intestinal obstruction. A consultation was held, and it was decided that no surgical treatment was indicated. The patient was given morphine every four hours. When this no longer relieved her she was given morphine and scopolamine[3] every four hours. Dr. Norman Treves was called in consultation and suggested testosterone propionate, 100 mg. three times a week. The patient was moaning constantly and was semicomatose and moderately cyanotic. During this time Wangenstein drainage was operating successfully and her temperature remained normal.

The intestinal tract was emptied by the use of enemas and colonic irrigations, and on December 29 sixteen large bowel movements were reported. Trouble with water balance was now encountered, and edema developed while the patient was receiving 1,500 cc. of isotonic sodium chloride solution intravenously in twenty-four hours. Blood chlorides were 745 mg. per hundred cubic centimeters. Dextrose and sterile water were used, and the water balance was then maintained.

During this time there had been great distention of the abdomen, making it impossible to feel any masses in the abdomen. On Jan. 15, 1948, the abdomen was flat. The masses previously reported in the right lower quadrant were not palpable. On vaginal examination the cervix was fixed and a large mass behind the cervix was noted.

Pelvic examination by Dr. George Granger on January 29 revealed that in the outlet there was no hypertrophy of the clitorus; there was slight relaxation of the posterior wall. Cervical examination showed no erosion or polyps. The cervix pointed toward the hollow of the sacrum. A solid mass, the size of an orange, was felt in the cul-de-sac and extended out to the left, toward the sigmoid, as a shelf. Dr. Granger stated the belief that this mass was due to implants. The right adnexal region was essentially normal.

The patient had now received 1,200 mg. of testosterone propionate.

On February 4 the patient was discharged from the hospital, weighing 90 pounds (41 Kg.). The testosterone propionate therapy was continued at home, and the patient had a tremendous appetite and rapidly gained in strength. On March 5, one month after discharge from the hospital, the patient weighed 107¾ pounds (49 Kg.). She reported that she had unusual energy and an enormous appetite. She complained of some irritation in the region of the clitorus. The clitorus was now found to be enlarged. She complained that her breasts were small and were steadily decreasing in size and that a beard was growing, which had to be shaved each day. The moustache did not require shaving. At this time she had received 2,600 mg. of testosterone propionate.

On March 15 she weighed 111 pounds (50 Kg.) and reported that she had unusual energy, walking 5 miles a day. Her chief complaint about the testosterone propionate was that her voice wavered and cracked like an adolescent boy and that her face was broken out in acne. At this time the patient reported that she had noticed a lump in the epigastrium. The liver edge was felt 2 fingerbreadths below the costal margin, measured 10.5 cm. at the midclavicular line and felt firm. A hard nodule was felt on the surface of the liver.

On April 6 it was noted on pelvic examination that the cervix was slightly movable and that the mass in the cul-de-sac was smaller. The patient now noted that her hair was falling from her head, and she feared that she was going to become bald. She also noticed a tremendous increase in the hair on her legs and pubis. She now weighed 115 pounds (52 Kg.). On April 27 the liver measured 12 cm. at the midclavicular line and the epigastric mass had increased in size. The dose of testosterone propionate was increased to 400 mg. a week given intramuscularly. Visible peristalsis was observed at this examination.

On May 10 the patient weighed 119 pounds (54 Kg.). Her usual weight was 110 pounds (50 Kg.). Her appetite was enormous. Another nodule had appeared on the liver, and it was noted that the cervix had become as soft as the cervix of pregnancy and that it was freely movable. The mass and shelf previously described were now barely palpable. The patient had received 5,600 mg. of testosterone propionate by the intramuscular route, and her main complaint about it was that her voice was so weak she could not call her children or talk on the telephone.

The patient had had constant trouble with her bowels since leaving the hospital three and one-half months previously. She had periods of constipation for several days, which were relieved by small doses of magnesia magma, liquid petrolatum and enemas.

On examination on May 25, two more small nodules were felt in the liver. The cervix was even softer than at the last examination and was freely movable, and the examining finger could be swept completely around the cervix without encountering the mass or shelf previously described. It seemed that the pelvic mass was diminishing in size but that the liver was increasing in size.

On June 14 the patient had had crampy abdominal pains and no bowel movement for six days. A barium sulfate enema revealed an obstruction just above the rectosigmoid, at which point there was total obstruction to the ascending flow of the barium mixture. The patient had received 8,100 mg. of testosterone propionate, and her main complaint concerning it was the weakness of her voice. With diligent nursing care the patient's intestinal tract was emptied. She went on two weeks' vacation away from home by herself and received no attention except the intramuscular injections of testosterone propionate. By August 2 the patient had received 10,000 mg. of testosterone propionate by the intramuscular route. Her liver measured 19 cm. at the midclavicular line; the masses in the liver had coalesced and many small new ones had appeared. The examination of August 14 revealed that the masses in the liver were rapidly increasing in size. On August 25 the patient had complete obstruction. She was sent to the hospital again for terminal care.

The report of September 10 revealed that the patient had had no stool for two and one-half weeks. The abdomen was extremely distended. Her spirits remained high, and she enjoyed her food. Results of repeated enemas were unsuccessful. Because she was not becoming worse as patients usually do at this time, it was decided to do an exploratory laparotomy in an attempt to relieve the obstruction. Operation was performed on September 12. It was not possible to relieve the obstruction. The patient died five hours after the operation.

The total dose of testosterone propionate by the intramuscular route in this case was 14,100 mg. given over a period of nine and one-half months.

POSTMORTEM OBSERVATIONS

Dr. Frank Inda did the postmortem examination.

Gross Pathologic Observations.—The liver weighed 3,000 Gm. The capsular surface showed multiple umbilicated nodules varying in size from 1 to 6 cm. Repeated sections showed massive areas of tumor replacement up to 10 cm. in diameter. Gastrointestinal tract: The serosal surface of the bowel was glistening and failed to show any implants except in the region of the obstruction in the rectosigmoid.

Microscopic Observations.—A metastatic papillary adenocarcinoma was found in the liver and a metastatic carcinoma (miliary lymphatic spread) of the lung, with peripheral atelectasis. Foreign material was aspirated. Examination of the lymph nodes showed metastatic papillary adenocarcinoma. In the gastrointestinal tract there were adenocarcinomatous implants with infiltration of the rectosigmoid. Reticulum cell hyperplasia was observed in the spleen.

SUMMARY

A case of papillary cystadenocarcinoma of the ovary is presented which was treated surgically and with very large doses of testosterone propionate. After the testosterone propionate therapy was started, at which time the condition was considered terminal, the patient enjoyed nine months of vigorous life. She had greater energy and a better appetite than at any other time in her life. Her chief complaint against the testosterone propionate therapy was the weakness of her voice. The trouble with her water balance was thought to be due to the large doses of testosterone propionate, but this was easily handled. The masses in the pelvis and lower part of the abdomen seemed to recede, while the metastases in the liver steadily increased in size.

Addendum.—Pelvic examination of the patient on April 27, 1948, revealed a decrease in the size of the mass in the left adnexal region extending toward the sigmoid.

ACTIVE PULMONARY TUBERCULOSIS TOGETHER WITH ADDISON'S DISEASE

Successfully Treated with Streptomycin and Adrenal Cortex Extract

MARSHALL C. CHENEY, M.D.
Berkeley, Calif.

Case histories of dramatic recovery from active pulmonary tuberculosis as a result of treatment with streptomycin still are rare enough to warrant reporting. Also, in this case Addison's disease had set in and the patient was rapidly becoming worse. Since Addison's disease is so uniformly fatal, possibility of cure by means of streptomycin represents an important gain in the means of defense against this devastating disease.

Reading over the various reports on all types of tuberculosis treated with streptomycin, one notes the extremely cautious conclusions, such as "Streptomycin should be reserved in pulmonary tuberculosis only for patients not doing well on the regular (slow-going) sanatorium regimen of rest, lung deflation and the like." It is evident that much wider study of streptomycin alone and streptomycin in combination with other remedies (para-aminosalicylic acid, "promin" [sodium p,-p'-diaminodiphenylsulfone-N,N'didextrose sulfonate]) is needed before conclusions can be drawn.

My patient was treated successfully at home, after failure of sanatorium care and after the case had been regarded as hopeless. The newer remedies raise the question, "Is the treatment of tuberculosis in the future to be at home rather than the prolonged old style sanatorium care?"

Admitting that all patients do not respond favorably to streptomycin and that some have had toxic damage (at least from the old high dosage treatment without protection of the nerve structures by thiamine), the unbelievable improvement in this patient, after being regarded as incurable, makes it fair to question the generally accepted conclusion of tuberculosis specialists that streptomycin should be reserved for tuberculosis that is not responding well to the old regimen. Obviously, this patient could have been saved over a year of sanatorium care and from approaching death had streptomycin been administered at the outset. Should not every case of active tuberculosis have a trial of streptomycin therapy first?

REPORT OF A CASE

The patient, a young girl aged 22, was sent to me in August 1946 because she had been coughing a great deal, especially at night, for the previous two months. The girl reported that there had been considerable sputum at first, but much less at the time of examination.

The roentgenogram of the lungs showed active tuberculosis of the upper lobe of the left lung, with a thick-walled cavity, 3 cm. in diameter. The remainder of the lungs was normal. The sputum contained numerous acid-fast bacilli. In spite of the observations, the girl appeared in excellent condition, was well nourished and was not feeling sick, though she felt tired, apparently from the intensive course she was taking at a local business school.

Checkup on the family (father, mother, brother), including roentgenograms of the chest, showed all in good health, without a trace of tuberculosis.

The girl was sent immediately to a lung specialist in San Francisco, Dr. Sidney J. Shipman, who placed her in Ross Sanitorium in Marin County, Calif. Routine rest was started; the left lung was partially collapsed by pneumothorax, but adhesions prevented a complete result. On this account, a series of operations was started, to cut the adhesions.

During the winter of 1946, and especially in the spring of 1947, the reports from the sanatorium were not good. In spite of sanatorium care, the tuberculous infection not only continued active in the left lung, but also appeared in the right lung.

In addition to the spread of the tuberculous process to the right lung, some disturbing digestive symptoms had appeared and were interfering with eating and hence maintenance of a good weight. The digestive upsets (intense nausea and vomiting and, later, pain) at first came at the onset of the menstrual period and gradually lasted longer, until the patient was eating almost nothing for as long as six or seven days at a time, often vomiting the blandest foods.

There was a peculiar nervousness along with the digestive upsets, which led to the idea that there might be a purely psychic factor associated with sanatorium life. However, a visit home (spring and summer, 1947) under her mother's supervision did not influence the digestive upsets, which began to appear even without reference to the catamenia.

The patient lost more weight during the summer, finally could not take any milk and frequently vomited her meals, no matter how small the amount or how carefully selected. Her weight gradually dropped from about 135 pounds (61 Kg.) to 98 pounds (45 Kg.), and it became evident that unless the digestive difficulty, as well as the advancing tuberculosis in the lungs, could be stopped, she could not recover.

She was sent home again from the sanatorium but was soon admitted to St. Joseph's Hospital in San Francisco for review of the tubercular condition. Feeling that the infection had gotten into the abdomen, and because of the close association of the digestive upsets with the catamenia, a gynecologist, Dr. Cooley, was called into consultation. He examined the pelvis and found no definite tuberculosis of the pelvic organs.

Again she was sent home with instructions to spare no effort to solve the digestive difficulty. Feeling that tuberculous ulceration of the bowel might be causing the serious symptoms, she was placed in Alta Bates Hospital in Berkeley for gastrointestinal examination, partial obstruction of the bowel being carefully looked for. No evidence of tuberculosis of the bowel could be found at any point and no signs of obstruction, except some spasm in the second portion of the duodenum which seemed to hold food back somewhat. A surgeon, Dr. Dexter Richards, was called into consultation and, observing the flat abdomen and so little evidence of organic obstruction, advised against any surgical treatment.

Again the patient was sent home, but review of all the possibilities now suggested that Addison's disease was a factor in the case. There was no question about her having tuberculosis, at least in the lungs. The digestive upsets were consistent with Addison's disease, and the nervousness was exactly of the type described as occurring in this illness. In addition, she was having exhaustion spells in which she suddenly felt as if she were dying. The systolic blood pressure was ranging from 110 to 90. The absence of tuberculosis in the gastrointestinal tract, pelvis and kidneys aided in pointing the way to tuberculous involvement of the adrenal glands. However, no calcification was evident in roentgenograms of the adrenal areas.

Treatment with injection of adrenal cortex extract ("eschatin") and with streptomycin was begun. Improvement was evident within a week; the digestive upsets gradually lessened, and the diet was normal by the time the three months' streptomycin therapy was complete. Treatment was started with the original full dose of streptomycin, i. e., 1 Gm. a day, in divided doses at the beginning, and the dose cut to 0.5 Gm. a day during the latter part of the three months' treatment, because of general agreement that the smaller dose would be just as effective for the tuberculosis and much less likely to cause toxic symptoms. This patient displayed no toxic symptoms even on full dosage (possibly due to large doses of vitamin B), but she was so emaciated that it was extremely difficult to find sufficient sites for the injections.

All injections were administered by the patient's mother. Not one injection was missed, and much effort was put into selection and preparation of foods that might possibly agree. As the girl's appetite improved and she began to gain weight, extra effort was put into the supplementary feeding.

By the spring of 1948, it was evident that a cure had been accomplished. The roentgenograms of the lungs now showed no activity of the tuberculosis, the cavity had disappeared and there was no activity found on the weekly check-ups by the lung specialists in San Francisco. Pneumothorax of the left lung and bed rest were continued, though the patient's strength had returned. Finally, the time up and about during the late spring and summer, i. e., from one or two hours to four or more hours, were gradually increased. Some of this time was spent outdoors in sunlight, which was permitted because she felt better after sunning herself. Also, a sun lamp was used all through the winter and early spring.

Her weight by summer was up 34 pounds (15 Kg.), and she was tanned, active and in good health. Interest in normal girls' social pursuits returned. All symptoms of her sickness had disappeared. The only remedies now were some capsules of cortical adrenal hormone (now replacing the injections of adrenal cortex extract) and some vitamin tablets. She spent the summer at an altitude (Tahoe) and in September 1948 reported herself in good condition. The periodic reviews by the lung specialists support the idea that the tuberculosis has been eradicated.

Close observation will continue at least another year. Meanwhile, the lung specialist permits the cautious diagnosis, "presumably arrested tuberculosis," at the same time recognizing the miraculous improvement.

NOTE: At the time of last examination (Jan. 7, 1949) the patient was in excellent condition. Roentgenograms revealed no active tuberculosis of the lungs. Periodic examinations (every two weeks) by Dr. Shipman have revealed no activity.

The Salpêtrière.—The greatest neurologist of all time, Charcot's name will always be associated with his old hospital in Paris, the Salpêtrière. The hospital got its queer name from the fact that it once served as an arsenal and thus became a center for the storage of saltpeter, the essential ingredient of gunpowder. Sometime in the 17th Century it was converted into an asylum for old women and later, after Pinel's time, into a hospital for the mentally disturbed, epileptics and patients with a wide variety of nervous diseases. To this hospital in 1848 came the young Charcot as a medical student, the son of a professional carriage builder who had considerable artistic talent, an inheritance that became well marked in his famous son. . . . After four years of internship at the Salpêtrière, Charcot practiced medicine for a few years before returning in 1862 to his old hospital as one of the chiefs of medical service. . . . His crowning achievement in neuropathology was his studies in cerebral localization. . . . His name is remembered in the artery of Charcot, Charcot's disease, amyotrophic lateral sclerosis and the changes in the joints in tabes dorsalis. . . . He was, indeed, the founder of modern neurology and his studies in cerebral localization led directly to the development of neurosurgery.—Henry R. Viets, The History of Neurology in the Last One Hundred Years, *Bulletin of the New York Academy of Medicine*, December 1948.

Council on Physical Medicine

REPORTS OF THE COUNCIL

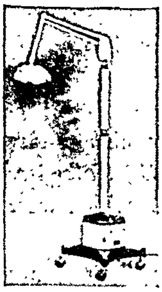
The Council on Physical Medicine has authorized publication of the following reports: Howard A. Carter, *Secretary.*

GENERAL ELECTRIC MODEL H PRESCRIPTION ULTRAVIOLET LAMP ACCEPTABLE

Manufacturer: General Electric X-Ray Corporation, 4855 W. McGeoch Avenue, Milwaukee 14.

The General Electric Model H Prescription Ultraviolet Lamp is a device for the therapeutic administration of ultraviolet radiation, and includes not only the burner itself but also a housing with reflector and shutter, an adjustable "floating arm" and an upright stand borne on four casters.

The lamp proper is of the high pressure mercury vapor hot-quartz Uviarc type which emits a spectrum rich in wavelengths throughout the therapeutic zone of ultraviolet from 2,200 to 3,200 angstrom units. It requires 110 to 120 volts of alternating current for operation. The Model H Type 1 lamp has a 360 watt burner, and the lamp itself operates on 115 volt 60 cycle and draws 9 amperes and 1040 watts. The Model H Type 2 lamp has a 250 watt burner and can be supplied to operate from either 115 volt 60 cycle, drawing 7.7 amperes and 900 watts, or 115 volt 25 cycle, drawing 9.9 amperes and 1,100 watts.



G. E. Model H Prescription Ultraviolet Lamp.

The height of the apparatus as a whole is given as 154 cm. (60½ inches) and the width as 42 cm. (16½ inches). The weight is 24 Kg. (52 pounds). The shipping weight is 39 Kg. (85 pounds). Accessories include two pairs of goggles for protection against ultraviolet light.

In a test it was found that the minimum erythemal dosage averaged 75 to 90 seconds at 18 inches (45.7 cm.) from the Model H Type 2 250-watt lamp. The Model H Type 1 360-watt lamp will produce the same reaction in 50 to 65 seconds.

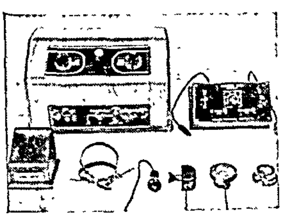
Evidence was obtained from sources acceptable to the Council that the lamp complies with the minimum requirements for acceptance both in spectral quality and total intensity, that its clinical performance was as claimed and that the lamp was convenient to move and operate.

The Council on Physical Medicine voted to include the General Electric Model H Prescription Ultraviolet Lamp in its list of accepted devices.

SONOTONE AUDIOMETER, MODEL 21, ACCEPTABLE

Manufacturer: Sonotone Corporation, Elmsford, N. Y.

The Sonotone Audiometer, Model 21, is an instrument designed to test the sense of hearing by supplying pure tones at frequencies from 125 to 8,192 cycles per second at various degrees of loudness. It is contained in a walnut-finished case 27 by 28 by 48 cm. (10½ by 11⅛ by 19 inches). Accessories include: 2 air conduction receivers and cords; 1 bone conduction receiver and cord; 1 control unit, with switching arrangements to allow testing with a receiver on each ear; 1 microphone and cord; 1 single headband; 1 double headband; 1 power cord, and 1 signal switch and cord. Without the accessories, the audiometer weighs 10.9 Kg. (24 pounds). With them, it weighs 14 Kg. (31 pounds), and the shipping weight is 30 Kg. (66 pounds). Its power consumption is 50 watts (0.4 ampere) at 115 volts; it operates on either direct or alternating current.



Sonotone Audiometer, Model 21

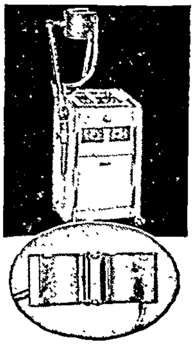
It was tested under clinical conditions in a laboratory acceptable to the Council, and was reported to be reliable and durable.

The Council on Physical Medicine voted to include the Sonotone Audiometer, Model 21, in its list of accepted devices.

FISCHER DELUXE SHORT WAVE DIATHERMY MODEL 400 ACCEPTABLE

Manufacturer: H. G. Fischer and Company, 9451 West Belmont Avenue, Franklin Park, Ill.

The Fischer DeLuxe Short Wave Diathermy Unit, Model 400, is an apparatus designed to administer diathermy within the wave bands allocated by the Federal Communications Commission (Type Approval D-479, 11.06 meters, 27.120 megacycles) by induction electrode and induction cable. It can also be used for coagulation and cutting in electrosurgical procedures. The apparatus as a whole is in the form of a console or cabinet mounted on four casters and stands 86 cm. high (34 inches). The other dimensions are 86 by 51 cm. (34 by 20 inches), and the weight is 47 Kg. (103 pounds). The shipping weight is 78 Kg. (167 pounds). Accessories include a flexible arm assembly and an adjustable induction electrode. For operation, a 120 volt alternating current is needed, and 900 watts are drawn.



Fischer De Luxe S. W. Dia. Unit, Model 400.

The apparatus has been accepted for listing by Underwriters' Laboratories, Inc. Measurements of power output were made by the lamp load method in a laboratory acceptable to the Council, and the highest figure obtained was 310 watts.

The Council on Physical Medicine voted to include the Fischer DeLuxe Short Wave Diathermy Model 400 in its list of accepted devices.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

PROTEIN HYDROLYSATES (See New and Nonofficial Remedies 1948, p. 416).

The following dosage forms have been accepted:

Abbott Laboratories, North Chicago, Ill.

Solution Aminosol 5% W/V: 500 cc. and 1,000 cc. infusion solution containers. A modified fibrin hydrolysate 5 per cent. Each 100 cc. represents 5 Gm. of protein equivalent to about 20 calories.

Solution Aminosol 5% W/V with Dextrose U.S.P. 5% W/V: 500 cc. and 1,000 cc. infusion solution containers. A modified fibrin hydrolysate 5 per cent with dextrose 5 per cent. Each 100 cc. represents 5 Gm. of protein and 5 Gm. carbohydrate equivalent to about 40 calories.

Solution Aminosol 5% W/V with Dextrose U.S.P. 5% W/V and Sodium Chloride 0.3%: 1,000 cc. infusion solution containers. A modified fibrin hydrolysate 5 per cent with dextrose 5 per cent and sodium chloride 0.3 per cent. Each 100 cc. represents 5 Gm. of protein and 5 Gm. of carbohydrate equivalent to about 40 calories.

MERCUROPHYLLINE INJECTION-U.S.P. (See New and Nonofficial Remedies 1948, p. 319).

The following dosage form has been accepted:

The Smith-Dorsey Company, Lincoln, Neb.

Solution Mercurophylline: 1 cc. and 2 cc. ampuls.

INDEXES AND ABSTRACTS OF MEDICAL LITERATURE

Since the end of World War II attention has been focused on the potential development of an index to the medical literature of the world sufficiently comprehensive to serve the needs of investigators, teachers, practicing physicians and all others interested in medical science. Apparently the scientific literature of the world includes some 25,000 publications; certainly there are some 6,000 of these containing material of pertinent interest to the medical profession.

The Index Medicus has been published by the American Medical Association under the title of the Quarterly Cumulative Index Medicus for many years. Recently its appearance has been delayed because of difficulties with the printing trades, difficulties in securing medical periodicals from all over the world and the maintenance of a system of selection which would supply all that is important to the various groups that have been mentioned. Under the auspices of the Division of Medical Sciences of the National Research Council a committee has been established which is now investigating every aspect of the indexing problem. Its ultimate goal may well be the publication of an index once each month of the important medical literature of the world in a form suitable to the types of readers mentioned, other users and also to librarians. The publication of a complete index to all medical literature that might be useful for all these groups would represent a cost so great that support for it is at present not visible. The committee is considering the needs of various groups and endeavoring to arrive at recommendations which will lead to progress.

In 1947 the British Medical Association began publication of two periodicals devoted to abstracts of medicine and to surgery, obstetrics and gynecology; it is considering other publications to supplement these two publications. An attempt is not made to abstract all articles published in all medical journals. A selection is made of periodicals considered worthy of study—approximately 1,000—and from these are chosen for abstract articles judged to be useful to medical readers.

In 1947 the government of the Netherlands subsidized the publication of a monthly abstracting service of articles from every available medical journal in the world under the title *Excerpta Medica.* This is published in fifteen sections and covers the whole field of clinical and experimental medicine. Many hundreds of abstracters throughout the world cooperate in this project. The organization, which is under the general editorship of M. W. Woerdeman, professor of anatomy and embryology at the University of Amsterdam, is growing in scope. Already many of the sections are in process of developing their third volume. Recently the *Excerpta Medica* was reorganized on a not for profit basis; a conference to be held by UNESCO in June will determine the extent to which that agency can support a further development of the various abstract services now available. At present physicians will find the *Excerpta Medica* the most comprehensive and prompt abstracting of the medical literature of the world thus far available.

Information indicates that German publishers are considering the possibility of reviving the *Zentralblätter* and similar abstracting services in German which were published previously to the war.

In the United States the current medical literature department of THE JOURNAL makes available numerous abstracts each week. The specialized periodicals of the American Medical Association and several others devoted wholly to abstracts of medical literature are also available for subscription by American readers. The International Abstract of Surgery, which appears monthly in *Surgery, Gynecology and Obstetrics,* is also one of the most comprehensive and useful abstract services for use by surgeons.

Obviously great sums of money are being spent by many different agencies in an effort to reach a much needed goal. Perhaps under the leadership of the World Medical Association, the World Health Organization or UNESCO, or by a combined committee developed from all of these groups, some coordination may be secured which would lead to a more comprehensive product than is now in sight. The American Medical Association is participating in these conferences, since the Association is represented in all the world groups that have been mentioned.

More recently the Editor of THE JOURNAL has been associated by action of the Board of Trustees with the publication of *Excerpta Medica.* This association is designed to bring about a system of the type so badly needed. Particularly in view is a possible coordination between abstracting services and indexing. As soon as the publication of the Quarterly Cumulative Index Medicus is brought up to date, the editors hope to indicate in the Index the references to abstracts that will be easily available in *Excerpta Medica.* This should enhance the value of both the Index and *Excerpta Medica.*

Medical periodicals exist by the support of physicians and medical institutions. The publication of the Index Medicus has been carried on by the American Medical Association for many years with a considerable contribution from the funds of the Association. *Excerpta Medica* likewise is still published at a loss which could be largely overcome if enough physicians gave their support either to the total publication or to the individual sections in which they happen to be interested. Since medical progress is dependent on the rapid dissemination of medical information, this important publication merits support.

LICENSURE OF FOREIGN MEDICAL GRADUATES

The statement issued by the Committee on Foreign Medical Credentials which appears elsewhere in this issue offers a statesmanlike approach to the problems involved in the licensing of foreign-trained physicians. The Committee, which is an unofficial body sponsored by the Council on Medical Education and Hospitals and composed of invited representatives from a number of organizations, has summarized the principal problems and has presented recommendations as to how they may be solved.

The quality of education a physician receives during his medical school years is as important in determining his fitness to practice medicine as is his performance on licensure examinations. These, of necessity, are limited in the extent to which they can test his knowledge and skill. In licensing graduates of American and Canadian medical schools, the state licensing boards for many years have had the benefit of the findings of thorough periodic surveys of these schools carried out by the Council and the Association of American Medical Colleges. It has been beyond the resources of these bodies to make similar studies of the medical schools in other parts of the world. Other agencies have not been discovered which can furnish adequate information. Many state boards, therefore, have been reluctant to admit foreign-trained physicians to examinations. This reluctance has been justified because medical education in many foreign countries has been inferior to medical education in this country. In many of the countries that previously maintained high standards, medical education has deteriorated during the past fifteen to twenty years as the result of political upheavals, the crushing impact of the war and the unsettled economic and political conditions that have prevailed since the close of the war.

The Committee has drawn attention to these problems but has also recognized that in some foreign countries high standards of medical education comparable to those in the United States have been maintained. The Committee therefore has stated that the various agencies concerned with the problem should unite their resources and devise a satisfactory method for securing reliable information concerning foreign medical schools at the earliest possible date. When such information is obtained, it should be possible for the accrediting agencies to prepare a list of foreign medical schools whose graduates may be considered to have received training comparable to that offered by medical schools in this country. It would then seem reasonable that the state boards and the National Board of Medical Examiners admit graduates of these schools to examinations, provided they can demonstrate sufficient familiarity with recent scientific advances, with the practices and custom of American medicine and with the English language. The Council on Medical Education and Hospitals will probably give major consideration to this suggestion at its next meeting.

The Committee is to be congratulated on the statement which it has prepared. This statement should receive wide attention from the public as well as the state licensing boards. Undoubtedly it will prove to be an extremely useful instrument for promoting better understanding and better management of a problem that demands an intelligent and enlightened solution.

SALARY MINIMUMS FOR PUBLIC HEALTH PHYSICIANS

The Executive Board of the American Public Health Association[1] has recently released a statement of recommendations of minimum salary scales for physicians in full time public health work. Five salary grades are recommended:

1. Physicians employed in a full time position for training in public health should receive an annual salary of at least $6,000 if they have an M.D. degree from a recognized medical school, have completed an internship and are eligible for licensure in the state in which they work.

2. Physicians employed in a full time position as a clinician, health officer of a small unit, or an assistant administrator, should receive an annual salary of at least $8,500 if they have the following basic qualifications:

(*a*) A degree of Doctor of Medicine from a recognized medical school.

(*b*) One year of internship and eligibility for licensure.

(*c*) A master's degree in public health (which includes some field experience) or demonstrated knowledge and experience equivalent to that represented by this degree.

3. Physicians with these basic qualifications who in their past experience have shown administrative ability should receive an annual salary of at least $10,000 if they carry the responsibility for administering a single program in a state health agency or a large local health agency (e. g., program for cancer control, mental hygiene, tuberculosis or crippled children) or serve as health officer of a moderate-sized local health unit, or carry equivalent responsibility.

---

[1] Clearing House on Public Health Salary Information, editorial, Am. J. Pub. Health **39**: 376 (March) 1949.

4. Physicians with the basic qualifications and demonstrated ability to administer responsible public health programs should receive an annual salary of at least $12,000 if they carry heavy responsibility such as administering multiple programs in a state health agency (e. g., directors of local health administration preventable disease control), or serve as health officer of a large local health unit or carry equivalent responsibility.

5. Physicans with these basic qualifications and outstanding demonstrated ability to administer public health programs should receive an annual salary of at least $15,000 to $20,000 if they carry great responsibility in positions such as the health officers and deputies of our states, major cities and very large local units carry.

An acute shortage of personnel now exists, partly due, no doubt, to the low salaries paid to public health officials in comparison with net income received by most general physicians. A survey by the Placement Service of the American Public Health Association showed on Oct. 1, 1948: 766 vacant positions listed in contrast to 91 applicants for these positions. One recent study [2] has demonstrated that $9,819 in 1948 is only the equivalent of $5,000 in 1939 in purchasing power for a family of four. Salaries of public health personnel have not increased proportionately to wages in other fields. Wages in manufacturing industries increased by 100 to 140 per cent between 1940 and 1948. The median salary of full time public health physicians in state agencies in 1948 was $6,000 to $6,400. This is much lower than net incomes of most general practitioners in the United States.

Emphasis on the importance of public health programs, and the scope and activities of public health physicians, have greatly increased during the past ten years. A specialty board, The American Board of Preventive Medicine and Public Health, has been recently established, thus giving recognition to physicians in public health similar to that for specialists in other fields of medicine.

The undoubted importance of the work of public health physicians to the health of the people of the United States while recognized theoretically has never been adequately compensated. The outstanding reason for this is, of course, that such work is essentially impersonal, concerned not with individuals but with people in the mass and with environmental and social conditions as causes of disease. An extremely significant part of the present high level of health of the American people is due to outstanding successes in the preventive approach to disease by workers in public health.

Salary levels on which these physicians are now compensated are disgracefully low. Immediate advancement to levels at least proportionate to incomes of other medical specialists is essential to prevent further losses of trained and efficient personnel.

THE "MOORE" AMENDMENT TO THE FOOD, DRUG AND COSMETIC ACT

An amendment, known as the "Moore" amendment, has been proposed to modify the Federal Food, Drug and Cosmetic Act. If it is enacted, proof of wilful intent or gross negligence would be required before a criminal conviction for violation of the Federal Food, Drug and Cosmetic Act could be obtained. Under the Act adulteration or misbranding of any food, drug, device or cosmetic is a misdemeanor punishable by fines or even imprisonment. If intent to defraud can be proved, the penalty is more severe. Requirement of proof of intent as proposed by the "Moore" amendment would, no doubt, make effective enforcement difficult, if not impossible.

The manufacture and distribution of drugs in the United States is a major industry which affects the health of the people. In general, the drugs in this country are the best in the world; they provide a persuasive example of what can be accomplished in a country where incentive, competition and freedom are dominant motivations. Any proposal that would seriously change existing practices, therefore, should be studied carefully for fear that it might lower the present high standards to those of even a decade ago.

The Federal Food, Drug and Cosmetic Act, like other public protective laws, including traffic laws, does not require proof of negligence or intent as an element of a violation. The purpose of such statutes is the achievement of social betterment rather than the punishment of crimes. The provision in the federal drug law for criminal penalties against traffic in adulterated or misbranded drugs without proof of wilful intent or criminal negligence is simply indicative that the chief concern of the physician and his patient is the quality of the drug. Whether or not the vendor of a harmful or impotent drug was conscious or unconscious of the violation is not a medical or health problem.

The law places on the drug manufacturer the obligation of determining that his drugs are both safe and efficacious before he vends them. Food and drug legislation from its beginning has stemmed from the unusual responsibility held by those who produce and handle such essentials as foods and drugs. The significance of this is obvious when the history of an amendment to the Food and Drugs Act of 1906 is reviewed: This amendment (known as the Sherley Amendment of 1912) required proof of fraud or wilful intent in cases against false claims of therapeutic effect on labels. Because of the extreme difficulty of proving the state of mind of the manufacturer, only after deletion of the requirement of proof of fraud in writing the present law, enacted in 1938, were the more evil influences brought under reasonable control.

---

[2] Where Buying Power Goes Up, U. S. News & World Rep. **25:** 19 (Aug. 13) 1948.

When a violation occurs, the Act requires an administrative hearing preliminary to criminal prosecution, at which time the defendant may attempt to show why prosecution should not be brought. Furthermore, intent has never been a condition to a violation of even the Anti-Trust law, which is generally considered the most prominent law governing commerce. The person who drives through a red light and kills a child is guilty of violation of the law, whether or not he deliberately committed the act. The same is true of the manufacturer who exercises such poor control that his products are potential lethal agents instead of being curative.

The people and the medical profession are entitled to maximum assurance that the drugs they use are safe and efficacious. What consolation can either the people or the physicians obtain after an injury or fatality has resulted directly from the use of a harmful drug or indirectly from the use of an impotent or adulterated drug if investigation indicates that the manufacturer did not wilfully ship such an article or that he was not grossly negligent? Any proposed amendment to the Federal Food, Drug and Cosmetic Act which would condone harmful practices or mitigate their penalties should not be enacted.

Current Comment

THE WISCONSIN MEDICAL BLUE BOOK

For a number of years the State Medical Society of Wisconsin has designated the January issue of its journal as the Medical Blue Book. Included are abstracts of the more important state licensure laws, articles on medicolegal subjects, discussions on operations to produce sterility, the relation of the physician to the workmen's compensation act, suggestions as to the content of leases for office space entered into by physicians, laws relating to the collection of accounts, malpractice, income tax requirements, the medical witness and expert testimony and a wide variety of other subjects. This year the Blue Book has been published as a permanent volume, containing information similar to that previously in the regular January issues of the journal. Such issues will hereafter be utilized as a supplement to the permanent volume, adding new information and bringing up to date the information contained in that volume. Members of the state society should find this a most valuable service. Complimentary copies of this publication have been sent by the state society to all junior and senior medical students in the two medical schools in Wisconsin. Other medical associations might well consider the desirability of making available a similar publication to their members. The Indiana State Medical Association initiated such a project in 1948. More recently the Florida Academy of Public Medicine has prepared for transmittal to members of the state medical association a brief summary of the licensure laws and contemplates extending this summary to include other matters of medicolegal significance.

CONTROL OF RABIES

A conference on rabies involving New Jersey, Pennsylvania and New York was held recently.[1] Dr. Bishop, speaking for Pennsylvania, stated that prevention, control and eradication of rabies in animals are under the jurisdiction of the Bureau of Animal Industry with veterinary practitioners primarily responsible for reporting. Laboratory examination of suspected rabies specimens is made without charge. In cases in which a microscopic examination of the brain proved negative and there was no history of exposure to human beings, the brain examination was regarded as final. When a definite history of human exposure exists, the animal inoculation test is made. Dr. Robert F. Korns, director of the Bureau of Epidemiology and Communicable Disease Control of the New York State Department of Health, pointed out that the problem of rabies control in New York State has become one of fox control rather than dog control, since the former animal is now the chief vector. Dr. Alexander Zeissig expressed the belief that at least 15 per cent of positive cases of rabies would be missed if the inoculation test were not used. Dr. James H. Steele indicated that the existence of the disease was established after two blind passages in white mice after failure to discover Negri bodies. The disease in these cases did not appear until the twenty-eighth or the twenty-ninth day, a fact indicating that the incubation period is longer than the twenty-one days generally accepted. A case of rabies has not thus far been established in rats. In New York State, control of the dog has become secondary to vaccination as a control measure, and the chief reliance is now on vaccination. When a rabid animal is reported in an area, that area is immediately quarantined and the vaccination program is instituted. The objective of mass vaccination is the building of a high percentage of immune animals in the dog population so that both dogs and human beings are protected against the rabid animals. Dr. Korns cited four measures necessary to an effective rabies control program: (1) as good a dog management program as one can get; (2) mass vaccination; (3) rabies advisory councils, and (4) a planned educational program. At present New York State's control efforts to reduce rabies in wild life, in which the fox appears to be the primary vector, consist of utilizing professional trappers to reduce the fox population in areas as large as 50 square miles, with the idea of creating adjoining zones of scarcity that act as buffers against extension of the disease. During an eight month period, twenty-seven professional trappers took 4,000 foxes from three controlled areas. Rabies in the fox is a disease of population peaks, rabies being a natural biologic control that reduces their numbers. The reduction of animals of New York seems best accomplished by utilizing professional trappers for a ten month period. The usual period in which a rabid dog may bite a person or another animal runs from three to five days. Rabid cattle are generally not vicious and are not important as transmitters of rabies, the chief importance being economic loss.

ORGANIZATION SECTION

Washington Letter

(From a Special Correspondent)

April 11, 1949.

Investigation of Drug Prices Asked

Peoples Lobby, Inc., one of the oldest organizations of its kind in the National Capital, has requested President Truman to order a Federal Trade Commission investigation of retail prices of medicines, vitamins and surgical instruments and equipment. Benjamin C. Marsh, secretary of People's Lobby, Inc., wrote the President: "It is obvious that the full health program you are urging will not be enacted into law at this session of Congress, and also that your program should be modified. Much of the medical and dental care and treatment you advocate must be furnished by government, partly the federal government, since those who most need medicine and care cannot afford to pay for it. We earnestly request, therefore, that you have the Federal Trade Commission investigate prices of medicines and vitamins and ascertain whether there is any collusion in price setting to account for present price levels, far beyond the reach of many patients."

Federal Aid to Education Attacked as Unwise

The Council of State Chambers of Commerce, with headquarters in Washington, issued a statement on April 8 opposing Congressional enactment of legislation for financial aid to education, including subsidization of medical schools. Although S. 246, the $300,000,000 aid bill which has been favorably reported to the Senate, was singled out for attack, the Council's criticism is applicable as well to pending bills which would authorize federal support of medical, dental and nursing education.

"It seems that the pressure groups having a vested interest in the spending of this federal school aid money have become a bit alarmed at the prospect that the people in the forty-eight states might be told about how much they would pay as well as receive under the proposed aid bill," the Council stated. "So they have begun to protest in advance. They refer to it as a 'transparent' argument. But we believe the American people won't be fooled again. Particularly right now, when the spenders in Washington are urging new taxes to balance a bloated Federal budget."

Veterans Administration Reports Good Results with Hemiplegics

Physical medicine technics in treatment of hemiplegic patients are highly efficacious, according to the findings of a study conducted by the Veterans Administration hospital at Dearborn, Mich., and made public at Veterans Administration headquarters in Washington. Of 48 patients reported on and who underwent treatment since Jan. 1, 1948, 30 have been discharged to their homes, 2 sent to domiciliary homes and 1 transferred to another veterans hospital for further rehabilitation. Twelve of the 33 formerly were confined to bed and 5 were wheelchair patients. All are now able to walk. Treatment averaged ten weeks in length, with a span from one week to ten months. Duration of the hemiplegic condition before physical medicine procedures were instituted averaged ten months, with a range of one month to five years.

Dr. James A. Shannon Joins Heart Institute

Surgeon General Leonard A. Scheele, of the U. S. Public Health Service, has announced the appointment of Dr. James A. Shannon as associate director of National Heart Institute in charge of research. Dr. Shannon comes to the Institute from the Squibb Institute for Medical Research. Dr. Scheele stated that "in order to return to the field of clinical investigation, Dr. Shannon has resigned a position of outstanding importance, that of director of the Squibb Institute for Medical Research, which position he has held since April 1, 1946."

Expand Free Radioisotope Program

The U. S. Atomic Energy Commission on February 27 announced that all radioisotopes heretofore sold to qualified cancer research workers have now been placed on the free list. Previously available without charge for production costs were radioisotopes of iodine, phosphorus and sodium. The new policy adds more than 50 elements to the list, including cobalt 60, which holds promise as an eventual substitute for the more costly radium, and the radioisotopes of gold and carbon. Announcing the expansion, Dr. Shields Warren, director of the Commission's Division of Biology and Medicine, said that it is made possible through improvement of isotope production technic at Oak Ridge National Laboratory (Tennessee) and at Argonne National Laboratory, Chicago.

To finance the new program for its first year of operation, $450,000 has been allocated. Sole charge to researchers will be $10 per shipment, to cover packaging, monitoring, accounting and billing, plus cost of transportation. When request is made for synthesizing the radioisotope into a chemical compound, the recipient will be charged for the labor involved. Allocations of radioisotopes will be for the following purposes: (1) cancer studies performed with use of animals, (2) research programs on basic cellular metabolism of cancerous cells and (3) experimentation toward evaluation of therapeutic uses of radioactive materials.

Applications for radioisotopes for use in human subjects must be approved by the human applications subcommittee of the Commission's Isotope Distribution Committee. Criteria are: (1) the physician using the materials must be associated with an institution qualified for their proper use; (2) use of the radioisotopes must be approved by the institution; (3) clinical users shall be physicians in good standing with their respective medical societies and must have had previous clinical experience with radiation.

Veterans Administration Appoints Medical Directors

The following have been appointed by Veterans Administration as area medical directors, with the responsibility of supervising Veterans Administration hospital and medical activities in their respective regions of the country: Dr. Frank B. Brewer, with headquarters in Atlanta; Dr. Francis B. Carroll, Boston; Dr. Einar C. Andreassen, Fort Snelling, Minn.; Dr. Charles H. Beasley, St. Louis, and Dr. Cyril H. C. Francis, San Francisco. A sixth appointee, Dr. Delmar Goode, will be stationed at the central office in Washington as supervisor of medical department operations in the District of Columbia and vicinity. Establishment of the area medical offices results from abolition of the Veterans Administration's thirteen branch offices, each of which had its own medical director.

Dr. Pereira Betancourt Arrives for U. S. Tour

The Department of State has announced the arrival in this country of Dr. Julio Pereira Betancourt, director of the Children's Hospital at La Paz, Bolivia, whose purpose is to visit hospitals, medical schools and medical centers for the next three months. His trip has been arranged under the Department's travel grant program. A founder of the Bolivian Pediatrics Society, Dr. Pereira is professor of medicine at the University of La Paz and has had special training in children's diseases at the Children's Hospital in Buenos Aires.

Dr. Kiefer Relieves Dr. Crabtree at N. S. R. B.

Official announcement is expected in mid-April that Dr. Norvin C. Kiefer has relieved Dr. James A. Crabtree as chief of the division of medical services, National Security Resources Board. Dr. Kiefer formerly was director of the health emergency planning unit in the U. S. Public Health Service. Dr. Crabtree's new appointment will be announced later.

Coming Medical Meetings

American Medical Association, Atlantic City, June 6-10. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

Alabama, Medical Association of the State of, Montgomery, April 19-21. Dr. Douglas L. Cannon, 519 Dexter Ave., Montgomery 4, Secretary.
American Academy of Tuberculosis Physicians, Atlantic City, Hotel Dennis, June 4. Dr. Oscar S. Levin, P. O. Box 7011, Denver 6, Colo., Secretary.
American Association of Genito-Urinary Surgeons, White Sulphur Springs, W. Va., Greenbrier Hotel, May 9-11. Dr. Norris J. Heckel, 122 S. Michigan Ave., Chicago 3, Secretary.
American Association of the History of Medicine, Lexington, Ky., May 23-24. Dr. Benjamin Spector, 416 Huntington Ave., Boston 15, Secretary.
American Association on Mental Deficiency, New Orleans, Hotel Roosevelt, April 27-30. Dr. Neil A. Dayton, Box 51, Mansfield Depot, Conn., Secretary.
American Broncho-Esophagological Association, Chicago, Drake Hotel, April 18-19. Dr. Edwin N. Broyles, 1100 N. Charles St., Baltimore 1, Secretary.
American College of Radiology, Atlantic City, Chalfonte-Haddon Hall, June 5. Mr. William C. Stronach, 20 N. Wacker Drive, Chicago 6, Secretary.
American Dermatological Association, Hot Springs, Va., May 23-26. Dr. Louis A. Brunsting, 102 Second Ave. S.W., Rochester, Minn. Secretary.
American Gastro-Enterological Association, Atlantic City, Claridge Hotel, June 3-4. Dr. Dwight L. Wilbur, 655 Sutter Street, San Francisco 2, Secretary.
American Goiter Association, Madison, Wis., Hotel Loraine, May 26-28. Dr. Thomas C. Davison, 478 Peachtree St., N.E., Atlanta 3, Ga., Secretary.
American Laryngological Association, New York, May 16-17. Dr. Louis H. Clerf, 1530 Locust St., Philadelphia, Secretary
American Laryngological, Rhinological and Otological Society, Chicago, Drake Hotel, April 18-20. Dr. C. Stewart Nash, 277 Alexander St., Rochester 7, New York, Secretary.
American Ophthalmological Society, Hot Springs, Va., The Homestead, June 2-4. Dr. Maynard C. Wheeler, 30 W. 59th St., New York, Secretary.
American Orthopedic Association, Colorado Springs, May 18-21. Dr. C. Leslie Mitchell, Henry Ford Hospital, Detroit 2, Secretary.
American Otological Society, New York, May 18-19. Dr .Gordon D. Hoople, 713 E. Genesee St., Syracuse, N. Y., Secretary.
American Pediatric Society, Atlantic City, May 5-6. Dr. Henry G. Poncher, 1819 W. Polk St., Chicago 12, Secretary.
American Physiological Society, Detroit, April 19-22. Dr. Milton O. Lee, 2101 Constitution Ave., Washington 25, D. C., Executive Secretary.
American Proctologic Society, Columbus, Ohio, May 31-June 4. Dr. W. Wendell Green, 1838 Parkwood Ave., Toledo 2, Ohio, Secretary.
American Psychiatric Association, Montreal, Canada, May 23-27. Dr. Leo H. Bartemeier, General Motors Bldg., Detroit 2, Secretary.
American Radium Society, Atlantic City, June 5. Dr. Hugh F. Hare, 605 Commonwealth Ave., Boston 15, Secretary.
American Society for Clinical Investigation, Atlantic City, May 2. Dr. Paul B. Beeson, Grady Hospital, Atlanta 3, Georgia, Secretary.
American Society for Experimental Pathology, Detroit, April 18-22. Dr. Frieda S. Robscheit-Robbins, 260 Crittenden Blvd., Rochester, N. Y., Secretary.
American Society for Pharmacology and Experimental Therapeutics, Detroit, April 18-22. Dr. Harvey B. Haag, Medical College of Virginia, Richmond 19, Secretary.
American Society for Research in Psychomatic Problems, Atlantic City, Chalfonte-Haddon Hall, April 30-May 1. Dr. Sydney G. Margolis, 714 Madison Ave., New York 24, Executive Secretary.
American Society of Biological Chemists, Detroit, April 17-22. Dr. Otto A. Bessey, 1853 W. Polk St., Chicago 12, Secretary.
American Surgical Association, St. Louis, April 20-22. Dr. Nathan Womack, University of Iowa, Iowa City, Secretary.
American Therapeutic Society, Atlantic City, June 2-5. Dr. Oscar B. Hunter, 915 Nineteenth St. N.W., Washington, D. C., Secretary.
American Urological Association, Los Angeles, Hotel Biltmore, May 16-19. Dr. Thomas D. Moore, 899 Madison Ave., Memphis 3, Tenn., Secretary.
Arizona State Medical Association, Tucson, May 8-10. Dr. Frank J. Milloy, 15 E. Monroe St., Phoenix, Secretary.
Association for the Study of Internal Secretions, Atlantic City, June 3-4. Dr. Henry H. Turner, 1200 N. Walker St., Oklahoma City 3, Secretary.
Association of American Physicians, Atlantic City, May 3-4. Dr. Henry M. Thomas Jr., 1201 N. Calvert St., Baltimore 2, Secretary.
California Medical Association, Los Angeles, May 8-11. Dr. L. Henry Garland, 450 Sutter St., San Francisco 8, Secretary.
Connecticut State Medical Society, New Britain, State Teachers' College, May 3-5. Dr. Creighton Barker, 258 Church St., New Haven, Secretary.
Federation of American Societies for Experimental Biology, Detroit, April 18-22. Dr. Milton O. Lee, 2101 Constitution Ave., Washington 25, D. C., Secretary.
Georgia, Medical Association of, Savannah, Hotel De Soto, May 10-13. Dr. Edgar D. Shanks, 478 Peachtree St., N.E., Atlanta, Secretary.
Hawaii Territorial Medical Association, Honolulu, May 5-8. Dr. Harry L. Arnold Jr., 510 S. Beretania St., Honolulu, Secretary.
Illinois State Medical Society, Chicago, Palmer House, May 16-18. Dr. Harold M. Camp, 224 S. Main St., Monmouth, Secretary.
International Congress on Rheumatic Diseases, New York, Hotel Waldorf-Astoria, May 30-June 3. Dr. Philip S. Hench, Mayo Clinic, Rochester, Minn., Chairman, American Committee.
Iowa State Medical Society, Des Moines, April 18-21. Dr. Allan B. Phillips, 406 Sixth Ave., Des Moines 9, Secretary.
Kansas Medical Society, Topeka, May 9-12. Dr. D. D. Vermillion, 512 New England Bldg., Topeka, Secretary.
Louisiana State Medical Society, New Orleans, May 5-7. Dr. P. T. Talbot, 1430 Tulane Avenue, New Orleans 13, Secretary.
Maryland, Medical and Chirurgical Faculty of the State of, Baltimore, April 26-27. Dr. George H. Yeager, 1211 Cathedral St., Baltimore 1, Secretary.
Massachusetts Medical Society, Worcester, May 24-27. Dr. H. Quimby Gallupe, 8 Fenway, Boston 15, Secretary.
Minnesota State Medical Association, St. Paul, Municipal Auditorium, May 9-11. Dr. B. B. Souster, 496 Lowry Medical Arts Bldg., St. Paul 2, Secretary.
Mississippi State Medical Association, Biloxi, May 10-12. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.
National Tuberculosis Association, Detroit, May 2-6. Dr. H. Stuart Willis, 1790 Broadway, New York 19, Secretary.
Nebraska State Medical Association, Omaha, Hotel Paxton, May 2-5. Dr. R. B. Adams, 1315 Sharp Building, Lincoln 8, Nebraska, Secretary.
New Jersey, Medical Society of, Atlantic City, Hotel Ambassador, April 25-28. Dr. Earl L. Wood, 315 W. State St., Trenton 8, Secretary.
New Mexico Medical Society, Roswell, May 5-7. Dr. H. L. January, 221 W. Central Ave., Albuquerque, Secretary.
New York, Medical Society of the State of, Buffalo, Hotel Statler, May 2-6. Dr. Walter P. Anderton, 292 Madison Ave., New York 17, Secretary.
North Carolina, Medical Society of the State of, Pinehurst, The Carolina, May 9-11. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.
North Dakota State Medical Association, Minot, May 14-17. Dr. O. A. Sedlak, 702 First Ave. S., Fargo, Secretary.
Ohio State Medical Association, Columbus, April 19-21. Mr. Charles S. Nelson, 79 E. State St., Columbus 15, Executive Secretary.
Oklahoma State Medical Association, Tulsa, Mayo Hotel, May 15-19. Mr. R. H. Graham, 210 Plaza Court Bldg., Oklahoma City, Secretary.
Rhode Island Medical Society, Providence, May 11-12. Dr. Morgan Cutts, 106 Francis St., Providence 3, Secretary.
Society of American Bacteriologists, Cincinnati, May 15-20. Dr. John Blair, Hospital For Joint Diseases, New York, Secretary.
South Dakota State Medical Association, Yankton, May 22-24. Dr. Roland G. Mayer, 22½ S. Main St., Aberdeen, Secretary.
Southeastern Surgical Congress, Biloxi, Miss., May 23-26. Dr. Benjamin T. Beasley, 45 Edgewood Ave. S.E., Atlanta 3, Ga., Secretary.
Texas, State Medical Association of, San Antonio, May 2-5. Dr. Harold Williams, 700 Guadalupe St., Austin, Secretary.
Western Association of Industrial Physicians and Surgeons, Los Angeles, Hotel Biltmore, May 7. Dr. Christopher Leggo, Crockett, Calif., Secretary.
Western Branch of American Public Health Associaiton, Los Angeles, Hotel Biltmore, May 30-June 1. Mr. Walter S. Mangold, University of California, Berkeley, Calif., Secretary.

Medical Legislation

STATE LEGISLATION

Arizona

Bill Enacted.—H. 82 has become chapter 42 of the Laws of 1949. It is a rather complete revision and reenactment of the medical practice act and provides among other things for the right to make use of the injunctive process in enforcing the provisions of the act and provides further that the giving or receiving of rebates shall be construed to be within the meaning of the term "unprofesional conduct."

Arkansas

Bills Enacted.—H. 52 has become Act No. 283 of the Acts of 1949. It provides that any inhabitant of the state over the age of 21 years and of sound mind may, by an instrument in writing, dispose or make arrangements for the disposition to be made of his body or any part or organ thereof after death, provided the disposition of said body or parts thereof is made for the purpose of advancement of medical science or for the replacement of diseased or worn out parts of other humans or for the rehabilitation of human parts or other organs. H. 225 has become Act No. 247 of the Acts of 1949. It amends the basic science act by exempting chiropractors therefrom. H. 363 has become Act No. 346 of the Acts of 1949. It requires the Committee on Admissions of the School of Medicine of the University of Arkansas to allocate position vacancies in the school by congressional districts based on the population of each district. Applicants from counties of low population will be given priority within each congressional district when such applicants are willing to certify their intent to practice medicine upon the completion of their training in a community of two thousand people or less. H. 385 has become Act No. 302 of the Acts of 1949. It provides that the membership on the state board of health shall consist of nine members, seven of whom shall be chosen from the seven congressional districts of the state. Such members must be graduates of a legally constituted and reputable medical college and of at least seven years' experience in the practice of their profession and of good professional standing. These appointments shall be made by the governor from a list of not less than three names presented by the Arkansas Medical Society. S. 275 has become Act No. 258 of the Acts of 1949. It requires all physicians, surgeons, hospitals and druggists who might be called upon to render first aid treatment to report all cases of knife wounds treated by them to the office of the sheriff of the county.

Delaware

Bill Introduced.—H. 419 proposes to require all persons teaching in the public schools and all persons hereafter making application to teach in the public schools of the state to submit to a psychiatric examination before continuing or being accepted to teach.

Georgia

Bill Enacted.—H. 155 has become Governor's Act No. 245 of the Acts of 1949. It provides that any **applicant for a marriage license** must present a certificate signed by a qualified physician licensed to practice medicine and surgery in any state or United States territory stating that the applicant has been given an examination and that in the opinion of the examining physician the applicant is not infected with **syphilis** in a communicable stage.

Illinois

Bill Introduced.—H. 484 proposes to authorize the Department of Registration and Education to issue **licenses** to practice **chiropractic,** which is defined as a philosophy, science and art of things natural, a system of locating misaligned or displaced vertebrae of the human spinal column; the procedure preparatory to, and the adjustment by hand of, such misaligned or displaced vertebrae of the human body, without the use of drugs or surgery, for the correction of the cause of disease together with the use of scientific instruments for analysis. S. Res. 32 proposes a resolution opposing the enactment by the Congress of the United States of any program of **national compulsory health insurance** and proposing that the senators and representatives from Illinois be requested to oppose and vote **against** any such proposed **legislation.** S. 223, to amend the law relating to **prenatal examination tests** by physicians, proposes to require also a standard serological test for the Rh factor.

Iowa

Bill Enacted.—H. 300 was approved March 30, 1949. It provides regulations for the licensing of practical nurses.

Kansas

Bill Introduced.—H. 420 proposes the enactment of a food, drug and **cosmetic act** providing among other things, that any **drug sold at retail** containing any quantity of aminopyrine, barbituric acid, pituitary, thyroid, sulphonmethane or their derivatives shall be sold only on the **written prescription** of a physician, dentist or veterinarian licensed by law to administer such drug.

Minnesota

Bill Enacted.—H. 183 has become chapter 160 of the Laws of 1949. It authorizes persons to **dispose of their bodies** in whole or in part **by will** to a teaching institution, university, college, state board of public health or legally licensed hospital, either for use as such institution, university, college or hospital may see fit, or for use as expressly designated in the will. S. 834 has become chapter 195 of the Laws of 1949. It authorizes the state **live stock sanitary board** to license institutions desiring to obtain impounded animals for purposes of scientific investigation.

Montana

Bill Enacted.—H. 285 has become Chapter 172 of the Laws of 1949. It authorizes autopsies or **postmortem examinations** upon dead bodies in cases where dissection, autopsy or postmortem examination is directed or authorized by the last will and testament of the deceased and in cases where the husband, wife or next of kin shall in writing authorize dissection, autopsy or postmortem examination for the purpose of ascertaining the cause of death. All dissections, autopsies or postmortem examinations involving dissection of any part of the human body shall be performed by a physician or surgeon duly licensed to practice such profession by the state board of medical examiners and upon completion of such examination the physician shall deliver a written report thereof together with his findings as to the cause of death to the next of kin of the decedent or the representative of the decedent's estate or to other persons lawfully requesting such procedures.

New Hampshire

Bill Enacted.—H. 246 has become chapter 102 of the Laws of 1949. It authorizes the **state board of health** to purchase **antitoxins,** other serums, vaccines and immunizing agents when it deems it advisable in the interest of public health and to make rules and regulations for the **free distribution** of such biologicals.

New Jersey

Bills Introduced.—A. 447 proposes the creation of a state board of **examiners in medical technology** which is defined to mean the science or technic of performing laboratory tests, investigations, analyses or examinations of any fluid, excretion or secretion of the human body, or of any organism contained therein for the use of any licensed member of the healing arts in the course of his practice. Two members of the board would be required to be pathologists. A. 511 proposes to authorize a **local** board of health to **quarantine** any person afflicted with **tuberculosis** of the lungs in a communicable form diagnosed as such by a licensed physician after examination by x-ray or finding of tubercle bacilli in the sputum or gastric washings. S. J. R. 6 proposes the establishment of a temporary committee to be charged with the duty of investigating or causing to be investigated and of studying and evaluating present facilities and resources and future needs for the prevention, care, treatment and rehabilitation of **the chronic sick** in the state.

New Mexico

Bills Enacted.—H. 147 has become chapter 139 of the Laws of 1949. It amends the law relating to the **board of medical examiners** by requiring that the five members thereof be appointed from a list of names of qualified persons submitted to the governor by the New Mexico Medical Society. S. 248 has become chapter 108 of the Laws of 1949. It requires every physician attending a **pregnant woman** for conditions relating to the pregnancy to take or cause to be taken a **sample of blood** of such woman at the time of the first examination and to submit the same to an approved laboratory for a standard serological test for **syphilis.**

North Carolina

Bills Introduced.—H. 490 proposes to make it unlawful for anyone other than a pharmacist to deliver **barbituric acid** to any person and then only upon an original prescription of a person licensed by law to prescribe barbiturates. H. 602, to **amend the food and drug act,** proposes that if a drug is sold at retail and contains any quantity of aminopyrine, barbituric acid, conchophen, dinitrophenol, sulfanilamide, pituitary, thyroid or their derivatives it must be sold on the written prescription of a member of the medical, dental or veterinary profession who is licensed by law to administer such drug, or else must be labeled in a certain manner. H. 686, to amend the law relating to **osteopathy,** proposes to authorize osteopathic physicians to use medicinal preparations which are purchasable by the general public without a physician's prescription. S. 198 proposes to authorize and **impower the North Carolina Medical Care Commission** to establish and promulgate rules and regulations whereby physicians, dentists, pharmacists and nurses receiving loans from the state shall receive a credit on such loan for each year of practicing his or her profession in a rural area in the state. S. 352 proposes that any person may by will **dispose of all or part of his body** to a teaching institution, university, college, the State Department of Health, legally licensed hospital or any other legally licensed hospital, agency or commission operating an eye bank, bone or cartilage bank, a blood bank or any other bank of a similar nature and kind designated for the rehabilitation of the maimed.

Bills Enacted.—H. 111 was ratified March 22, 1949. It makes it the duty of every **physician to notify** the local **health officer** of the name, address and such other items as might be required of any person by whom the physician is consulted professionally and who is found to have **cancer** of any type, or who is suspected of having cancer of any type. S. 96 was ratified March 22, 1949. It requires all physicians and midwives having charge of a birth of a **prematurely born infant** to give immediate **notification** thereof to the local health department of the county in which the infant was born.

North Dakota

Bill Enacted.—S. 28 was approved March 12, 1949. It requires every physician or other person authorized by law to practice obstetrics who attends a pregnant woman in North Dakota for conditions relating to pregnancy during the period of gestation or at delivery to take or cause to be taken a sample of blood of such woman at the time of the first professional visit or within ten days thereafter and to submit such sample to an approved laboratory for a standard **serological test for syphilis.** S. 226 was approved March 18, 1949. It prohibits the **delivery of barbiturates** to any person except by a pharmacist on an original **prescription** from a person licensed by law to prescribe and administer barbiturates.

Ohio

Bills Introduced.—H. J. Res. 32 proposes the creation of a **committee to investigate** and examine the operations and activities of various **boards** of examiners, including the **medical examiners,** and to make recommendations for the elimination of any irregular or corrupt practices that may exist and to report such irregularities to the attorney general for prosecution. H. 301 proposes the creation of a state **board of chiropractic examiners** and defines chiropractic to be the art and science of locating, the procedure preparatory to adjusting and the adjusting by hand of the subluxations of the articulations of the spinal column which is deemed to be the twenty-four movable vertebrae, including the sacrum and coccyx and adjacent tissues, for the purpose of removing any interference with nerve transmission; but it shall not include surgery or the administration or prescription of any drug included in materia medica. H. 308 proposes to make it unlawful to deliver any of **the barbiturates** except by a pharmacist on the original prescription of a person licensed in the state to prescribe and administer drugs. H. 116 proposes the creation of a commission to study the problem created by **chronic alcoholics** throughout the state and to advise on the feasibility of state institutions for their treatment. H. 451 proposes that any person subject to arrest found in a **coma, semi-coma, unconscious** or **semi-conscious** condition shall not be detained in any municipal or county jailhouse until a competent physician licensed to practice in the state of Ohio shall have **certified** that such **detention** will not be detrimental to the health of such person. H. 564 proposes the creation of a **health commission** to make a comprehensive **study** of all laws relating to the health and welfare of the citizens of the state, and the administration of health laws of the state, and to study and investigate such laws for the purpose of recommending changes or **revisions of the present health system.** H. 613 proposes the creation of a **state board of naturopathic examiners** and defines naturopathy as that philosophy and system of the healing art embracing prevention, diagnosis, and the care of and treatment of human ills, diseases, traumas, deformities, and functions by the use of the several properties of air, light, heat, cold, water, mechanics, electricity, manipulation, and psychology, together with the use of such substances, largely nutritional, of plant, animal or mineral origin as are naturally found in and required by the body. Naturopaths would not be permitted to practice major surgery or use x-ray, radium, and radioactive substances for therapeutic purposes, or to prescribe for internal use any substance required by law to be labeled poison.

Oklahoma

Bill Introduced.—S. 253 proposes to amend the medical practice act so as to permit the state board of medical examiners to issue **temporary licenses** to applicants desiring a license only for the purpose of serving a residency in the state in a hospital approved for resident training by the State Board of Medical Examiners. The temporary license would expire at the end of a calendar year or at the expiration of the resident training and may be renewed for not more than two additional years on approval of the State Board of Medical Examiners.

Oregon

Bill Introduced.—S. 406 proposes the creation of a **state board of massotherapy examiners** and defines massotherapy as the art of kneading, *rubbing and massaging of the human body with or without such* appliance as steam bath, vapor bath, electric light bath, electric vibrator for hygienic or remedial purposes to maintain health and establish a normal condition of the body.

Bill Enacted.—S. 213 has become chapter 162 of the Laws of 1949. It amends the osteopathic act by providing that the **practice of osteopathy** and surgery by a duly appointed member of the resident staff or by an intern while actually serving as such in any legally incorporated osteopathic hospital shall not be governed by the act. The law also authorizes the board of osteopathic examiners to accept a **certificate of** successful **examination** issued by the National Board of Examiners of Osteopathic Physicians and Surgeons.

Pennsylvania

Bills Introduced.—H. Res. 26 and H. Serial No. 36 propose to memorialize the Congress of the United States to defeat the passage of the **Wagner-Murray-Dingell socialized medicine bill.** H. 1177 proposes that every employer of one hundred or more persons shall employ or **engage one or more licensed physicians** who shall be present to render *medical assistance at all necessary times at the place where work is in* progress. H. 1209 proposes to authorize the board of health to furnish **free** or at less than cost **insulin treatments** to certain persons suffering from **diabetes** and who are without adequate funds to pay for such treatments. H. 1210 proposes to authorize the department of health to furnish **free** or less than cost **streptomycin treatments** to certain persons suffering from **tuberculosis** who are without adequate funds to pay for such treatments.

Rhode Island

Bill Introduced.—H. 792 proposes to require **physicians and osteopaths** to register their licenses annually. H. 924, to amend the administration act of 1939, proposes to authorize the division of professional regulation to appoint examiners for electrolysis and the basic sciences. The proposal then provides that one member of each of the **chiropractic, osteopathic and electrolysis boards** shall be a physician licensed to practice medicine in the state of Rhode Island and that membership on the basic science board shall be made up of two members selected from the faculties of Brown University, Providence College and Rhode Island State College who are full time professors or associate or assistant professors in the basic sciences and one member who shall be a pathologist of training and experience sufficient to give him a broad knowledge of the subject. S. 229 proposes the creation of a **basic science examining board.**

South Carolina

Bills Introduced.—H. 1233 proposes the creation of a State **Licensing Board for the Healing Arts.** Applicants who have complied with all the requirements of the law relating to the practice of specified branches of the healing art shall be entitled upon filing of duplicate certificates with the State Licensing Board for the Healing Arts to apply to the Licensing Board for the Healing Arts for a license to practice the special branch of the healing art for which such certificate was filed. "But no such applicant, as a matter of right, shall be entitled to have the license issued by the State Licensing Board for the Healing Arts, it being the purpose and intent of this Act to give to the State Licensing Board for the Healing Arts an over-all supervision, discretion and judgment with respect to the issuance of licenses authorizing the licensee to practice the healing art or any branch thereof within the State of South Carolina, and the State Licensing Board for the Healing Arts as herein created and constituted shall have the power and it shall be its duty to inspect and determine for itself and in the interest of the State that each and every certificate issued by any board authorized by law to receive applications, conduct examinations and make a preliminary determination of the fitness of any applicant for a license to practice the healing art or any branch thereof, was lawfully issued by such board and truly and correctly certifies all the facts therein contained." H. 1284, to amend the law relating to **naturopathy**, proposes a new definition of naturopathy as follows: the use and practice of psychological, mechanical and material health sciences to aid in purifying, cleaning and normalizing human tissues for preservation or restoration of health according to the fundamental principles of anatomy, physiology and applied psychology, as may be required. Naturopathic practice employs among other agencies, heat, light, water, electricity, psychology, diet, massage and other manipulative methods. These agencies are known as psychotherapy, suggestotherapy, hydrotherapy, electrotherapy, mechanotherapy, biochemistry, external appliances, mechanical and electrical appliances, hygiene, first aid, sanitation, heliotherapy and dietetics. H. 1440 proposes to repeal the **naturopathic practice act.**

South Dakota

Bills Enacted.—H. 217 was approved Feb. 23, 1949. It repeals existing state laws relating to the practice of medicine and the practice of osteopathy and creates a state **board of medical and osteopathic examiners** of which one member is a doctor of osteopathy. Applicants for a license to practice either medicine or osteopathy would take the same examination except that medical applicants would be examined in the practice of medicine and osteopathic applicants in the practice of osteopathic medicine. Licenses must state upon their face whether or not the licensee is licensed to practice medicine or surgery or osteopathic medicine and surgery. S. 167 was approved Feb. 25, 1949. It permits the organization of **cooperative associations** for the construction and operation of hospitals and provides for medical services. S. 271 was approved March 2, 1949. It permits the newly created board of **medical and osteopathic examiners** to grant temporary licenses to practice when the board by resolution finds that an urgent need exists in any part or portion of the state. The temporary license shall be issued and effective for such period as the board shall determine not exceeding four years from the date of issuance and it shall entitle the person to whom issued to engage in the practice of medicine, surgery and obstetrics and their branches during the period specified in such license in such portion or part of the state as may be designated.

Tennessee

Bill Introduced.—H. 978 proposes the creation of a state **board of examiners** for **naturopathy** and defines naturopathy as the prevention, diagnosis and treatment of human injuries, ailments and diseases by the use of such physical forces as air, light, water, vibration, heat, electricity, **psychotherapy**, neuropathy, dietetics, massage and the administration of botanicals and biologicals, but shall not include the administration of narcotics, sulfonamide drugs or powerful physical agents, such as x-ray and radium therapy, or surgery.

Bill Enacted.—H. J. Res. 6 was approved Feb. 4, 1949. It resolves that the House of Representatives go on record as opposing **socialized medicine** in all of its phases and proposes that the House request and urge the Senators and members of the House of Representatives representing Tennessee in the Congress of the United States **to resist** legislation setting up **socialized medicine.**

Texas

Bills Introduced.—H. 588 proposes to require all **applicants** for a **marriage license** to present a certificate from a duly qualified physician licensed to practice *medicine and surgery in Texas or in any state or* territory of the United States stating that the applicant has been given an actual and thorough examination for **syphilis** and that the person examined is free from any infectious condition of that disease. H. 597 proposes to require every physician permitted by law to attend a **pregnant woman** during gestation to take or cause to be taken a sample of the **blood** of such woman at the time of the first examination and to submit same to a laboratory for a standard serologic test for **syphilis.** H. 721 proposes the creation of a Texas board of **chiropractic examiners** and defines a chiropractor as one who shall employ objective or subjective *means without the use of drugs or surgery, for the purpose of* ascertaining the alignment of the vertebrae of the human spine and the practice of adjusting the vertebrae to correct any subluxation or misalignment thereof. H. 760 proposes that corporations furnishing **nonprofit hospital service** or group hospital service shall **not discriminate against** any **hospital** or restrict the right of the **patient** to obtain the services of any licensed doctor of medicine or osteopaths or any other person licensed by the Texas board to practice any branch of the healing arts.

Vermont

Bills Introduced.—H. 338 proposes the enactment of a **hospital licensing** law. H. 376 proposes to require every person licensed to practice **medicine and surgery** to have his **license annually renewed** by the secretary of the state board of medical registration on or before January 31 of each year. Failure to do so would forfeit the right to practice his profession. H. 404 proposes that it shall not be necessary in **malpractice actions** for the **plaintiff** to introduce in **evidence** expert testimony for the purpose of establishing a standard of care and skill for the purpose of showing the failure of the defendant to observe such standard.

West Virginia

Bill Enacted.—S. Con. Res. 9 was adopted March 2, 1949. It provides for the creation of a committee to make a study and **survey concerning** the advisability of the establishment of a four year **school of medicine** and **dentistry** at West Virginia University.

Wisconsin

Bills Introduced.—A. 215, to amend the law relating to chiropodists, proposes to **limit the practice of a chiropodist** by providing that nothing contained in the act shall be construed to permit major surgical operations on the foot, nor minor operations on the foot involving vascular diseases or diabetes except on the advice of one licensed to practice under the medical practice act, nor the treatment of conditions of the feet involving osteomyelitis, malignancies, or syphilis, nor the therapeutic use of x-ray and radium, nor cutting operations involving the bones, ligaments, muscles, nerves or tendons of the feet. A. 472, to amend the law relating to chiropractors, proposes to eliminate the existing provision which requires that at the time of the annual **renewal of the license** the applicant must present satisfactory evidence that he has attended at least one of the two-day educational programs conducted by the **Wisconsin Chiropractic Association.** A. 475 proposes that no person shall conduct a **postmortem examination** of the body of a deceased person unless **licensed** to **practice medicine** and surgery and then only after first obtaining the written consent of the surviving heir who takes possession of the body. S. 504 proposes that no person shall **practice the professions** of law, medicine, dentistry, nursing, chiropractic, accounting or any other profession for which a license is required by the state unless he shall annually file with the Secretary of State an **oath** that he is **not a member** of the **Communist Party.**

Wyoming

Bill Introduced.—S. J. M. 5 proposes to memorialize the Congress of the United States to refrain from imposing upon the citizens of the nation **any form of compulsory health insurance** or any system of medical care designed for national bureaucratic control.

Bill Enacted.—S. 20 has become chapter 48 of the Laws of 1949. It amends the hospital licensing law enacted by the 1948 legislature by requiring the state board of health to submit, biennially, to the legislature a **code of minimum hospital standards** for all hospitals in the state.

GOVERNMENT SERVICES

ARMY

CHANGES IN ARMY MEDICAL AND DENTAL R.O.T.C. SUMMER CAMP PROGRAM

The Surgeon General has announced that changes in the medical and dental reserve officers' training corps summer camp program have been approved by the Department of the Army General Staff. Changes affect only those students who are veterans of one year or more of active military service. They include: (1) use of Army general hospitals instead of the Medical Field Service School for the summer training of qualified persons; (2) the revision of the summer military training program for such persons so as to place primary emphasis on military medicine, dentistry and surgery, and (3) a corresponding reduction in the number of hours devoted to essentially military subjects in that program.

The revisions will not affect those students who are not qualified by a year or more of active military service, As in previous years, they will attend the normal Medical and Dental R.O.T.C. Summer Camp conducted at the Medical Field Service School, Brooke Army Medical Center, Fort Sam Houston, Texas.

Primary reason for the changes was recognition of the fact that veterans of one year or more of active military service are already qualified in most basic military subjects, and their reaction to refresher training in military subjects was not always conducive to the best interests of the program. Under the new changes this condition will be eliminated and these veterans will be free to utilize this training period in a manner more advantageous to both themselves and the service.

Qualified medical and dental students will be sent to selected Army general hospitals for a six week period during the summer instead of to the Medical Field Service School. During this period they will receive orientation in military matters, but the major share of their time will be spent in the wards or dental clinics of the hospitals. They will also attend as many of the regularly scheduled formal teaching exercises as can be integrated into their program. A greater portion of the teaching will be accomplished by the residents, interns and the attending staff assigned to the hospital. With few exceptions the hospitals in which they will undergo this training are at present participating in the programs of nearby medical schools. In addition, a majority of the attending staff physicians and dentists are closely connected with civilian professional schools.

Training periods at the selected general hospitals will be six weeks in length. Two classes will be conducted at each: one beginning June 12 and one beginning August 1. So far as possible, all qualified students at one institution will be sent to the same class at the same installation.

SCRUB TYPHUS RESEARCH UNIT RETURNS TO MALAYA

The Surgeon General's Office announces that the Army Medical Department Scrub Typhus Research Unit has returned to Malaya to continue studies on the effectiveness of the new antibiotic chloromycetin.® The Army research team was invited by the government of the Federation of Malay States and will work at the Institute for Medical Research at Kuala Lumpur with scientists of that institution. The objects of the mission are: (1) to try out on scrub typhus patients a new synthetic chloromycetin® developed by the Parke, Davis Laboratories; (2) to investigate the use of this product for prophylaxis in order to protect troops in typhus areas, and (3) to determine whether the new synthetic is as effective as the natural mold derivative, crystalline chloromycetin,® in the treatment of typhoid.

Chloromycetin® was first reported to the public in October 1947. The preliminary research and subsequent field tests were directed by Dr. Joseph E. Smadel, director of the Department of Virus and Rickettsial Diseases. The results of treatment of cases of typhoid with chloromycetin® were announced in July 1948 and its application to the treatment of spotted fever was described in October 1948. Chloromycetin® is a crystalline substance obtained through the concentration and purification of cultures of a streptomyces. The mold, which was discovered by Dr. Paul R. Burkholder of Yale in a specimen of soil from Venezuela, was referred to Parke, Davis and Company, where the active material from the extract was isolated in crystalline form by Drs. Quentin R. Bartz and John Ehrlich and associates.

VANDERBILT SPONSORS RESERVE HOSPITAL UNIT

The Medical School of Vanderbilt University, Nashville, Tenn., has agreed to sponsor an Army reserve hospital unit made up of personnel in the Nashville area. Following completion of the agreement, military officials participating were guests of the University at a luncheon. Among those present were Chancellor Branscomb of Vanderbilt; Dean Goodpasture of the Medical School; Brig. General Hugh Morgan of the Medical Corps Reserve; Col. Harrison Shull; Col. Beverly Douglas; Lieut. Col. S. W. Hosea of the Tennessee R.O.T.C.; Major Don Crozier, professor of military science and tactics at Vanderbilt; Major Tom F. Little of the Third Army Headquarters, and Major McCleary Nash. During the recent war, Vanderbilt's Medical School sponsored the 300th General Hospital Unit which saw overseas service.

NONMEDICAL OFFICERS TO BE ASSISTANT INSPECTORS

The Surgeon General's Office announces a twelve week course at the Medical Field Service School, Fort Sam Houston, Texas, beginning April 18, to train Medical Service Corps officers as assistant medical inspectors. Officers who satisfactorily complete the course will supervise programs of preventive medicine, including communicable disease control, environmental sanitation, personal hygiene and pertinent phases of sanitary engineering. To qualify, an applicant must be a high school graduate less than 40 years of age, must have completed the officer's basic course or an equivalent and have demonstrated an interest in preventive medicine.

INTERN TRAINING IN CIVILIAN INSTITUTIONS

The following first lieutenants of the Medical Department have been accepted for intern training in hospitals indicated:

Name	Institution
Apel, Otto F.	Saint Luke's Hospital, Cleveland
Cote, Richard H.	Los Angeles County General Hospital
Engles, Leroy L.	Scott and White Hospital, Temple, Texas
Gotteri, Joseph A.	Sacred Heart Hospital
Holt, Prescott B.	Roosevelt Hospital, New York
Ireland, Elwood F., Jr.	Hartford Hospital, Hartford Conn.
LaFlamme, Paul J.	Jersey City Medical Center, N. J.
Mikuta, John J.	University of Pennsylvania Hospital, Philadelphia
Schaffer, Edward V.	New York City Hospital, New York

POSTGRADUATE INSTRUCTION

The following medical officers have been accepted for advanced courses in civilian schools and hospitals:

Name and Rank	Institution	Course
First Lieut. Robert H. Bickford	State University of Iowa Hospitals, Iowa City, Iowa	Residency in medicine
First Lieut. Bela R. Rieger	New Jersey State Hospital, Greystone Park, N. J.	Residency in neuropsychiatry
First Lieut. Campbell A. McNicol	New York City Hospital, Welfare Island, N.Y.	Residency in pathology
First Lieut. John J. Meyerdierks	Jersey City Medical Center, Jersey City, N. J.	Residency in surgery

PUBLIC HEALTH SERVICE

UNITED STATES-CANADIAN CANCER CAMPAIGN

Federal agencies of the United States and Canada jointly are sponsoring an across the border campaign to tell the story of cancer research—what it means, what it has accomplished, what directions it is taking—to the people of both countries.

Dr. John R. Heller, Director of the National Cancer Institute of the Public Health Service, speaking for the United States sponsor, described the program before the opening campaign rally of the American Cancer Society at Constitution Hall, Washington, D. C. In Canada, simultaneous announcement was made by the Honorable Paul Martin, Minister of the Department of National Health and Welfare. A half-hour documentary motion picture, tentatively titled "The Scientist vs. Cancer," was described as the keystone of the new program. A shorter version for popular distribution is contemplated.

Supplementary materials, ranging from study guides for teachers and discussion leaders to booklets for students and lay groups, will be produced by the sponsoring agencies, the National Cancer Institute and the Canadian Department of Health and Welfare. Literature will be distributed in both countries.

This is the first time that the two countries have combined efforts in sponsoring a cancer education program. United States financial support for the project is through a National Cancer Institute grant of $20,000 to the Medical Film Institute in New York City. A similar sum was given by the Department of Health and Welfare in Ottawa to the Canadian National Film Board.

Completion of the film and supporting materials is expected within a year. In this country they will be made available to schools and other interested groups through the Public Health Service and through official and voluntary health agencies.

GRANTS FOR RESEARCH IN NONFEDERAL INSTITUTIONS

Research grants totaling $2,040,900 to finance medical and allied research projects in nonfederal institutions in thirty states, Alaska, Puerto Rico and the District of Columbia, were announced March 17. The grants were awarded following recommendations by the National Advisory Health Council and approval by Surgeon General Leonard A. Scheele of the Public Health Service. The 175 approved projects are designed to provide new scientific data on a variety of human ailments; several are concerned with the use of new drugs; others with the relation of vitamins to human nutrition and susceptibility to respiratory infections; the nature of air-borne infections and their control, and the toxicity of DDT to farm animals and its accumulation in products consumed by man. The projects also include pilot experiments on the effect of variations in the time relationships of insemination and ovulation in determining sex, a study of factors associated with reproductive failure in mammals, and basic research on aging.

The National Advisory Health Council, which recommended the grants, is composed of leaders in the medical sciences, public health and public affairs. The grants program is administered by the National Institutes of Health through the Division of Research Grants and Fellowships.

NATIONWIDE ATTACK ON WATER POLLUTION

President Truman has appointed six nongovernment members of the Water Pollution Control Advisory Board which will assist in controlling the programs and policies authorized by Congress for a nationwide attack on water pollution. The Board will hold its first meeting in the near future to assist in developing support and technical aid in water pollution problems and to provide technical services to state and interstate agencies for tests. The chief responsibility for carrying out provisions of the Water Pollution Act (Public Law 845) rests with the Surgeon General of the Public Health Service, but grants to aid in planning and construction of treatment works will be administered by the Federal Works Agency.

NEW CONSULTANTS TO STUDY SECTIONS OF INSTITUTES OF HEALTH

The Surgeon General has announced the appointment of a new group of consultants in the Study Sections of the National Institutes of Health at Bethesda, Md. They will replace members whose terms expired at the end of 1948. The Study Sections meet periodically to evaluate applications for grants to support medical research projects at nonfederal institutions. Then the applications are submitted to the Advisory Councils of the Public Health Service before being recommended for approval by the Surgeon General. The new consultants and the study sections to which they have been appointed follow:

Consultant	Study Section
Dr. Arthur P. Richardson, Atlanta, Ga	Antibiotics
Dr. Harry H. Gordon, Denver	Antibiotics
Dr. Morris F. Shaffer, New Orleans	Bacteriology
Dr. Charles E. Smith, San Francisco	Bacteriology
Prof. William J. Darby, Nashville, Tenn	Biochemistry and nutrition
Prof. Wendell H. Griffith, Galveston, Texas	Biochemistry and nutrition
Dr. John K. Lewis, San Francisco	Cardiovascular
Dr. George E. Burch, New Orleans	Cardiovascular
Dr. W. C. Stadie, Philadelphia	Cardiovascular
Dr. Allan G. Brodie,	
Dr. Thomas J. Hill,	
Dr. Ernest W. Burge	
Dr. Louis K. Diamon	
Dr. John M. Henderson, New York	Malaria
Dr. George H. Boyd, Athens, Ga	Malaria
Dr. Samuel Soskin, Chicago	Metabolism and endocrinology
Dr. Arthur Grollman, Dallas, Texas	Metabolism and endocrinology
Dr. Douglas H. Sprunt, Kn	
Dr. Russell L. Holman, Ne	
Dr. Carl A. Dragstedt, Eva	
Dr. Harvey B. Haag, Richn	
Dr. Howard B. Lewis, Ann	
Dr. Carl Buck, Ann Arbor.	
Dr. Donald Sheehan, N	
Dr. Simeon T. Cantril,	
Dr. Robert R. Newell,	
Dr. Rolf Eliassen, Ne	
Dr. Harold B. Gotaas,	
Dr. Malcolm H. Merri	
Dr. Asa C. Chandler,	
Dr. P. Morales Otero, San Juan, Puerto Rico	Tropical diseases
Dr. William F. Friedewald, Atlanta, Ga	Virus and rickettsial
Dr. John H. Dingle, Cleveland	Virus and rickettsial

CANCER REGISTRATION

State health departments desiring to set up an active register of living persons with cancer can obtain forms and a manual explaining their use from the National Cancer Institute. A cancer register of this type is a control device that the Cancer Institute and the American Cancer Society hope will be adopted in each state. Report forms are designed to enable a state to obtain prompt and detailed data on the number, location, nature and condition of cases of cancer in the state. The registers would be helpful in measuring control progress, in planning more effective medical and public health procedures, in research, in evaluating results of various types of treatment, in providing special services for patients and in developing an improved follow-up system. The forms were designed by a committee of seven leading statisticians which began work on the project about a year ago.

Following are the types of forms used under the Cancer Register Plan: (1) for the private physician, a card form to expedite quick recording of confidential information on "every case of cancer, suspected cancer or other malignant tumor"; (2) for the hospital or tumor clinic, a letter-sized sheet for complete information on malignant neoplasms and method of treatment; (3) for the pathologist, a letter-sized sheet for complete histologic description of all tumors, and (4) for follow-up of treated cases, a letter-sized sheet to be filled out by hospita or tumor clinic at least once a year for the lifetime of each patient.

Type of examination, condition and location of patient are to be described. Each of the forms is to be dated and signed, and each provides space for the name, age, sex and race of the patient, plus case number and other information that would be helpful in cross referencing.

Requests for forms and help in their use should be addressed to Dr. John R. Heller, Director of the National Cancer Institute, Bethesda, Md.

MORPHOLOGY OF 1949 INFLUENZA

Viruses from the recent epidemic have been studied by Drs. W. J. Elford and I. M. Dawson of the National Institute for Medical Research in collaboration with the World Influenza Centre. Pictures of recently isolated viruses show predominantly long filamentous forms, 0.1 micron or less, in width, but up to 10 microns in length. These are mixed with varying amounts of "orthodox" round and intermediate forms. Long forms in influenza virus preparations were described in 1946 by Mosley and Wyckoff, but were never present regularly or abundantly enough to permit appraisal of their meaning. Now it is possible to study their behavior, and it is learned that their adsorption and elution from red cells are like that expected of influenza virus, and that they can be made visible under the ordinary microscope by dark ground illumination and can by this means be seen to be agglutinated by specific serums. These and other tests, while not conclusive, all indicate that these filaments represent a form of influenza virus. As yet they have been seen only in infected egg fluids or eluates of these. The long forms apparently become scantier on serial passage, especially through mice, and are relatively less numerous in "laboratory" strains of virus.

CHEST ROENTGEN SURVEYS

An eighteen unit roentgen team from the Tuberculosis Division of the U. S. Public Health Service assisted in the recent highly successful Seattle chest roentgen program sponsored by the city, county and state health departments and other local health groups. This team went to Tacoma, Wash., for a survey to be conducted there February 1-26, then on to Spokane, Wash., for another survey in April. A new eighteen unit team will cooperate likewise on a chest roentgen survey in Cleveland from March 9 to the middle of August.

ADDITIONAL INFLUENZA COOPERATING LABORATORIES

The Influenza Information Center of the National Institutes of Health (The Journal, January 8, p. 107) reports the addition of the following cooperating laboratories: Iowa State Hygienic Laboratory, University of Iowa, Iowa City; North Dakota State Department of Health Laboratory, Grand Forks, N. D.; University of Oregon Department of Bacteriology, Portland; Connaught Laboratories at the University of Toronto; Dominion Laboratories of Hygiene at Ottawa, and the Provincial Department of Health for Ontario at Toronto, Canada.

PERSONAL

The appointment of Senior Sanitary Engineer Sylvan C. Martin to head the Great Lakes Drainage Basin Office of the Division of Water Pollution Control at Chicago was announced by Assistant Surgeon General Mark D. Hollis, Chief of Engineering Activities of the Public Health Service, Federal Security Agency.

The Chicago office, located at 225 West Jackson Boulevard, is the third of fourteen proposed river basin offices being established to coordinate the federal water pollution control activities with state, interstate and local agencies as provided in the recently enacted Water Pollution Control Act.

Mr. Martin will work with the states in this basin on the development of a comprehensive program for the abatement of water pollution. This will involve the location of sources of pollution, determination of the most suitable use for the stream and ultimately the determination of water quality standards considering the conservation of waters for public water supplies, propagation of fish and aquatic life, recreational purposes, agricultural, industrial and other legitimate uses.

MISCELLANEOUS

NO CHARGE FOR RADIOISOTOPES FOR RESEARCH

The Atomic Energy Commission announces that it will make available to qualified cancer research workers in the United States without charge all radioisotopes now being sold. The new policy will make available on a free basis the radioisotopes of more than fifty additional elements, notable among which is the radioisotope of cobalt, which promises to become an effective substitute for radium in the treatment of cancer. Two other important cancer research materials that will be available without charge are the radioisotopes of gold and carbon. The new program has been made possible through improvements in the production of isotopes at the Oak Ridge National Laboratory at Tennessee and at the Argonne Laboratory in Chicago.

The free isotopes will be allocated for the following purposes: (1) research programs studying basic cellular metabolism of cancerous cells, (2) cancer investigations involving animal subjects, (3) experimental programs designed to evaluate the therapeutic use of radioactive materials. Applicants for materials must fulfil the requirements of the Atomic Energy Commission and offer assurance that there will be no resale or charges to patients for the isotopes thus procured. Applicants for radioisotopes for use in human beings must be approved by a subcommittee composed of leading physicians. The subcommittee has established the following criteria for the allocation of radioactive materials for human use:

1. The physician using the materials must be associated with a medical institution, hospital or clinic or other medical organization possessing adequate facilities for the proper use of such materials.

2. The use of the materials must meet with the approval of a local isotope committee of the hospital or medical institution with which the physician is associated.

3. Clinical users of radioactive materials must be physicians in good standing with their local medical society and must have had previous clinical experience with radiation or be directly collaborating with persons possessing such experience.

Inquiries from interested investigators should be addressed to the Isotopes Division, U. S. Atomic Energy Commission, Oak Ridge, Tenn.

PANAMA DECORATES ENTOMOLOGIST

The Republic of Panama has conferred its highest award, the Vasco Nunez de Balboa decoration, on James Zetek of the Bureau of Entomology and Plant Quarantine, U. S. Department of Agriculture, in recognition of his work on entomologic and other biologic problems of Panama and the Canal Zone, where he has worked for thirty-eight years. In 1911 he was appointed as entomologist with the old Isthmian Canal Commission. His duties were mostly concerned with the control of malaria, bubonic plague and yellow fever throughout the Canal Zone. While in this position, he discovered a method of determining the flight of malarial mosquitoes. In 1913 he was appointed state entomologist of the Republic of Panama, and later was named Director General of the National Exposition of Panama. In 1920 he was appointed specialist in tropical insects in the Bureau of Entomology, and he has been associated with the Bureau continuously since that time. At present he is in charge of the laboratory of the Bureau of Entomology and Plant Quarantine of the United States Department of Agriculture at Ancon, Canal Zone.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ARIZONA

Annual State Medical Meeting.—The Arizona State Medical Association will hold its annual meeting at the Hotel Pioneer, Tucson, May 8-11 under the presidency of Dr. Harold W. Kohl, Tucson. Out-of-state physicians on the program include:

Irving S. Wright, New York, Use of Anti-Coagulants in Thrombo-Embolic Diseases.
John H. Ebbs, Toronto, Canada, Pediatrics.
Winona G. Campbell, Denver, Diagnosis and Differential Diagnosis of Poliomyelitis.
Willis D. Gatch, Indianapolis, Cholecystitis.
Arthur B. Cecil, Los Angeles, Genital Abnormalities.

The banquet will be held the evening of May 10.

CALIFORNIA

Special Society Election.—The Los Angeles Society of Ophthalmology and Otolaryngology has elected Drs. Warren A. Wilson, president, and Victor Goodhill, secretary-treasurer for the coming year. The society meets the fourth Monday of each month from September to May inclusive at the Los Angeles County Medical Association Building.

Promotions on Medical Faculty.—Stanford University at Stanford has announced promotion of the following members of the medical faculty to professors: Donald J. Gray, Ph.D., and Hadley Kirkman, Ph.D., in the anatomy department; Dr. John K. Lewis in medicine and Dr. Donald E. King in surgery. Dr. Robert H. Dreisbach has been promoted to associate professor in pharmacology and Robert S. Turner, Ph.D., to associate professor of anatomy. Frederick A. Fuhrman, Ph.D., and Dr. Clarence M. Tinsley have been promoted to assistant professors in physiology and medicine, respectively.

CONNECTICUT

State Medical Society Annual Meeting.—The Connecticut State Medical Society will hold its annual meeting at the Teacher's College of Connecticut, New Britain, May 3-5. Visiting speakers at the general program include:

Arthur M. Fishberg, New York, Present Day Treatment of Hypertension.
John A. V. Davies, Boston, Present Day Concepts and Methods of Immunization of Children.
Willard M. Allen, St. Louis, Indications and Dangers in the Uses of Estrogens and Androgens.
William L. Estes Jr., Bethlehem, Pa., Reduction of Mortality in Surgery of the Aged.
Charles A. Flood, New York, Natural History of Peptic Ulcer.
J. William Hinton, New York, Surgical Management of Peptic Ulcer.
Albert J. Sullivan, New Orleans, Personality in Peptic Ulcer.
Edith H. Quimby, Sc.D., New York, Some Uses of Radioactive Isotopes in Medicine.
Edwin B. Astwood, Boston, Treatment of Hypertension with Antithyroid Compounds.
Philip S. Hench, Rochester, Minn., Management of Rheumatoid Arthritis.
Isidore S. Ravdin, Philadelphia, Treatment of Diseases of the Gallbladder and Common Duct.

At a Symposium on Nephritides Thursday afternoon Dr. John P. Merrill, Boston, will speak on "Use of the Artificial Kidney"; Dr. Kendall Emerson Jr., Boston, "Applications of the Artificial Kidney in Medicine," and Dr. J. Hartwell Harrison, Boston, "Management of Renal Insufficiency in Surgery."

At the annual dinner at the Indian Hill Country Club presentation of Fifty Year Membership Awards will be made. The Woman's Auxiliary to the society will meet May 4, at the country club. Besides section meetings of the society, there will be meetings for the state diabetes association, association of medical record librarians and occupational therapy association, and the Association of Medical Examiners, Association of Tumor Clinics and the state chapter of the American Physiotherapy Association.

ILLINOIS

Public Health Physicians Needed.—The Illinois Department of Public Health is in need of public health physicians, for which examinations are to be held May 21. State residence is waived for these applicants. Out-of-state applicants who want to take the written tests outside of Illinois should file this request with their applications well in advance of the closing date, April 30. Physicians are needed to perform professional work under the guidance of a public health physician in state or local public health programs, as well as public health physicians to plan and direct major public health service programs under direction. Salary ranges are from $360 to $460 and $480 to $580, respectively. Applications should be filed with the Illinois Civil Service Commission, 501 Armory Building, Springfield.

Graduate Conference.—A postgraduate conference, arranged by the Illinois State Medical Society, will be held in the Eighth Councilor District April 21 at the Wolford Hotel, Danville, with Dr. Harlan English, Danville, presiding. On the program will be:

Don C. Sutton, Chicago, Use of Anticoagulants in Vascular Disease.
Richard B. Capps, Chicago, Liver Function: Practical and Theoretical Aspects.
Leonard F. Weber, Chicago, Contact Dermatitis (Eczema), illustrated.
Frederick A. Jostes, St. Louis, Some Aspects of the Diagnosis and Treatment of Low Back Pain.
Michael H. Streicher, Chicago, Constipation: Clinical Application in Its Management, illustrated.

At the dinner session, Dr. Eric Oldberg, Chicago, will discuss "Diagnosis and Treatment of Head Injuries." The eighth councilor district comprises the counties of Champaign, Clark, Coles, Crawford, Cumberland, Douglas, Edgar, Jasper, Lawrence, Richland and Vermilion.

Chicago

Section Meeting of Heart Association.—The Clinical Section of the Chicago Heart Association will meet April 20 from 10 a. m. to 12:15 p. m. at St. Luke's Hospital. A series of eight short papers will be presented. All physicians are welcome to attend.

Hektoen Lecture.—The twenty-fifth Ludvig Hektoen Lecture of the Frank Billings Foundation will be delivered at the Palmer House on Friday evening, May 27, by Dr. William B. Wartman, professor and chairman of the department of pathology, Northwestern University Medical School, on "Bleeding into the Arterial Wall; Its Relation to Vascular Disease."

The Irish Memorial Lecture.—Dr. Paul A. O'Leary professor of dermatology and syphilology at the Mayo Foundation for Medical Education and Research, Rochester, Minn., will deliver the third annual Henry E. Irish Memorial Lecture at the University of Illinois College of Medicine on April 27 at 1 p. m. on "Changing Concepts of the Treatment of Syphilis." The lecture was endowed three years ago by Eta Chapter of Alpha Kappa Kappa as a memorial to Dr. Henry E. Irish, late head of the pediatrics department.

Personals.—Dr. Vida A. Latham, a graduate of Northwestern University Woman's Medical School, Chicago, 1895, has been named recipient of the 1949 citation of the Michigan Alumnae Club of Chicago as the outstanding alumna. She received a D.D.S. degree at the University of Michigan, Ann Arbor. Dr. Latham has served as a member of the staff of Northwestern University Woman's Medical School and of the Milwaukee College of Physicians and Surgeons.——Dr. Louis E. Schmidt, who was recently feted at Northwestern University on his eightieth birthday, will retire from active practice April 20 and move to Wausau, Wis.——Dr. Emil H. Grubbe, Chicago, has given his private library, a thousand volume collection dealing with roentgen therapy, to the John Crerar Library.——Dr. Joan Fleming, Chicago, a graduate of the University of Chicago, 1937, has been appointed assistant professor of psychiatry at the University of Illinois College of Medicine. Dr. Fleming was a resident in psychiatry at the Albert Merritt Billings Hospital from 1938 to 1940 and an instructor in psychiatry at the University of Chicago School of Medicine from 1939 to 1943.

Open New Laboratory.—The University of Illinois' new $400,000 Aero Medical and Physical Environment Laboratory, planned to study the effect of physical environment in health and disease, was officially opened April 11. Research programs will be undertaken immediately. Dr. Andrew C. Ivy, vice president of the University of Illinois in charge of the Chicago Professional Colleges, will serve as director. The staff is headed by Dr. John P. Marbarger, research director; Victor Guillemin Jr., Ph.D., biophysicist, and Maurice K. Fahnestock, M.S., engineering director. The building, located in the Medical Center District on Chicago's near West Side, has been under construction since September 1947. The research studies are expected to contribute to basic physiologic knowledge concerning the effect of physical environmental factors on healthy and diseased human beings. The studies also are designed to improve therapeutic procedures in the treatment of certain types of disease and to supplement present knowledge in the field of aviation medicine. Major installations planned for the future include a radiation test laboratory, a constant temperature, humidity and pressure room and a noise and vibration-free room.

KANSAS

Postgraduate Course in Surgery.—The University of Kansas School of Medicine, Lawrence–Kansas City, in cooperation with the Kansas Medical Society and the Kansas State Board of Health, has arranged a postgraduate course in general surgery April 25-27 for doctors in general practice as well as for surgeons of Kansas or adjacent states. In addition to the members of the University of Kansas faculty, guest instructors include Drs. Wayne C. Bartlett, Wichita; Guy A. Caldwell, New Orleans; Reed M. Nesbit, Ann Arbor, Mich., and Dallas B. Phemister, Chicago. The fee is $20. Complimentary enrolment is granted to interns and residents on identification by their hospital superintendents.

KENTUCKY

Regional Blood Center at Louisville.—The Louisville Regional Red Cross Blood Center, which will furnish blood free of charge in Louisville and the surrounding 75 mile area, will open in May at its new headquarters at 1470 South Third Street. Blood donations will be taken, and a supply will be available for those needing the blood. A "bloodmobile" will be operated to procure donations in the 27 surrounding counties participating in the program.

Retiring Dean of Medical School Honored.—At a testimonial dinner at the Louisville Country Club attended by more than two hundred physicians on the teaching staff of the University of Louisville School of Medicine, Dr. John Walker Moore, retiring dean, was the guest of honor. Among the speakers who paid him tribute was Dr. Irvin Abell, past president of the American Medical Association, who enumerated the many honors received by Dr. Moore in his twenty years as dean. Other physicians who gave testimonials on behalf of Dr. Moore were Drs. Guy Aud, former president of the Kentucky State Medical Association, James Bruce, Morris Flexner, R. Glen Spurling, Oscar O. Miller, Joseph C. Bell and H. Hart Hagan, all Louisville physicians. Many concurred in the opinion that Dr. Moore was responsible in great part for the improvement in the Louisville General Hospital and the medical school and its laboratories. Dr. Moore was presented with a television set and an engraved silver plaque commemorating the occasion.

MICHIGAN

Dr. Keane Named Emeritus Professor.—After forty-two years' association with Wayne University College of Medicine, Detroit, Dr. William E. Keane, former professor of urology, has been appointed emeritus professor of urology by the Detroit Board of Education. Dr. Keane, who is now serving as a consultant for Providence Hospital, joined the Wayne faculty in 1902. He has been professor since 1912 and head of the department of urology for seventeen years. Recently the staff of Providence Hospital presented the college of medicine with a portrait of Dr. Keane.

Meeting on Fractures and Other Traumas.—The Genesee County Medical Society and the Flint Regional Committee on Fractures and Other Traumas will present the fifth Annual Fracture and Other Traumas Program the afternoon of May 18 at the Merliss Brown Auditorium in Flint. Speakers on the program, all of Flint, are:

Richard L. Rapport, Practical Applications of the Basic Sciences of the Surgery of Trauma.
Harold W. Woughter, Transportation of the Injured.
Hardie B. Elliott, Receiving and First Aid Procedures.
Donald L. Bishop, Time Factors in Fracture Management.
Stephen M. Gelenger, Thoracic Trauma.
Edwin P. Vary, Abdominal Trauma.
Donald R. Brasie, Open Fractures.
Alvin M. Thompson, Early Recognition of Urological Injuries.
Hira E. Branch, Fractures in Children with Consideration of Seasonal Variations.
Max E. Dodds, Hip Fractures.

At the dinner meeting Mr. Stephen J. Roth, attorney general of Michigan, will speak on "The General Practitioner and His Medico-Legal Responsibilities."

MISSOURI

Society Election.—The Missouri State Medical Association, meeting in March, installed Dr. W. Wallis Smith, Springfield, as president, and chose Drs. William A. Bloom, Fayette, president elect; Harold E. Petersen, St. Joseph, secretary; Charles E. Hyndman, St. Louis, treasurer, and Francis T. H'Doubler, Springfield, as speaker of the house.

NEW JERSEY

State Medical Meeting.—The Medical Society of New Jersey will hold its annual meeting at the Ambassador Hotel, Atlantic City, April 25-28 under the presidency of Dr. J. Howard Hornberger, Roebling. The tentative program, arranged in eighteen individual sections for the entire membership of the society, lists the following out-of-state speakers:

Armand J. Quick, Milwaukee, The Coagulation Mechanism with Reference to Prothrombin.
Lloyd J. Thompson, Winston-Salem, N. C., Psychiatry in Relation to Obstetrics.
Ira S. Ross, Newark, Carbohydrate Metabolism and Cerebral Dysrhythmia, a Clinical Syndrome.
Barton R. Young, Philadelphia, Roentgenological Diagnosis of Gastro-Enterological Diseases.
Currier McEwen, New York, Development of the Campaign Against Rheumatism Abroad and in This Country.
Lester C. Mark, New York, Pre-Anesthetic Preparation in Children.
Frank H. Lahey, Boston, Some Developments in the Management of Thyroid Disease.
Andrew A. Marchetti and Edward B. Tuohy, Washington, D. C., Prevention of Infantile Mortality.
Joseph D. Aronson, Philadelphia, and Edwin R. Levine, Chicago, Symposium on BCG Vaccination for the Control of Tuberculosis.
Hugo Roesler, Philadelphia, Selected Features in the Electrocardiographic Diagnosis of Myocardial Infarction.
Nels A. Nelson, Baltimore, Use and Control of Penicillin.
Bruce Webster, New York, Clinical Results in the Use of Penicillin in the Treatment of Syphilis.
I. Arthur Mirsky, Cincinnati, The Patient with Diabetes Mellitus.
Bradley L. Coley, and Norman L. Higinbotham, New York, Significance of Cartilage in Abnormal Location.
Richard H. Overholt, Brookline, Mass., Second Most Important Silent Lesion.
Glen G. Gibson, Philadelphia, Surgery of the Extraocular Muscles.

NEW MEXICO

State Medical Convention.—The New Mexico Medical Society Convention will be held in Roswell May 5-7. Seven guest speakers will present the scientific papers, covering a variety of specific subjects of much general interest. Each paper will be followed by a discussion led by an association member. The speakers and their specialties are:

J. Mackenzie Brown, Los Angeles, otolaryngology.
M. Edward Davis, Chicago, obstetrics and gynecology.
E. Starr Judd, Rochester, Minn, medicine.
Earl D. McBride, Oklahoma City, orthopedic surgery.
Armand J. Quick, Milwaukee, biochemistry.

The annual banquet will be held Friday night at 8 o'clock. A section program on ophthalmology and otolaryngology will be held Thursday afternoon, Friday and Saturday.

NEW YORK

Four-County Clinic Day.—A clinic teaching day will be conducted April 20 at the Rochester Academy of Medicine under the sponsorship of the Medical Society for the Counties of Genesee, Orleans, Livingston and Wyoming. Four papers will be presented in the morning and afternoon sessions on the subjects of wide interest to general practitioners. Each paper will be followed by discussion.

Spring Teaching Day.—The Chemung County Medical Society, the state medical society and the New York State Department of Health will conduct a Spring Teaching Day at the Mark Twain Hotel, Elmira, April 20, beginning at 2 p. m. The program is as follows:

Lawrence E. Young, Rochester, Differential Diagnosis of Jaundice.
A. Wilbur Duryee, New York, Management of Occlusive Arterial Disease and Phlebitis.
Milton G. Bohrod, Rochester, Use of the Laboratory in Clinical Medicine: A Study in Clinicopathologic Correlation.

At the evening session, the fourth annual Elliott T. Bush Memorial Lecture will be given by Dr. Sidney M. Schaer, Buffalo, on "Blood, Protein and Fluid Balance."

Record Low Death Rate.—The New York State Department of Health reports that a new low death rate of 10.8 per 1,000 population was established in the state in 1948; 157,948 persons' deaths were recorded last year. The 1947 death rate was 11.1. The 1948 birth rate of 20.7 per 1,000 population was the highest in a quarter of a century with the exception of the 1947 rate of 22.8. New low death rates were established last year: for tuberculosis, 35.5 per 100,000 population, a decline of 1.3 for 1947, representing a drop of 1,200 in the number of deaths since 1943 and a decline of 24 per cent in the rate in five years; for influenza, 0.8 per 100,000, half the previous rate set in 1947; for pneumonia, 35.2, a drop from 39.6 in 1947; for chronic nephritis, 39.7, a drop from 42.5.. Streptococcic sore throat, including scarlet fever, took 23 lives compared with 36 in 1947. The chief adverse factor, the health department reported, was the continuous increase in deaths from cirrhosis of the liver. These numbered 2,454 in 1948, setting a death rate of 16.8 per 100,000 persons, the highest since 1912. There were 50 deaths from measles compared with 4 in 1947.

New York City

Brooklyn Psychiatric Society.—The inaugural meeting of the Brooklyn Psychiatric Society, established March 17, will be held April 21, 8:30 p. m. in the auditorium of the Medical Society of the County of Kings. Officers are Dr. Simon Rothenberg, president, and Dr. Morton Hand, secretary-treasurer.

Low Cost Roentgen Examinations.—Experiment.—Low cost chest roentgenograms are now available on Tuesdays and Thursdays at headquarters of the New York Tuberculosis and Health Association, 386 Fourth Avenue (Room 511). The service, available to anyone living or working in Manhattan, the Bronx or on Staten Island, provides roentgenograms for $1. This fee also includes the reading of the roentgenogram and a report to the patient. If preferred, the report may be sent to any designated physician. The service is for an experimental period until May 19.

Center for Psychotherapy.—The Postgraduate Center for Psychotherapy, the training associate of the Institute for Research in Psychotherapy, has been granted a provisional charter from the Board of Regents of the New York State Educational Department. The center offers intensive training for psychiatrists in psychotherapy and also individual courses for general practitioners and nonpsychiatric medical specialists in psychotherapy and psychosomatic medicine. The primary aim of the program is to encourage the development of teams of psychiatrists, psychologists and social workers who can organize and operate community psychiatric clinics. The courses of instruction include practical demonstrations in psychotherapy as well as lectures. Before the psychiatric student completes his training he has had personal experience under supervision in the management of various types of cases. Further information on this program may be obtained by writing to Stephen P. Jewett, M.D., dean, or to Miss Janice Hatcher, registrar, Postgraduate Center for Psychotherapy, Inc., 218 East 70th Street, New York 21.

Personals.—Dr. Mary M. Crawford, medical director for the Federal Reserve Bank of New York, has been appointed a national vice chairman for Cornell University's $12,500,000 Greater Cornell Fund campaign. She is a former president of the Cornell Alumni Association.——Dr. George Baehr, retiring president of the New York Academy of Medicine, has been elected chairman of the board of directors of the Health Insurance Plan of Greater New York, succeeding Dr. Willard C. Rappleye, dean of the Columbia University College of Physicians and Surgeons.——Dr. Condict W. Cutler Jr., director of surgery at the Goldwater Memorial Hospital on Welfare Island, has been elected a trustee of Columbia University.——Dr. Emanuel D. Friedman was a guest of honor at the annual dinner of the Alumni of New York University College of Medicine on February 21 on completion of forty years of continuous teaching at his alma mater.——Dr. Frank E. Adair, Memorial Hospital for the Treatment of Cancer and Allied Diseases, will deliver the Lord Moynihan Lecture in London before the Royal College of Surgeons on March 23, on "Surgical Problems Involving Cancer of the Breast."

TEXAS

Annual Meeting of State Medical Association.—The State Medical Association of Texas will hold its annual meeting in San Antonio May 2-5 with registration headquarters at the Municipal Auditorium. Guest speakers at the general meetings include:

William L. Pressly, Due West, S. C., The Human Side of Medicine.
Willis E. Brown, Little Rock, Ark., Cytologic Technique in the Diagnosis of Uterine Cancer.
Lauren V. Ackerman, St. Louis, Responsibility of the Pathologist in the Diagnosis and Treatment of Cancer.
W. Paul Holbrook, Tucson, Ariz., Problem of Arthritis and Rheumatism.
Gaylord W. Anderson, Minneapolis, Certain Epidemiologic Concepts of Poliomyelitis.
Archibald L. Hoyne, Chicago, Modern Treatment of Meningitis.
John S. Harter, Louisville, Ky., Bronchiectasis.
Cecil Striker, Cincinnati, Diabetes Mellitus—An Orientation.
Samuel F. Marshall, Boston, Surgical Treatment of Peptic Ulcer.
Byrl R. Kirklin, Rochester, Minn., Diaphragmatic Hernia.
Charles I. Johnson, Boston, Intracranial Complications of Otogenic and Rhinogenic Disease.

Section meetings will be held in general practice; medicine and pediatrics; surgery; obstetrics and gynecology; eye, ear, nose and throat; radiology and physical medicine; public health, and pathology. Both scientific and technical exhibits and motion pictures will be shown. Clinical luncheons will be held Wednesday and Thursday, and the President's Reception and Ball will take place Tuesday night. The Woman's Auxiliary will have headquarters at the Menger Hotel. Numerous state medical organizations will hold meetings in conjunction with the state medical association, and alumni and fraternities have scheduled banquets.

UTAH

Cancer Symposium.—The Cancer Teaching Program of the University of Utah College of Medicine, Salt Lake City, and the Bureau of Cancer Control of the State Department of Health will present the Second Annual Cancer Symposium April 25-27. Guest speakers will include Drs. George T. Pack, New York; Charles E. McLennan and Henry S. Kaplan, San Francisco; Rulon W. Rawson, New York, and Howard L. Richarson, Portland, Ore.

WEST VIRGINIA

Meeting of Academy of Ophthalmology and Otolaryngology.—The second annual meeting of the West Virginia Academy of Ophthalmology and Otolaryngology will be held May 13-14 at the Shenandoah Hotel in Martinsburg. Speakers on the scientific program are as follows:

Glen G. Gibson, Philadelphia, Medical and Neurological Ophthalmology.
G. Slaughter Fitz-Hugh, Charlottesville, Facio Maxillary Fractures.
Walter O. Klingman, Charlottesville, Headaches.
Charles T. St. Clair, Bluefield, Allergic Manifestations in the Eye.
James K. Stewart, Wheeling, Experiences with Penicillin in Acute Otitis Media.

The film "Integrated Orbital Implant" will be shown. The annual banquet will be held at the Shenandoah Hotel.

Open Meeting on Health Insurance.—Dr. George F. Lull, Secretary and General Manager of the American Medical Association, Chicago, will be guest speaker at an open meeting in Charleston, April 27, sponsored by the Woman's Auxiliary to the Kanawha Medical Society. His topic will be "What Compulsory Health Insurance Means to the People." The meeting, which will be held at the Daniel Boone Hotel, is expected to draw an attendance in excess of 300 representatives of local civic, service and welfare organizations, as well as representatives of many other professions and businesses and manufacturing organizations in the Kanawha Valley. A round table discussion of the proposed federal compulsory health insurance plan, led by Dr. Lull, will follow the speaking program. The spring meeting of the Auxiliary to the West Virginia State Medical Association has been called for the same day, and it is expected that all county auxiliaries will be represented at the luncheon.

GENERAL

Dr. Spencer to Direct Kress Foundation.—Herbert L. Spencer, Ph.D., president of Bucknell University, Lewisburg, Pa., has resigned to become executive director on July 1 of the Samuel H. Kress Foundation, New York. The Kress Foundation was established in 1929 to "promote the moral, physical and mental welfare, and progress of the human race." In January it gave $8,000,000 to the projected New York University-Bellevue Medical Center (THE JOURNAL, January 29, page 319).

Meetings on Mental Deficiency.—The American Association on Mental Deficiency and the first Pan-American Congress will meet at the Roosevelt Hotel, New Orleans, April 26-30, under the presidency of Dr. Edward J. Humphreys, Trenton, N. J. Section meetings will be held on education, general research and reports, state programs for care and supervision of the mentally deficient, present status and future in the fields of mental deficiency, medicine and psychiatry, education and administration.

Rehabilitation Convention.—The Association for Physical and Mental Rehabilitation will hold its annual convention at the Hotel New Yorker, New York, May 18-21. More than 500 representatives from the nation's Veterans Administration, army, navy and civilian rehabilitation agencies will be present. Mr. Leo Berner, chief corrective therapist of the Bronx veterans hospital, is chairman for the convention. For further information, address H. S. Wettstein, Corrective Therapy Section, Veterans Administration Hospital, Bronx, New York.

Program for Epileptic Children.—Educational and medical programs planned to meet the individual needs of the child with epilepsy and to fit the resources of the community were recommended by the International Council for Exceptional Children at its twenty-seventh annual meeting held in San Francisco, Feb. 27-March 2. A special committee on epilepsy, which met twice last year, will be enlarged this year to carry on a program of public education about epilepsy in order that the attitude of parents of "normal" children will not limit educational opportunities for epileptic children. New organizations to be represented on the committee are the Parent-Teachers Association, the National Rehabilitation Association and the National Association of State Directors of Elementary Education. The council commended the American Epilepsy League for its assistance and cooperation in making the meetings of the special committee possible.

Annual Meeting of Psychosomatic Society.—The American Psychosomatic Society will hold its annual meeting April 30 and May 1 at the Chalfonte-Haddon Hall at Atlantic City under the presidency of Dr. Leon J. Saul, Philadelphia. The program, arranged under the chairmanship of Dr. Roy R. Grinker, Chicago, includes papers on "Emotional Factors in the Precipitation of Diabetic Acidosis" by Drs. Harold Rosen and Theodore Lidz of Baltimore; "The Role of the Unconscious in Gastric Physiology; Experimental Observations" by five physicians from Mount Sinai Hospital, New York, and "Treatment of Psychosomatic Disorders by Nonpsychiatric Physicians" by a group of physicians from the University of Cincinnati. A panel discussion on "The Psychosomatic Aspects of Hypertension" will be held under the chairmanship of Dr. Carl A. Binger, New York. Discussion by one or more physicians will follow presentation of each paper or group of papers.

National Survey to Establish Incidence of Multiple Sclerosis.—The National Multiple Sclerosis Society is conducting a nationwide fact-finding program aimed at obtaining figures on the incidence of multiple sclerosis. The first project was a statistical survey in the city of New Orleans and vicinity conducted on a grant made by the society to Tulane University. The survey has been completed and results are now being tabulated and evaluated. Similar projects are under way in the San Francisco and Denver areas supported by grants made to Stanford University and the University of Colorado. Parallel surveys in cooperation with the U. S. Public Health Service are planned for Minneapolis and Boston, all to be completed this year. It is expected that the survey results will allow a reasonably accurate estimate of the number of multiple sclerosis cases in the United States.

College of Physicians Awards.—The American College of Physicians, meeting in New York March 28-April 1, presented the following awards, in addition to the James D. Bruce Memorial Award (The Journal, April 9, p. 1014). The John Phillips Memorial Award was given to Dr. Edwin B. Astwood, research professor of medicine at Tufts College Medical School, Boston, for developing "new ways to curb the hyperactive thyroid" and stimulating "a fresh search for the treatment of exophthalmic goiter by medical rather than by surgical means." The Alfred Stengel Memorial Award was given to Dr. James J. Waring, professor of medicine at the University of Colorado School of Medicine, Denver, in recognition "not only of loyalty and service to the college, but also of outstanding influence in the advancement of medical education, practice and research, in the perpetuation of the history and traditions of medicine and medical ethics and in the maintenance of the dignity and efficiency of internal medicine in its relation to public welfare."

Program of International Congress on Rheumatic Diseases.—More than 150 physicians from foreign countries are expected at the International Congress on Rheumatic Diseases to be held at the Waldorf-Astoria, New York, May 30 to June 3. Papers will be presented in the mornings, and afternoon clinics will be held at several of the New York hospitals. Papers have been accepted from the following foreign speakers:

Lord Horder, London, Rheumatism, a National Problem.

Jacques Forestier, Aix-les-Bains, France, Treatment of Progressive Rheumatism with Copper Salts.

Eric Jonsson, Stockholm, Relations between Rheumatic Fever and Rheumatoid Arthritis.

Imre Barsi-Basch, Budapest, Transfusions of Blood from Pregnant Women in Patients with Rheumatoid Arthritis.

Prof. S. de Seze, Paris, Procaine Infiltration in Painful Musculoskeletal Disorders.

Svend Clemmesen, Copenhagen, Statistical Analysis of 1000 Cases of Rheumatoid Arthritis in Relation to Insidious and Acute Onset, Menopause, Pregnancy, Psoriasis, Ankylosing Spondylitis and Still's Disease.

William Tegner, London, Some Aspects of Psychogenic Rheumatism.

Henrik Seyfarth, Oslo, Muscle Soreness and Myosis as a Symptom of Chronic Overstraining, Especially in Neurotics.

P. Barcelo, Barcelona, Spain, Chronic Polyarthritis and Psoriasis.

Veikko Laine, Heinolan, Finland, Involvement of the Nervous System in Rheumatoid Arthritis.

Fernando H. Ramos, Montevideo, Periarthritis of the Shoulder.

Official languages of the congress will be English, French and Spanish, but instantaneous translations of the scientific papers at the plenary sessions will be made by I. B. M. wireless system. The meeting is open and the registration fee is $10.

Regional Conferences on Local Health Units.—The National Advisory Committee on Local Health Units of the National Health Council has planned the third and fourth in a series of regional conferences on local health units. The two conferences currently planned are one in Kansas City, Mo., April 20-21, to include Arkansas, Kansas, Louisiana, Missouri and Oklahoma and a second in Omaha, Neb., April 25-27, to include Iowa, Minnesota, Nebraska, North Dakota and South Dakota. The conferences will feature group discussions and group decisions as in the case of two earlier conferences in Mitchell, Ind., and Salt Lake City. State teams of ten to fifteen persons, representing a cross section of lay and professional interest in the development of more adequate local health services, will be selected by the respective state health officers. Resource persons for the conferences will be furnished by such national agencies as the American Heart Association and the American Public Health Association, in addition to the National Health Council. The primary purpose of the national conferences that have been held or planned is to extend coverage by local full time protective health services to every person in the United States and to increase the quality of existing services.

Joint Annual Meetings of Tuberculosis Societies.—The National Tuberculosis Association, the American Trudeau Society and the National Conference of Tuberculosis Secretaries will hold joint annual meetings at the Hotel Book-Cadillac, Detroit, May 2-6. Several panel discussions and symposiums are included in the program:

MEDICAL SECTION

Streptomycin and Tuberculosis, Dumont Clark, Denver, chairman.

Symposium on Extrapulmonary Tuberculosis, John K. Lattimer, New York, and others.

Laboratory and Research, Guy P. Youmans, Chicago, chairman.

Non-Tuberculosis Diseases, Paul H. Holinger, Chicago, chairman.

Symposium on Segmental Bronchopulmonary Anatomy, Chevalier L. Jackson, Philadelphia, and Edward M. Kent, Pittsburgh.

Surgery, Paul C. Samson, Oakland, Calif., chairman.

PUBLIC HEALTH SECTION

Analysis and Evaluation of a Tuberculosis Control Program, Ira V. Hiscock, Sc.D., New Haven, Conn., chairman.

Tuberculosis Leadership in Health Education—*Can It Be Maintained?* Iago Galdston, New York, chairman.

Spotlighting the Patient and His Family, N. Stanley Lincoln, Ithaca, N. Y., chairman.

Basic Community Organization, James W. Parker, Detroit, chairman.

The presidential addresses will be delivered Tuesday evening by Dr. Herbert L. Mantz, Kansas City, Mo., of the National Tuberculosis Association; Dr. H. Corwin Hinshaw, Rochester, Minn., of the American Trudeau Society, and Charles Kurtzhalz, Philadelphia, of the National Conference of Tuberculosis Secretaries.

FOREIGN

French Congress of Gynecology.—The thirteenth French Congress of Gynecology will be held in Biarritz June 7-11 under the presidency of Dr. Marcel Senechal of Paris. Among the speakers will be Drs. Andre Binet, professor of gynecology of the Faculty of Nancy; Raoul Palmer and Paul Ulrich, both of Paris. Membership fees have been reduced to 1,000 francs. Registration must be made before May 1 to the treasurer, Dr. A. Guillemin, 21 Avenue d'Eylau, Paris-XVI^{me}.

At the close of the French congress the society will organize an International Congress of Gynecology to meet in Paris June 23-27, 1951. At this meeting a series of conferences will be held by the eminent gynecologists of various nations who will discuss gynecologic diagnosis and therapy. General secretary in charge of scientific papers will be Dr. Claude Beclére of Paris; general secretary in charge of organization of the congress will be Dr. Maurice Fabre of Paris. Address all inquiries to Dr. Maurice Fabre 1, rue Jules-Lefebvre, Paris (IX).

Marriages

Harry Albert Hanson, Albert Lea, Minn., to Miss Dorothy Harriet Williams in Rochester, N. Y., February 5.

John William Baird, Henderson, Tenn., to Miss Florence De Luca of Greenwich, Conn., in Boston, February 7.

Ralph Woodworth Haswell, Newport News, Va., to Miss Ruth Edna Emery in Williamson, N. Y., December 31.

Robert E. Nelson, Brooklyn, to Miss Mary E. Rostzinko of Bangor, Me., in Merrick, N. Y., February 26.

Edgar Louis Lipton, West Los Angeles, Calif., to Miss Marie Lucile Belk of Goldsboro, N. C., February 19.

Robert Leon Williams, Albany, N. Y., to Miss Shirley Glenn Miller of Warrensburg, February 5.

Thomas Henry Mercer Jr., Oak Park, Ill., to Dr. Jeanne Emily Kehoe, Chicago, February 12.

Max J. Fischer to Mrs. Joan Kaufman Nathan, both of Washington, D. C., February 24.

Lyman B. Hollingsworth, Boise, Idaho, to Mrs. Barbara Butler of Seattle, February 26.

Aaron Weisberg, Brooklyn, to Miss Ruth Mintz of Boston, February 5.

Deaths

Gilbert Cottam ⊕ Pierre, S. D.; born in Manchester, England, Aug. 2, 1873; Marion-Sims College of Medicine, St. Louis, 1893; from 1943 to July 1948 superintendent of the South Dakota State Board of Health; member of the House of Delegates of the American Medical Association in 1924; past president of the South Dakota State Medical Association and the Sioux Valley Medical Association; member of the Western Surgical Association, Minneapolis Surgical Society, Minnesota Pathological Society and the American Trudeau Society; fellow of the American College of Surgeons; member of the founders group of the American Board of Surgery; served overseas during World War I; formerly on the staffs of McKennan and Sioux Valley hospitals in Sioux Falls; served as editor of the *Bulletin of the Hennepin County (Minn.) Medical Society,* on the editorial board of the *Journal Lancet* and as associate editor of *Minnesota Medicine;* died March 4, aged 75, of terminal pneumonia and chronic myocarditis.

John Lucius McGehee ⊕ Memphis, Tenn.; born in Como, Miss., Jan. 2, 1879; Memphis (Tenn.) Hospital Medical College, 1901; formerly professor of surgery at the University of Tennessee College of Medicine; member of the founders group of the American Board of Surgery; past vice president of the Southern Surgical Association; member of the Southeastern Surgical Congress; fellow of the American College of Surgeons; served during World War I; on the staffs of John Gaston Hospital and Baptist Hospital, where he died February 16, aged 70, of acute pulmonary edema, bronchial asthma and chronic emphysema.

Philip Ray Appel ⊕ Detroit; Detroit College of Medicine and Surgery, 1934; died February 8, aged 39, of coronary thrombosis.

Leo Awotin ⊕ Chicago; Indiana University School of Medicine, Indianapolis, 1916; died February 11, aged 73, of arteriosclerosis and coronary occlusion.

Lewis Warner Beery, Canal Winchester, Ohio; Long Island College Hospital, Brooklyn, 1878; president of the Peoples Bank; died in the Grant Hospital, Columbus, January 24, aged 97, of nephritis.

Cleo D. Bell ⊕ Pittsburg, Kan.; University of Kansas School of Medicine, Kansas City, Kan., 1931; member of the American Society of Anesthetists; served overseas during World War II; affiliated with Mount Carmel Hospital; died January 16, aged 45, of heart disease.

Oswin W. Berky, Bally, Pa.; Medico-Chirurgical College of Philadelphia, 1901; served as burgess, postmaster, bank director and school director; affiliated with the Sacred Heart Hospital, Allentown; died in the Allentown Hospital January 16, aged 73, of hypostatic pulmonary edema.

Frances Sage Bradley, Washington, D. C.; Cornell University Medical College, New York, 1899; during World War I established a children's bureau in France under the supervision of the American Red Cross; formerly a special agent for the U. S. Children's Bureau, serving as director of the bureau of child hygiene of the Arkansas State Board of Health; served as director of the child welfare division of the State Board of Health of Montana; died February 11, aged 82, of uremia.

Russell George Brando, Detroit; Detroit College of Medicine and Surgery, 1927; member of the American Medical Association; died January 3, aged 49, of coronary disease.

Charles Percy Brown, El Paso, Texas; Rush Medical College, Chicago, 1902; member of the American Medical Association; for two years secretary of the Southwestern Medical Association; served during World War I; died recently, aged 73, of arteriosclerosis.

Leroy Capehart, Chattanooga, Tenn.; University of West Tennessee College of Medicine and Surgery, Memphis, 1918; died in the Collins Chapel Connectional Hospital, Memphis, January 23, aged 55, of uremia.

Thomas Joseph Carney ⊕ Alma, Mich.; Long Island College Hospital, Brooklyn, 1898; fellow of the American College of Surgeons; part owner of the Carney-Wilcox-Miller Hospital; formerly mayor of Alma; died January 3, aged 79, of arteriosclerotic heart disease and cerebral hemorrhage with left hemiplegia.

William T. Collum, Red Bay, Ala.; Memphis (Tenn.) Hospital Medical College, 1905; died in North Mississippi Community Hospital, Tupelo, Miss., January 14, aged 71.

William Duncan Crosby ⊕ Louisville, Ky.; University of Louisville School of Medicine, 1938; member of the Southeastern Surgical Congress; fellow of the American College of Surgeons; associate in surgery at his alma mater; served overseas during World War II; on the the staffs of Norton Memorial Infirmary, Kentucky Baptist Hospital and St. Joseph's Infirmary; died January 11, aged 35, of coronary occlusion.

Edward Cussler ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1904; assistant professor of clinical medicine at Cornell University Medical College; affiliated with the New York Hospital-Westchester Division in White Plains and the New York Hospital; served in France during World War I; died suddenly, February 2, aged 66, of coronary thrombosis.

William Everts Downing, Clovis, Calif.; Cooper Medical College, San Francisco, 1903; died January 28, aged 68.

Frederick Arthur Drake, Lanesboro, Minn.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1896; member of the American Medical Association; formerly mayor of the village, on the school board and village health officer; died January 31, aged 78, of coronary occlusion.

Howard Justin Driscoll, Philadelphia; Hahnemann Medical College and Hospital of Philadelphia, 1931; served during World War II; affiliated with Fitzgerald Mercy Hospital, Darby; died January 26, aged 43, of coronary occlusion.

Thomas Balfour Dunn ⊕ Berkeley, Calif.; University of California Medical School, San Francisco, 1916; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; at one time an officer in the regular navy; lecturer in tropical medicine at the University of California Medical School; served on the staffs of the Samuel Merritt, Peralta and Providence hospitals in Oakland; died in Fresno, December 28, aged 62.

Dwight Molyneaux Ervin, San Francisco; University of Cincinnati College of Medicine, 1917; died in Southern Pacific Hospital January 12, aged 63, of glioblastoma.

Orris Orville Force, Monrovia, Calif.; Northwestern University Medical School, Chicago, 1901; died January 29, aged 85, of cerebral thrombosis.

Herbert Lentz Freeland ⊕ Lieutenant Colonel, U. S. Army, retired, Pasadena, Calif.; St. Louis University School of Medicine, 1906; served during World War I; entered the medical corps of the U. S. Army in 1917 as a first lieutenant; promoted through the various grades to that of lieutenant colonel in 1937; retired on July 30, 1940 for disability in line of duty; died January 11, aged 72, of heart disease.

Leo William Fulton Jr., Beggs, Okla.; St. Louis University School of Medicine, 1906; died December 4, aged 66.

Charles Joseph Carroll Gillon ⊕ Taunton, Mass.; Harvard Medical School, Boston, 1915; served during World War I; on the staffs of the Morton and Taunton State hospitals; died January 15, aged 59, of cerebral hemorrhage.

John Douglas Graham, Devils Lake, N. D.; University of Toronto Faculty of Medicine, Toronto, Canada, 1923; member of the American Medical Association; member of the board of education; affiliated with Mercy Hospital, where he died January 26, aged 47, of cerebral thrombosis and myocardial infarction.

John Francis Grant ⊕ Long Beach, Calif.; Northwestern University Medical School, Chicago, 1917; affiliated with Community Hospital and Seaside Memorial Hospital, where he died January 18, aged 57, of coronary thrombosis and uremia.

David Eugene Harriman, York Village, Me.; University of Vermont College of Medicine, Burlington, 1898; member of the American Medeical Association and the Massachusetts Medical Society; died January 18, aged 74, of coronary disease.

Charles Bonnell Hatfield, Bloomdale, Ohio; Kentucky School of Medicine, Louisville, 1893; died January 12, aged 87, of heart disease.

George Roberts Hetrich, Birdsboro, Pa.; Jefferson Medical College of Philadelphia, 1923; member of the American Medical Association; affiliated with St. Joseph's and Reading hospitals in Reading; died January 25, aged 55, of bronchogenic carcinoma of the lungs.

Henry Hulst, Grand Rapids, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1888; specialist certified by the American Board of Radiology, Inc.; member of the American Roentgen Ray Society, of which he had been past president, and the American College of Radiology; died January 2, aged 89, of cerebral thrombosis.

Frank Hyde, Eminence, Mo.; Marion-Sims College of Medicine, St. Louis, 1895; member of the American Medical Association; president of the Carter-Shannon Counties Medical Society; served as mayor, and as president of the school board; died in Poplar Bluff (Mo.) Hospital January 9, aged 77, of coronary embolism.

William Thomas Johnson, Corvallis, Ore.; St. Louis University School of Medicine, 1907; member of the American Medical Association; past president of the Oregon State Medical Society; served as city and county health officer, mayor and state representative; on the staff of the Good Samaritan Hospital; died in Waldport, December 19, aged 72, of coronary occlusion.

Robert Joseph Kearns, Spokane, Wash.; Northwestern University Medical School, Chicago, 1903; member of the American Medical Association: died in the Sacred Heart Hospital January 1, aged 73, of cerebral hemorrhage.

Ralph Burnsell Kettlewell, Sauk Centre, Minn.; University of Minnesota Medical School, Minneapolis, 1932; member of the American Medical Association; served during World War II; died in the Abbott Hospital, Minneapolis, January 1, aged 45, of coronary thrombosis.

Donald H. Leeper, Hiddenite, N. C.; North Carolina Medical College, Charlotte, 1906; died in the Davis Hospital, Statesville, January 19, aged 69, of cancer of the colon.

Leonard Warren Levine ⊕ Ellington, Conn.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1937; past president of the Tolland County Medical Society; county jail physician; died in the Rockville (Conn.) City Hospital January 2, aged 35, of coronary thrombosis.

Francis H. Liesen, Quincy, Ill.; Fort Wayne (Ind.) College of Medicine, 1897; died in St. Mary's Hospital January 18, aged 77, of anthrax and myocardial infarct.

Robert Clarence Lowry, Boyle, Miss. (licensed in Mississippi in 1907); member of the American Medical Association; died January 12, aged 68, of thrombosis.

Edward Ames Lyon, Chicago; Rush Medical College, Chicago, 1896; died January 10, aged 77, of coronary thrombosis.

Alexander Edwin McCornack ⊕ Elgin, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1911; affiliated with St. Joseph's Hospital and the Sherman Hospital, where he died January 26, aged 63, of coronary artery disease.

John McIntyre, Chicago; Jenner Medical College, Chicago, 1913; died in Cook County Hospital January 15, aged 92, of carcinoma of the palate.

Howard James Maldeis, Baltimore; University of Maryland School of Medicine, Baltimore, 1903; member of the American Medical Association; associate professor of medical jurisprudence at his alma mater; specialist certified by the American Board of Pathology, Inc.; member of the American Society of Clinical Pathologists; chief medical examiner of Maryland; affiliated with St. Joseph's Hospital, Franklin Square Hospital and University Hospital, where he died January 15, aged 69, of carcinoma of the pancreas.

Frank Lloyd Matson, Wellsburg, W. Va.; University of Louisville (Ky.) Medical Department, 1906; member of the American Medical Association; secretary of the Brook County Medical Society; died January 2, aged 70, of coronary thrombosis.

Louis Morgan Mooney ⊕ New York; University and Bellevue Hospital Medical College, New York, 1899; served on the staffs of Polyclinic, St. Elizabeth and Misericordia hospitals; died January 19, aged 88, of arteriosclerosis.

Myron Brill Morris, Staten Island, N. Y.; Syracuse University College of Medicine, 1904; affiliated with St. Vincent's Hospital, where he died January 4, aged 68, of generalized arteriosclerosis.

William Atwood Mowry ⊕ Madison, Wis.; Northwestern University Medical School, Chicago, 1910; clinical professor of medicine at the University of Wisconsin Medical School; specialist certified by the American Board of Internal Medicine; past president of the Chicago Society of Allergy; affiliated with the State of Wisconsin General Hospital; died January 8, aged 68, of hypertension and arteriosclerotic heart disease.

William V. Nelson ⊕ Milwaukee; Milwaukee Medical College, 1905; formerly secretary of the Milwaukee County Medical Society; served on the staff of St. Luke's Hospital; died January 14, aged 68, of coronary thrombosis.

Michael J. Nestor ⊕ Providence, R. I.; College of Physicians and Surgeons, Baltimore, 1905; past president and treasurer of the Rhode Island Public Health Association; city registrar and superintendent of the city health department for many years; served on the staffs of the Rhode Island Hospital, St. Joseph's Hospital and Providence Lying-In Hospital; member of the American Public Health Association; died in the Charles V. Chapin Hospital January 9, aged 72, of cerebral hemorrhage.

Clarence Willard Olson, Arcadia, Fla.; University of Illinois College of Medicine, Chicago, 1917; resident physician at the Florida State Hospital; died January 14, aged 54, of coronary occlusion, diabetes mellitus, pneumonia and fracture of clavicle and ribs due to an automobile accident.

Michael Francis O'Shea, Staten Island, N. Y.; Bellevue Hospital Medical College, New York, 1898; died January 1, aged 77.

Orlando Francis Partridge, Mattoon, Wis.; Milwaukee Medical College, 1896; member of the American Medical Association; died in Shawano, December 29, aged 76, of chronic myocarditis with decompensation.

Albert Edward Peart, St. Louis; St. Louis College of Physicians and Surgeons, 1910; died in the City Hospital January 21, aged 76.

Clarence Eugene Peery ⊕ Majestic, Ky.; Loyola University School of Medicine, Chicago, 1918; died in McMinnville, Tenn., February 2, aged 57, of intestinal obstruction.

John Ralph Pinion, Caruthersville, Mo.; University of Missouri School of Medicine, Columbia, 1909; member of the American Medical Association; died January 12, aged 60, of coronary thrombosis following operation for appendicitis.

Alfred Carlyle Prentice ⊕ Endicott, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1901; member of the House of Delegates of the American Medical Association in 1920; at various times affiliated with Wilson Memorial Hospital, Johnson City, Vanderbilt Clinic, French Hospital, Erlanger Home for Crippled Children and the Baptist Home for the Aged in New York; on the staff of the Ideal Hospital; died in Packer Hospital, Sayre, Pa.; January 13, aged 73, of acute pulmonary edema.

Leonard Eugene Ragsdale, Williamsport, Tenn.; Bellevue Hospital Medical College, New York, 1897; member of the American Medical Association; past president of the Middle Tennessee Medical Society and the Maury County Medical Society; formerly superintendent of the Tennessee Home for Feebleminded and the Central State Hospital in Nashville; died January 23, aged 73.

Michael Napoleon Ratzan, Brooklyn; Medico-Chirurgical College of Philadelphia, 1906; affiliated with the Unity, Crown Heights and Williamsburg hospitals; died January 20, aged 67, of pulmonary embolus.

Eduard Cecil Reynolds, Independence, Kan.; Bennett Medical College, Chicago, 1907; died suddenly, January 10, aged 72, of coronary occlusion.

George Nelson Richmond, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1895; member of the American Medical Association; affiliated with Presbyterian and University of Pennsylvania hospitals; died January 9, aged 79, of diabetes mellitus.

Herbert Ewing Riddel, Sarasota, Fla.; Hahnemann Medical College and Hospital of Philadelphia, 1898; served during World War I and was awarded the Purple Heart; died January 4, aged 74, of abdominal aneurysm.

Joseph Franklin Roe, Binghamton, N. Y.; Cleveland Medical College, 1894; formerly member of the city planning commission and the board of managers of the City Hospital; died January 8, aged 77, of coronary thrombosis.

Abraham H. Salzberg, Brooklyn; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1922; specialist certified by the American Board of Obstetrics and Gynecology; member of the American Medical Association; fellow of the American College of Surgeons; on the staff of Jewish Hospital; died February 4, aged 51, of coronary occlusion.

David Gentner Sampson ⊕ Lisbon, N. D.; Kansas City (Mo.) Hahnemann Medical College, 1914; served during World War I; for many years district physician at Pedro Miguel, Canal Zone; died January 13, aged 57, of coronary thrombosis.

Frank E. Selover, Saginaw, Ore.; University of Oregon Medical School, Portland, 1897; died January 4, aged 76, of arteriosclerosis and bronchopneumonia.

Robert George Shaw, Detroit; Detroit College of Medicine, 1907; member of the American Medical Association; member of the staff of St. Mary's Hospital, where he died January 20, aged 82, of generalized arteriosclerosis.

Harold Koch Shawan ⊕ Detroit; Western Reserve University Medical Department, Cleveland, 1909; fellow of the American College of Surgeons; professor of clinical surgery at the Wayne University College of Medicine; specialist certified by the American Board of Surgery; affiliated with Grace Hospital, City of Detroit Receiving Hospital, Highland Park (Mich.) Hospital and the St. Francis Hospital in Hamtramck; died January 11, aged 65, of acute coronary thrombosis.

William Reynolds·Shetterly, Brooklyn; Medical College of Ohio, Cincinnati, 1890; member of the American Medical Association; consultant at Lutheran Hospital; formerly on the staffs of the Brooklyn and Brooklyn Eye and Ear hospitals; died in Long Island College Hospital January 7, aged 86, of cerebral thrombosis.

Eugene Wesley Shrader, Moberly, Mo.; Missouri Medical College, St. Louis, 1895; for many years president and secretary of the Randolph County Medical Society; served during World War I and as draft medical examiner during World War II; for two terms county coroner; died January 14, aged 75, of cardiorenal insufficiency and arteriosclerosis.

John Gabrile Siddens, Morgantown, Ky.; Barnes Medical College, St. Louis, 1902; served during World War I; died in the City Hospital, Bowling Green, Ky., January 9, aged 76, of pneumonia.

Lewis Franklin Siegler, Philadelphia; Jefferson Medical College of Philadelphia, 1886; formerly health officer of Lancaster, Pa.; died January 29, aged 82, of bronchopneumonia.

Maurice Silverman ⊕ Philadelphia; Jefferson Medical College of Philadelphia, 1924; certified by the National Board of Medical Examiners; served during World War II; died January 20, aged 48, of lymphosarcoma of the spleen.

Lieut. Comdr. Cecil C. Welch
(MC) U. S. Navy, 1904-1945

Maurice Theodore Sloane, Philadelphia; Medico-Chirurgical College of Philadelphia, 1914; member of the American Medical Association; medical adviser to the Veterans Administration; served during World War I; formerly on the staffs of Presbyterian and Woman's hospitals; died January 15, aged 57, of coronary thrombosis.

Benjamin Clinton Smith ⊕ Hillsboro, Texas; University of Texas School of Medicine, Galveston, 1909; served during World War I; in 1933 vice president of the State Medical Association of Texas; served as president of the Hill County Medical Society and the Twelfth District Medical Society; died January 11, aged 73, of coronary occlusion.

James Edward Smoot, Concord, N. C.; Baltimore Medical College, 1893; member of the American Medical Association; died in the Cabarrus County Hospital January 17, aged 81, of coronary thrombosis.

Charles Edward Spivey ⊕ Hamburg, Ark.; Baylor University College of Medicine, Dallas, 1910; superintendent of the Crossett (Ark.) Hospital from 1920 to 1944; died January 13, aged 70, of hypertensive heart disease.

William H. Stephens, Davenport, Iowa; Bennett Medical College, Chicago, 1883; died January 12, aged 90, of coronary thrombosis.

Patrick Alexander Sullivan, Chicago; Rush Medical College, Chicago, 1897; died in St. Elizabeth Hospital January 29, aged 82, of coronary heart disease.

Gilbert Julius Van der Smissen, New York; Columbia University College of Physicians and Surgeons, New York, 1895; member of the American Medical Association; served on the staff of Lenox Hill Hospital; staff physician to the personnel at the New York Zoological Park; died January 20, aged 75, of cerebral hemorrhage.

Albert August Watts ⊕ Gary, Ind.; Chicago College of Medicine and Surgery, 1915; formerly county coroner; served during World War I; on the staff of the Mercy and Methodist hospitals; died February 19, aged 61, of chronic myocarditis and virus pneumonia.

Elizabeth Marie Weaver, Claremont, Calif.; Cleveland College of Physicians and Surgeons, medical department of Ohio Wesleyan University, 1902; for many years practiced in Akron, Ohio, where she was on the staff of City Hospital; died in Pomona, January 12, aged 77, of cerebral hemorrhage.

Lieut. (jg) Parley D. Thompson
(MC) U. S. N., 1919-1945

Louise Whitman Farnam Wilson, Henfield, Sussex, England; Yale University School of Medicine, New Haven, 1920; certified by the National Board of Medical Examiners; formerly a medical missionary in China; died January 21, aged 57, of carcinoma.

KILLED IN ACTION

Cecil Charles Welch ⊕ Surgeon, Lieutenant Commander, U. S. Navy, White, S. D.; Northwestern University Medical School, Chicago, 1928; member of the Radiological Society of North America; accepted the commission in the medical corps of the U. S. Navy in July 1927; interned at the U. S. Naval Hospital in Chelsea, Mass.; served in the Manila Bay area at the time of its capitulation to the Japanese and was later reported as a prisoner of war by the prisoner of war information bureau, via Geneva; died while a prisoner of war of the Japanese, January 1945, aged 40, aboard a Japanese prison ship.

Parley Dale Thompson, Acting Assistant Surgeon, Lieutenant (jg), U. S. Navy, Sandy, Utah; Temple University School of Medicine, Philadelphia, 1943; interned at the Naval Hospital in Philadelphia, with supplementary training at St. Vincent's Hospital; in October 1944 was assigned to duty as medical officer on the new U. S. S. *Drexler* in Boston; early in 1945 sailed for action in the Pacific; was posthumously presented with the Navy Cross "for extraordinary heroism as a medical officer on board the U. S. S. *Drexler* when that vessel was sunk by Japanese suicide planes in the vicinity of Okinawa, Ruykyu Islands," May 28, 1945, aged 26.

Foreign Letters

LONDON

(From Our Regular Correspondent)

Feb. 26, 1949.

Free Medical Treatment for Foreign Visitors

An extraordinary provision of the National Health Service extends free treatment to foreigners visiting this country. A leaflet given to visitors arriving at British ports reads: "The National Health Service will provide you with all medical, dental and nursing care. Everyone—including visitors to this country, whether of British nationality or not—can use all or any complete part of it. There are no charges except for a few special items. And no insurance qualifications are necessary." It is stated in the press that news of this British service has got around France and other countries. Free National Health Service, dentures, spectacles and even operations may be luring cross-Channel trippers to Britain. But the insanity of producing this last result seems to have dawned on our socialist rulers. The Secretary of the British Medical Association reports that news has reached him, indirectly and not officially, that the Ministry has changed its view on the treatment of visitors from overseas. It has now made a rule that the benefits of the National Health Service do not extend to overseas visitors, whether foreign nationals or citizens of the Commonwealth or Colonies, if those visitors come to the country for the specific purpose of using the service. If, on the other hand, they should fall ill whilst here on a visit, they are entitled to use the National Health Service. But the difficulty arises to determine whether the visitor came to the country for the purpose of obtaining medical treatment or not. The *British Medical Journal* raises a legal point. Either the Act does or does not entitle foreigners to use the National Health Service. If it does, then a Government Department cannot make rules denying them the service. If, on the other hand, the Act does not entitle foreigners to use the service, then the law is being broken by offering the service to any foreigner.

Bill to Protect Children Against Milk Infected with Tubercle Bacilli

A bill to insure greater freedom of children's milk from the danger of tuberculosis passed its second reading in the House of Commons. In moving this the Parliamentary Secretary to the Ministry of Food, Dr. Edith Summerskill, said that it would have the effect of reducing the incidence of tuberculosis, disablement and even death. A recent survey revealed that the number of deaths from milk infected by tubercle bacilli was 15,000 a year, and many more thousands were crippled. So far as the child population is concerned the percentage was ten times greater in the rural areas, where more milk was drunk than in London. The bill limited the sale of milk, in areas to be specified, to classes of milk which were specially designated. Restrictions would also apply to milk supplied under welfare and school milk schemes. The policy would be in the first place to apply orders to groups in large urban areas, and then to extend the scheme so far as practicable to rural areas. It might be five or ten years before provisions applied to the country as a whole. Great progress has been made in improving milk in this country, but we cannot be satisfied with the present position.

In the discussion Mr. Hastings, laryngologist, said that 50 per cent of the cases of tuberculous meningitis were due to the bovine variety of the tubercle bacillus and were presumably due to the taking of milk. Another member advanced the argument that unpasteurized milk, even though infected with tubercle bacilli, has the effect of building up a gradual resistance until in time immunity is established. The Minister replied: "That is an argument advanced fifty years ago. Would you give your children milk containing tubercle bacilli in order to immunize them?"

The Midwife as the Doctor's Partner

A Working Party appointed by the Minister of Health to inquire into the reasons for the shortage of midwives and problems of recruitment has presented its report. They describe the midwife as "the practitioner of normal midwifery" and urge that she should attend the mother and baby at least a month after delivery. The limited means of analgesia at her disposal place her at a disadvantage in the face of the growing public demand for relatively painless childbirth, and they ask for an investigation by a committee of a more effective method for her use. Complaints have been received from both health officers and midwives that in the maternity service under the National Health Service general practitioners are tending to take over the whole of antenatal care and relegating midwives to the status of maternity nurses. In some cases midwives do not see the patient until they go to deliver her. Further, pupils are getting no opportunity to see antenatal care. This is entirely contrary to the development of the maternity services intended. A general practitioner should accept his full responsibility for his patient but should not exclude his partner the midwife. Doctor and midwife are complementary to one another and should thus work under the National Health Service.

The Royal College of Surgeons as an Educational Center

The Royal College of Surgeons is playing a much more important part in postgraduate study, for which it has become an international center. At the Hunterian festival dinner the orator, Mr. Henry Souttar, said that in his younger days the college resembled a mausoleum, but now at any time 300 to 400 students could be found there. He expressed the belief that some day the physicians would join with the surgeons in creating a medical academic center for the British Commonwealth. The president of the college, Lord Webb-Johnson, said that since the war it had become clear that the need for further development in teaching is urgent. Lord Nuffield's gift for the foundation of a college of surgical science attached to the college provided residential quarters for students, teachers and research workers. Responding to the toast of the guests, Prof. Lilian Penson spoke of London as richer than any other city in the world for scholarship, research and maintenance of a high tradition in learning.

International Congress of Biochemistry

The first International Congress of Biochemistry will be held at Cambridge August 19 to 24 under the presidency of Prof. A. C. Chibnall. The work has been divided into the following sections: Animal Nutrition and General Metabolism (chairman, Sir Jack Drummond); Microbiologic Chemistry (Miss M. Stephenson); Enzymes and Tissue Metabolism (Prof. R. A. Peters); Proteins (K. Bailey, Ph.D.); Clinical Biochemistry (Prof. E. J. King); Structure and Synthesis of Biologically Important Substances (Prof. A. R. Todd); Cytochemistry (Prof. N. J. Davidson); Biological Pigments—Oxygen Carriers and Oxidizing Catalysts (Prof. D. Keilin); Hormones and Steroids (Prof. F. G. Young); Chemotherapy and Immunochemistry (Sir Charles Harrington); Plant Biochemistry (C. S. Hanes); Industrial Fermentations (J. H. Bunker).

Prof. E. C. Dodds is chairman of the executive committee. Further information may be obtained from the Honorary Organiser of the Congress, 56 Victoria St., London, S.W. 1.

Sir William Hale-White

Sir William Hale-White, who had a prominent position among nineteenth century physicians, particularly as a writer, has died at the age of 91. He was appointed assistant physician to Guy's Hospital in 1885 and remained on its active staff.

During World War I he was consulting physician to war hospitals. A distinguished clinician, teacher and consultant, he was the author of several leading textbooks. "Materia Medica, Pharmacy, Pharmacology and Therapeutics" first appeared in 1892, ran through twenty-six editions and completed its one hundred and thirtieth thousand in 1944. His other books include "A Textbook of General Therapeutics" (1889); a "Textbook of Pharmacology and Therapeutics" (1901), and "Common Affections of the Liver" (1908). In 1923 he published a translation of selected passages from Laennec's "Treatise on Mediate Auscultation." After his retirement from practice he devoted his leisure to the study of medical history and produced a charming book on "Great Doctors of the Nineteenth Century." As a Guy's man he had a great affection for Keats and had the poet's "Anatomical and Physiological Note Book," compiled while he was a student at Guy's Hospital in 1814-1816, reproduced photographically. The final result was a book on "Keats as a Doctor and Patient." He also wrote a notable article on "The Bicentenary of the Birth of Oliver Goldsmith."

ITALY

(From Our Regular Correspondent)

FLORENCE, Feb. 24, 1949.

Leishmaniasis in Italy

Reports on the subject of leishmaniasis in Italy were presented at a meeting on tropical medicine. Professor Pullè, University of Bologna, reported on the cutaneous form of the disease, emphasizing that several thousand cases of this type occur in nearly all the regions of Italy. It is necessary to inform Italian practitioners of the means of combating the disease successfully which have now been perfected. The disease is transmitted by the bite of the sandfly and more precisely by the bite of Phlebotomus papatassii major. The form with the greatest incidence, known also under the name "oriental sore," may be healed, in general, by Professor Flarer's method of treatment.

Professor Girolami of Cagliari gave a report on visceral leishmaniasis in Italy, which was first described by Dr. Cigliano of Forio d' Ischia in a study which remained unknown for many years. In 1880 Professor Cardarelli of the University of Naples studied the disease and described it under the name "infectious splenic pseudoleukemia in children"; in 1905 Pianese discovered the causative agent and observed that it is similar to that of the Indian kala-azar discovered by Leishman and Donovan in 1903-1904. While adults and children may be affected by Indian kala-azar, in Italy the disease is observed most frequently in children less than 5 years of age, commonly of male sex.

The infection is contracted most frequently in the country, in small rural centers and at the periphery of centers with large population. The disease affects mainly agricultural people and has its greatest incidence in the Southern regions and on the big islands. The major foci of infection are at the foot of the major volcanoes, the environs of Naples and Catania. The reasons for this particular distribution are not known. Dogs are the specific reservoir of the virus.

Fever, splenohepatomegaly and hematic changes are of primary importance in the clinical picture; intestinal, hemorrhagic, general and respiratory symptoms may be observed frequently. The fever curve is fairly irregular; the attacks of fever—in general—are of short duration and may recur within twenty-four hours.

The changes of the blood are characterized by the presence of constant oligochromemia, oligocythemia and leukopenia with relative lymphocytosis. In the bone marrow one may observe cellular pictures which vary according to the individual patient: hemocytoplastic or lymphocytotic or aplastic bone marrow.

Leishmaniasis may be associated with other diseases such as pulmonary tuberculosis and brucellosis. Diagnosis by clinical features may in addition be established by the demonstration of the specific parasite in the bone marrow or in the spleen, in the hepatic juice or in the circulating blood.

The Italian school, with Di Cristina, Caronia and Castellani, has made great contributions to the progress in treatment of visceral leishmaniasis. It is based on the specific chemotherapeutic action of antimony, which may be employed in the form of antimony potassium tartrate with highly satisfactory results.

Congress of Orthopedists and Traumatologists

The Italian Association of Orthopedists and Traumatologists held its twenty-third national congress in Bologna. Reports were presented on "Reparative Surgery of the Hand" and "Treatment of Static Changes of the Plantar Arch."

Professor Marcer of Parma, who reported on the first subject, pointed out the technical difficulty involved in reparative surgical treatment of the hand; the procedure often is difficult and disagreeable, and hence may be neglected frequently. Operative success often depends on many small but important technical details; the operation requires the most perfect asepsis, an "atraumatic" technic and constant functional reeducation. He described the methods of surgical repair of the cutaneous lesions and of the bone lesions of the hand besides those of the joints and recalled the various interventions for the cure of pseudarthrosis of the scaphoid to correct camptodactylia and for surgical treatment of habitual dislocation of the first carpometacarpal joint. He then described the reparative surgical treatment of tendon lesions of the hand, recalling the various methods of tendon transplants and grafts with the modern technic suggested by Bunnel and Iselin.

Professor Albanese, of Sampierdarena, reported on the treatment of static changes of the plantar arch, distinguishing between talipes cavus and flatfoot. The speaker established some definite rules of treatment which may be summarized as follows: (*a*) to observe the manifestations of incomplete physiologic evolution, but to refrain from intervention; (*b*) early intervention in an attempt to modify the skeletal conditions not only in the congenital forms but also in those "potential" ones of arrest or of deficient development. Based on these concepts the therapeutic directions have been modified during the last few years as follows: Confidence is always slight with regard to the curative efficiency of orthopedics by which an incomplete action is carried out on the form and orientation of the bones; physical exercises are looked on slightly less favorably; they are still valuable as a means of stimulating the course of some phases of the development and of supporting more energetic therapeutic procedures. Orthopedic and gradual corrective measures are gaining in favor, in analogy to those practiced in other congenital malformations. Among the methods of surgical treatment, dissection or plastic repair of the achilles tendon will still be looked on favorably by the majority of surgeons.

Transplants and grafts of tendons still enjoy much favor among German and Italian authors, but are looked on less favorably in America; they are not taken into consideration in France. Interventions on the skeleton received a noteworthy impulse from recent pathogenetic and anatomicopathologic progress. The majority of the workers favor intervention on the mediotarsal bones and joints, employing conservatory and modeling procedure.

The talipes cavus is a complex deformity consisting in hypertonicity and retraction of the elements supporting the plantar arch, in a want of equilibrium of the power of the various muscular groups and in changes of form and position of the skeletal elements which constitute the planking of the plantar arch.

With regard to surgical treatment there is nearly general consensus that it is necessary to influence the elements supporting the plantar arch; with regard to the mode of attack, the concept of intervention by exposure of the surgical field prevails. Among the various routes of access the median enjoys the greatest preference because of ample light; it is free of risk and allows for carrying out the intervention on any element of the planta. The want of muscular equilibrium can be corrected only by means of transplants.

BRAZIL

Rio de Janeiro, Feb. 29, 1949.

Pathologic Process of Murine Leprosy

A comprehensive description of the evolution of the pathologic process in the murine variety of leprosy has been made at the therapeutic laboratory of the Fundação Paulista contra a Lepra, in São Paulo, by Drs. W. A. Hadler and A. C. Mauri. Working with 265 rats of the McCollum and Wistar strains infected by peritoneal inoculation, they observed and described in detail the successive stages of the evolution of experimental murine leprosy. The peritoneal inoculation originates a generalized infection, with a progressive evolution without tendency to spontaneous regression. As a rule, the lesions begin by proliferation of the reticuloendothelial elements, followed by differentiation of leprous cells, these increasing in number and giving place to diffuse infiltrates which grow in size and then take a delimited form to constitute a leprous nodule. In the peritoneum the alterations have two distinct stages. The first occurs in the peritoneal cavity, where an afflux of blood elements is first observable, followed by reticuloendothelial elements, endothelial macrophages and reticular macrophages. The bacilli are encountered first in the neutrophils and later almost exclusively in the elements of the reticuloendothelial system. The second stage takes place in the peritoneum, where subserous leprous cells are manifest, giving origin to leprous nodules. By the eighth day nodules are visible microscopically, and around the hundred and twentieth day actual tumors are found, accompanied by necrosis and central autolysis. Twenty-four hours after the inoculation it is possible to notice, in the mediastinal and retroperitoneal lymph nodes, areas in which endothelial cells of the lymphatic sinus are mobilized and which contain bacilli in the cytoplasm. The leprous cells increase in number and invade the radial lymphatic sinuses, presenting an irregular form. From the fifth day on, the leprous infiltration takes a rounded form, creating nodular lesions with a great number of bacilli. Until about the fiftieth day the lesions show no alteration, but from then on they begin to increase in size, fusing one with another, with the number of bacilli greatly increased. By the one hundred and fiftieth day a central necrosis begins, followed by autolysis, and about the one hundred and eightieth day more than two thirds of the ganglial tissue is destroyed.

In the liver, an intumescence of the Kupffer cells with bacilli in the cytoplasm is apparent by the tenth day, followed by infiltration of lymphoid cells without bacilli around the interlobular areas and centrolobular veins. Between the twentieth and the twenty-fifth day some histiocytes containing bacilli are found in these infiltrations, which after that begin to form leprous nodules. After the eightieth to one hundredth day the nodules show necrosis and autolysis. In the spleen, two or three days after the inoculation it is already possible to find bacilli in the endothelium of the venous sinuses and the reticular cells of the red pulp. Around the thirtieth day leprous nodules are formed in the white and red pulp of the organ, with few bacilli, the lesions then becoming stationary. There are very slight lesions in the kidneys, where only in the advanced stage (about the one hundred and fiftieth day) a hyaline punctiform degeneration is observable in the parenchyma. The interstitial cells of the lungs and the reticular cells of the bone marrow present bacilli from the very day of the inoculation.

The authors are now beginning to use this method of study as a control test of the efficiency of some of the drugs used to treat human leprosy.

Decline of Diphtheria Mortality

Diphtheria has long been prevalent in Rio de Janeiro. Before the advent of antitoxin treatment the diphtheria mortality was always high, epidemics having been registered in several years. From 1871 to 1890, the average annual mortality rate from the disease was 16.1 per hundred thousand, with rates as high as 29.6, 31.2, 35.3 and 43.4, respectively in 1888, 1887, 1885 and 1883. After treatment with antitoxin was begun this high mortality level was lowered, and during this long period from 1891 to 1940 the annual death rate from diphtheria was almost constantly high, death rates of 5, 7, 9 and 10 per hundred thousand having been registered many times, with the general average of 6.2 per hundred thousand for the whole period of fifty years. Ten years ago, a program of improvement of case reporting and of active immunization was begun, the work having gained momentum in the last four years. During this period the mortality has consistently declined, as is shown by the annual death rates for 1941 and the following years: 10.7, 7.9, 5.9, 6.1, 3.5, 4.5, 4.1 and 4.0. The number of persons actively immunized is increasing, from a little more than 5,000 five years ago to almost 35,000 in 1948. During the present year the health department hopes to decrease the diphtheria mortality to about 2 deaths per hundred thousand. A great effort is being made to concentrate the immunization to children below 5 years of age, among whom about 30 per cent of the deaths from the disease occur.

Rutin as a Treatment of Pemphigus Foliaceus

Dr. Josefino Aleixo of the University of Belo Horizonte published a preliminary report on the use of rutin for the treatment of "wild fire" (pemphigus foliaceus). He was led to try this kind of treatment by the fact that wild fire is now prevalent in the poor farm laborers of the states of São Paulo and Minas Gerais who use little wheat as food, in contradistinction to Syrian immigrants working in towns and using a large amount of wheat in the form of a dish called "kibi." Dr. Aleixo never saw a case of wild fire in these Syrian workers. Starting from the fact that Griffith and Lindauer showed the good results of rutin in cases of capillary fragility, and from the work of J. Kirle, E. Mendes and A. Lindberg, who demonstrated capillary changes in pemphigus foliaceus as a consequence of Rossle's serous inflammation, Dr. Aleixo used rutin, a chromoglucoside extracted from buckwheat. He says that cases of wild fire treated with rutin have shown that the bullous eruption is prevented, and when present it disappears rapidly, a fact that he had never seen with any other treatment.

A Joint Health Committee of the Armed Services

A Joint Health Committee of the Armed Services was recently created, constituted by the three Surgeons General of the Army, the Navy and the Air Force, to establish a common doctrine of action and uniformity of methods and resources. The principal functions of the committee are the establishment of general norms of health for the selection of personnel to the armed forces, the adoption of standard measures of prevention of diseases and of medical and surgical treatment, the standardization of therapeutic resources, the adoption of a common nosologic nomenclature and a uniform system of records, the establishment of a system leading to the common use of all hospitals, clinics and centers of treatment and the organization of a common plan of control of the physical and mental efficiency of the armed services' personnel.

Correspondence

TREATMENT OF ACUTE RENAL INSUFFICIENCY

To the Editor:—Under Correspondence in THE JOURNAL, February 12, page 473, appeared a communication from Dr. Alfred P. Fishman. Dr. Fishman quoted from a paper presented by Daniel Marshall and myself before the Central Society for Clinical Research in Chicago, Oct. 31, 1948, in regard to our management of lower nephron nephrosis. Since our paper was at that time unpublished and since it did not deal at all with management but with the altered renal function in lower nephron nephrosis, Dr. Fishman could not quote correctly either our words or our ideas. (This paper has in the meantime appeared in the *Journal of Laboratory and Clinical Medicine,* 34: 31 [Jan.] 1949).

We have expressed our ideas on management in a paper which will appear soon in the *Archives of Internal Medicine.* In this report, we explicitly state that once the renal lesion of lower nephron nephrosis is well established, there is no known method for producing diuresis until some degree of healing occurs. For this reason, the aim of treatment should be not to get the damaged kidney to secrete against all odds but instead to keep the patient alive until the tubules recover enough to reverse the retention of excretion products. We have thus, contrary to Dr. Fishman's implications, definitely stressed the spontaneous resolution of the anuria.

Our management involves the maintenance of normal nutrition and the attempt at restoration to normal of the electrolyte composition of the extracellular fluids (and plasma). We have recommended 3 liters of saline plus lactate during the first 24 to 36 hours to rule out oliguria on the basis of dehydration and hyponatremia alone, for in such cases in which the kidneys have not been organically damaged such treatment has been sufficient to initiate a diuresis. With the persistence of the oliguria we administered 1 to 2 liters of saline with lactate daily in order to raise the serum chloride and sodium concentrations toward normal and to allow a slow accumulation of edema fluid. In our more recent cases we have recognized that the administration of even considerable quantities of 0.9 per cent salt solution will not adequately raise the serum sodium concentration and we have therefore utilized daily intravenous injections of 500 cc. of 3 per cent salt solution. This procedure is in agreement with that recently proposed by J. P. Peters (*Surgery* 24: 568, 1948). On such a regimen, whether because of the dilution effect of the edema fluid or because of the protein-sparing action of the raised serum sodium concentration, the blood urea concentrations have tended to reach a plateau and the patients have felt well. At no time have we advocated large volumes of fluid "to open the kidneys." This unphysiologic phrase, imputed to us by Dr. Fishman, is not our invention.

We find no objection to Dr. Fishman's regimen if it can accomplish what he claims for it without production of edema and with normal electrolyte composition of the serum. However, it has been our experience that edema develops in these patients under any circumstances if food and drink are allowed and that this expanded extracellular fluid has a low sodium and chloride concentration, which can be corrected only by hypertonic salt solution administered of necessity intravenously. It is an illusion to believe that edema from oral or subcutaneous fluid and salt administration is more innocuous than that from intravenous injection. It is not intravenous fluid administration which causes the strain on the heart in these cases but the uremia itself and its accompanying rise in blood pressure. In patients who die in uremia from whatever cause, myocardial failure is usually an important terminal factor whether much or little fluids have been given.

Finally, we agree with Dr. Fishman that many of these patients might recover with any of several treatments, and that the mortality of 80 to 90 per cent reported in the cases involving battle injuries is probably due to complicating factors such as excessive protein breakdown. But we are forced to believe that a management such as ours involving only one death in 12 cases (none in the last 10) has some merit.

WILLIAM S. HOFFMAN, M.D.
Director of Biochemistry,
Hektoen Institute for Medical Research
of the Cook County Hospital, Chicago

PENICILLIN IN MALARIA

To the Editor:—In his letter concerning penicillin in the treatment of malaria published in THE JOURNAL, March 12, page 734, Dr. Deshmukh comments that had I read a reprint of his article (Deshmukh, P. L.: Treatment of Relapsing Malaria with Specific Antimalarial Drugs in Combination with Penicillin, *Indian M. Gaz.* 82: 511 [Sept.] 1947). I should not, perhaps, have rushed to your columns with my letter published in THE JOURNAL, Aug. 28, 1948, page 1632. In my letter I stated that there is evidence to prove that penicillin does not affect malaria. After reading his article again, a reprint of which Dr. Deshmukh kindly sent me, I still believe that his conclusions that penicillin acts on the preerythrocytic stage of malaria are unfounded.

Dr. Deshmukh cites 2 cases in support of his thesis. One patient, a woman 34 years old, seen during an acute attack of malaria with a history of a previous attack a year before, was treated with quinine, quinacrine hydrochloride and penicillin, and during the following four months was free of relapses. The other, a 24 year old man who had had "repeated attacks of fever with rigor for the last six months off and on," was similarly treated and had no recurrence during the subsequent three months. He states that 4 other patients who were similarly treated had been followed six to eight weeks without relapse.

The evidence presented is valueless to prove that penicillin was in any way concerned with the absence of relapse during the periods of observation. The first patient had previously experienced a year without an attack of malaria. The attack observed by Dr. Deshmukh may have been a relapse or a new infection. She might have gone another year or longer without further attacks of malaria if no penicillin had been given. The second patient, likewise, might well have experienced more than three months without a relapse without penicillin treatment. As for the 4 other cases cited, the follow-up period of six to eight weeks was far too short for them to be considered. Dr. Deshmukh has no controls in his series. One must have observations on a number of cases and controls, similar in all respects including age, type and duration of infection, and pattern of relapses, differing only in regard to treatment with or without penicillin and followed for a period of many months before any tentative conclusions may be drawn.

During the recent war years a large number of patients with relapsing vivax malaria from the Southwest Pacific area were given various forms of antimalarial therapy and held under observation for periods of four months to a year. Treatment with quinine, quinacrine, chloroquine, S.N. 6911, or other preparations was followed by relapses within four months in about two thirds of the cases, regardless of preparations used, although chloroquine delayed the relapses longer than the others. The remaining third of the patients failed to relapse during the observation period, regardless of type of therapy. In other words, in any group of cases of vivax malaria, a certain proportion will be experiencing their last relapse, and if the same group is followed for three years, if reinfections are not occurring, malaria will have terminated in nearly all. The supply of preerythrocytic forms will be exhausted.

A number of these patients were given courses of penicillin therapy for conditions other than malaria, during or between relapses of malaria. This group continued to relapse at about the expected rate, indicating that penicillin did not affect the preerythrocytic forms of the parasite.

George M. Saunders, M.D.
Assistant Professor of Preventive
Medicine, Washington University,
St. Louis

INTERNSHIPS

To the Editor:—On December 14, 1948, I directed an inquiry to the administrators of the forty-one hospitals in New Jersey offering approved internships. On December 22 I had received twenty-eight replies. Authorities familiar with questionnaires assure me that this represents considerable interest and, perhaps, some emotional drive on the part of the recipients of the questionnaire. There was one direct question: "How many interns do you have under contract for 1949-1950?" The replies indicated that twenty-eight hospitals had 113 interns under contract and 303 internships were approved. On the basis of the replies received it would appear that the hospitals in New Jersey are getting 37⅔ per cent of the interns for which they are approved and for which they obviously have need.

The remarks which were volunteered by the officials who responded to the questionnaire were:

> We have followed the present method of appointment exactly as outlined. After two years' experience I do not believe it is an efficient method of obtaining interns as far as this hospital is concerned.
>
> We need ten. You are doing just what I threatened to do. We accepted fourteen applicants and got one. The situation is critical.
>
> Normal quota is ten at $100 per month plus maintenance. Very difficult to obtain interns. We advertise in The Journal of the American Medical Association.
>
> I have your letter of December 14 concerning the present system of distribution of interns. Up to this year we have always been successful in securing our quota of interns at this hospital.
>
> This year the situation is what I call disastrous. For the July 1, 1949 class we have one intern signed up; we are short seven interns.
>
> Whether this can be blamed on the method of distribution, or the shortage of medical school graduates I do not know, but the situation we, as a 250 bed hospital, find ourselves in for next year is certainly not encouraging. I understand that practically all hospitals in the state are faced with this acute shortage of interns.
>
> At the present time we have twenty-three interns for twenty-four appointments. Beginning July 1, 1949 we will have seventeen interns for twenty-four appointments.
>
> I am very much opposed to the present procedure of the appointment of interns. The deans of the medical colleges and the American Hospital Association have agreed that intern appointments cannot be made before November 15 of each year and all hospitals make their appointments at the same time. They give the prospective intern seventy-two hours to make up his mind as to which intern appointment he wishes to accept. I feel we should allow the prospective intern the privilege of seeking his internship rather than to a have a number of appointments offered to him at one time. He is swamped with telegrams and even telephone messages at midnight beginning November 15.
>
> I consider that the present system is most unsatisfactory for nonteaching hospitals. No system at all would be better than this.

Obviously the system of procurement and assignment of interns is not satisfactory to the rank and file. I have introduced several resolutions into the House of Delegates in years gone by in an effort to inquire into this defect.

Hilton S. Read, M.D.
The Ventnor Clinic, Atlantic City, N. J.

Note.—The letter was referred to the office of the Council on Medical Education and Hospitals, which replies:

To the Editor:—The data furnished by Dr. Read for twenty-eight hospitals in New Jersey are in essential agreement with the statistics presented in the Internship and Residency Number of The Journal, May 1, 1948, which indicated that the majority of small nonteaching hospitals are having difficulty in filling their internships.

The Uniform Intern Placement Plan was adopted to eliminate the practice of offering appointments to medical students early in their undergraduate course, in some instances as early as the sophomore year. It was the general feeling of medical educators and hospital administrators that if this practice were allowed to continue, the entire system of intern appointments would become chaotic to the point of prejudicing the interests of interns and hospitals alike. The plan does not and cannot assure the participating hospitals a full quota of interns. It is recognized that violations of its regulations exist which tend to undermine general acceptance of the plan. The majority of hospitals, however, have complied with its requirements and when successful in attracting the required number of interns have found the system satisfactory.

Interns have always been attracted to those hospitals which in the opinion of recent graduates provide the best training. It is on the basis of offering a superior program that hospitals must expect to compete for interns.

The basic problem involved is one of supply of interns rather than of distribution. Given the present number of graduates, it is impossible to meet the house staff requirements of all hospitals requesting interns. An increase in the number of hospitals offering two year, rather than one year, internships would of course result in a decreased annual demand, alleviating the problem to some extent. Until this trend has developed to a considerably greater degree, however, it will be necessary for many hospitals to continue to furnish a high level of medical care without relying on interns.

In accordance with the recommendations of the Reference Committee on Medical Education, as adopted by the House of Delegates at the annual meeting June 25, the Council is presently engaged in reviewing all approved internships. It is anticipated that a number of hospitals currently approved will not be able to meet present requirements and approval in these instances will necessarily be discontinued.

Council on Medical Education and Hospitals

LICENSURE OF FOREIGN MEDICAL GRADUATES

(The Committee on Foreign Medical Credentials, an unofficial body sponsored by the Council on Medical Education and Hospitals of the American Medical Association and composed of invited individuals from organizations interested in the problem of foreign physicians, is issuing for the information of the public and the governmental agencies concerned with the licensure of physicians a summary of the problems involved in the licensing of foreign medical graduates and its recommendations for their solution. The membership of the Committee includes individuals from the following organizations:

Advisory Board for Medical Specialties
Association of American Medical Colleges
Council on Medical Education and Hospitals
Department of State (observer)
Federation of State Medical Boards of the United States
Illinois Department of Registration and Education
Institute of Inter-American Affairs
Institute of International Education
W. K. Kellogg Foundation
Minnesota State Board of Medical Examiners
National Board of Medical Examiners
New York State Board of Medical Examiners
New York State Department of Education
Pan American Sanitary Bureau
Rockefeller Foundation
United States Office of Education
Wisconsin State Board of Medical Examiners
World Health Organization
World Medical Association)

The licensure of physicians who have received their medical degrees from foreign institutions seems certain to present a growing problem for the licensing bodies of the forty-eight states, the District of Columbia and the territories and outlying possessions of the United States and for the National Board of Medical Examiners. The unsettled economic and political conditions in many parts of the world have already stimulated many physicians to migrate to the United States, and it may be predicted that the number seeking to migrate will increase in the years ahead. In addition, each year a number of Americans enter foreign medical schools with the expectation of returning to the United States to practice. Some of these students study abroad because they are unable to gain admission to an American medical college, while others do so from choice.

The problem of the physician who has graduated from a foreign medical school promises to confront the public, various legislative bodies and the licensing boards with increasing frequency during the next several years. The problem has important and far reaching implications for the health and safety of the people of the United States. It is important, therefore, that the public be provided with information to serve as the basis for intelligent opinion and that legislative and licensing bodies be prepared to adopt an enlightened policy in deciding questions pertaining to the licensure of foreign-trained physicians

Two basic principles are involved in the licensure of physicians whether they be graduates of domestic or foreign schools. The first principle and one that has long been recognized by all states and nations is the requirement that a physician satisfy a licensing body representing the public as to his competency before he is permitted to practice. This principle is essential for the protection of the public. Without this requirement, the people of a community cannot distinguish those physicians who are competent to provide medical care from those who are not.

Similar requirements for licensure or equivalent certification by an appropriate public agency have been established for the protection of the people in many professional and nonprofessional occupations. Such occupations include architects, dentists, engineers, veterinarians, lawyers, nurses, electricians and plumbers. The principle of licensure by legally created agencies of the state has become so well established in our society that its value and validity cannot be questioned.

The second principle involved is that the training a man has undergone in preparing to enter a profession is a paramount factor in determining the quality of his professional practice. It must be admitted that exceptional men may rise above the limits of their training, but this achievement is frequently accomplished only after years of experience in practice and additional training. To allow an inadequately trained physician to attempt to perfect himself through the mistakes of years of practice is to permit unwarranted and unnecessary abuse of patients who entrust their health and lives to him.

An important corollary of this second principle is that the best assurance of the quality of the training that a physician has received is an intimate knowledge of the faculty, facilities, curriculum and standards of the medical school from which he has graduated. The art and science of conducting examinations has not yet advanced to the point where full reliance can be placed on the results of the type of examinations to which licensing boards are limited by considerations of practicality. Only when the results of such examinations are coupled with an evaluation of the quality of training that a physician has received can a licensing board be reasonably confident that a physician is adequately prepared to assume the responsibilities that are an inevitable part of his practice.

In licensing graduates of American and Canadian schools, the various state licensing boards have for many years had the benefit of the findings of periodic thorough surveys of these schools carried out by the two accrediting bodies, the Council on Medical Education and Hospitals of the American Medical Association and the Association of American Medical Colleges. Some of the state licensing boards supplement this information with investigations of their own, although it is beyond the resources of most boards to inspect periodically all the eighty medical schools in the United States and Canada.

It should be pointed out that the present high standard of medical practice in the United States has been the direct result of the recognition by the licensing boards that evaluation of the school from which a physician graduates is equally important as evaluation of the physician himself. Before this principle was generally recognized, the country was overrun with physicians who, armed with a degree from a low grade school or outright diploma mill, succeeded in one way or another in passing the examinations for licensure. The needless suffering and injury perpetrated by the incompetent and at times fraudulent practices of many of these inadequately trained men constitute a dark chapter in the history of medicine.

While it has been possible for the two accrediting agencies referred to above to maintain current appraisals of the quality of education offered by American and Canadian medical schools, it has been beyond their resources to attempt to maintain a similar inventory of the three hundred or more medical schools in other parts of the world. For many years this was not important because the numbers of physicians migrating to the United States was small and most foreign-trained physicians came from medical schools that were well known in America.

Between 1930 and 1939 two developments occurred that entirely changed the situation. Unsettled and unfavorable conditions abroad prompted large numbers of physicians to migrate to this country. At the same time, internal developments in many countries led to a rapid deterioration in the quality of medical education. This change, which was readily apparent to American physicians traveling abroad in the years immediately prior to the war, was greatly accelerated when these countries became involved in World War II. The pressures of the war reduced the quality of medical education in all countries, including the United States, but in many countries the effect was catastrophic. Faculties were decimated, buildings, libraries and equipment were destroyed or badly damaged, all contact with scientific developments in other countries was interrupted and standards were lowered in an effort to turn out large numbers of physicians to serve the armies of the warring nations. By the end of the war, medical education in other countries, with few exceptions, had degenerated to a degree that was shocking to those who had known these countries in the period up to 1930. While medical education in the United States recovered quickly from the war and is now at the highest point in its development, unsettled political and economic conditions in many foreign countries have prevented any similar recovery. Even more disturbing is the fact that some foreign countries appear to be committed to educational policies that are so unsound and so inferior that there is serious doubt that satisfactory standards of medical education will be reestablished at any time in the foreseeable future.

It is against this background that the problem of the foreign-trained physicians must be studied. Their complete exclusion from the United States cannot be reconciled with the traditional role of this country as the land of opportunity. The fact that few foreign countries will admit the graduates of American medical schools to practice should not be accepted as a valid reason for pursuing a reciprocal policy. It is well, however, for the people to know that the United States is the most liberal of all countries in licensing physicians who have not graduated from their own schools.

While a policy of complete exclusion cannot be defended, it is clear that until more information can be obtained about the present quality of medical schools abroad, the licensing boards would fail in their responsibility to the public if they did not use the greatest care and discretion in admitting foreign-trained physicians to their examinations.

Detailed current knowledge of foreign medical schools is indispensable for the guidance of state licensing boards in determining which foreign physicians have had sound training. It is essential that the various agencies concerned with this problem unite their resources and devise a satisfactory method for securing this information at the earliest possible date. It will not be an easy task and it is improbable that well documented evaluations can be made of all foreign schools in the same manner as is done for American and Canadian schools. The geographic and physical aspects of the problem alone present great difficulties. International relations will undoubtedly also limit the extent to which such a study can be carried out. One of the greatest difficulties will be to appraise accurately the great changes and fluctuations through which many schools have passed and are continuing to pass.

From such a study, however, it should be possible to derive a list of foreign medical schools which have maintained during specific periods, or are now maintaining, educational programs sufficiently comparable to the training offered by the medical schools of this country to warrant the admission of their graduates to the examinations of the licensing boards of the forty-eight states, the District of Columbia and the territories and outlying possessions of the United States as well as the examinations of the National Board of Medical Examiners.

As an added safeguard it would seem entirely reasonable that, whenever a candidate cannot present evidence to a state licensing board that he is sufficiently familiar with recent scientific advances in medicine, with the practices and customs of American medicine and with the English language, he be required to take additional training in this country before being permitted to appear for examination. There is every reason to believe that the various licensing boards can develop regulations covering these points that will be fair to the foreign graduate and adequate to protect the public.

The American people are today well served by the licensing boards which they have duly constituted by law to protect them from incompetent practitioners of the healing arts. It is to be hoped that the people will continue to have confidence that these licensing bodies are acting for their best interests according to well established principles.

The licensing bodies and the governments to which they are responsible have a heavy obligation to continue their efforts to maintain high standards of medical practice. They must also recognize that the spirit and tradition of America places on them an obligation not to deny the opportunity to practice his profession to any citizen or prospective citizen who can demonstrate satisfactory qualifications as to his professional competence and character.

If the problem of the foreign medical graduate is approached in this spirit, the Committee on Foreign Medical Credentials is confident that it will be solved without lowering the standards of American medicine and in a manner consistent with our national ideals of justice and humanitarianism.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II.* Various Centers. June 20-22, Sept. 12-14. *Part II.* April 25-26. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY, INC. *Written.* Various Centers. July 15. *Oral.* Oct. 16-20. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Ave., New York 27.

AMERICAN BOARD OF INTERNAL MEDICINE: *Oral.* Philadelphia, June 1-3. *Written.* Oct. 17. Final date for filing application is May 1. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral.* Chicago, June 1949. Sec., Dr. W. J. German, 310 Cedar Street. New Haven. Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY, INC.: *Oral.* Chicago, May 8-14. Sec., Dr. Paul Titus, 1015 Highland Building, Pittsburgh 6.

AMERICAN BOARD OF OPHTHALMOLOGY: *Oral.* New York, June 11-15; St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. *Part I,* New York City, April 22-23; Atlanta, Ga., April 29-30; Indianapolis, May 6-7 and Denver, May 13-14. *Part II.* New York City, Jan. 1950. Final date for filing application for Part II is Aug. 15. Address: Dr. Francis M. McKeever, 1136 W. 6th St., Los Angeles 14, Calif.

AMERICAN BOARD OF OTOLARYNGOLOGY: New York, May 11-14; Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PEDIATRICS: *Oral.* Baltimore, May 7-9. Exec. Sec., Dr. John McK. Mitchell, 6 Cushman Rd., Rosemont, Pa.

AMERICAN BOARD OF PHYSICAL MEDICINE. Philadelphia, June 4-5. Sec., Dr. R. L. Bennett, 30 N. Michigan Blvd., Chicago.

AMERICAN BOARD OF PLASTIC SURGERY: *Examinations are given in* June and November of each year in the home town of applicants. Sec., Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF PREVENTIVE MEDICINE AND PUBLIC HEALTH: Washington, D. C., May 14-16. Sec.-Treas., Dr. Ernest L. Stebbins, 615 North Wolfe St., Baltimore.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY, INC. December, New York City. Sec., Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF RADIOLOGY. Atlantic City, June 2-4. Sec., Dr. B. R. Kirklin, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written.* Various Centers, October 26. *Final date for filing application is July 1.* Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: Feb. 1950. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination.* Montgomery, June 28-30. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

ARKANSAS: * Little Rock, June 9-10. Sec., Dr. L. J. Kosminsky, Texarkana. *Eclectic.* Little Rock, June 9-10. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

CALIFORNIA: *Examination.* San Francisco, June 20-23. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento.

DELAWARE: Dover, July 12-14. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

DISTRICT OF COLUMBIA: * *Written,* Washington, May 9-10. Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., Washington.

FLORIDA: * *Examination,* Jacksonville, June 26-28. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

GEORGIA: *Examination.* June 8-9, Atlanta and Augusta. *Reciprocity.* Atlanta, June. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

GUAM: *Endorsement.* Agana, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam. ℅ F.P.O., San Francisco, Calif.

HAWAII: * *Examination.* Honolulu, July 11-14. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu.

IDAHO: Boise, July 11-13. Sec., Miss Estella S. Mulliner, Bureau of Occupational Licenses, 355 State House, Boise.

INDIANA: *Examination.* Indianapolis, June 21-23. Sec. Board of Medical Registration and Examination. Dr. Paul R. Tindall, 416 K. of P. Bldg., Indianapolis.

IOWA: * *Examination.* Iowa City, June 13-15. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

KANSAS: Kansas City, June 1-2. Sec., J. F. Hassig, 905 North 7th St., Kansas City, Kans.

KENTUCKY: *Examination.* Louisville, June 15-17. Sec., Dr. Bruce Underwood, 620 S. 3rd St., Louisville 2.

MARYLAND: *Examination.* Baltimore, June 21-24. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homeopathic.* Baltimore, June 14-15. Sec., Dr. John A. Evans, 612 West 40th St., Baltimore.

MINNESOTA: * Minneapolis, April 19-21. Sec., Dr. J. F. Du Bois, 230 Lowry Medical Arts Bldg., St. Paul 2.

MISSISSIPPI: Jackson, June 21-22. Asst. Sec., Dr. R. N. Whitfield, State Board of Health, Jackson.

MISSOURI: *Examination.* St. Louis, May 30-31 and June 8-10. Exec. Sec., Mr. John A. Hailey, Box 4, Jefferson City.

NEBRASKA:* *Examination.* Omaha, June 6-8. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Building, Lincoln 9.

NEVADA: Carson City, May 2. Sec., Dr. G. H. Ross, 112 N. Curry Street, Carson City.

NEW JERSEY: *Examination.* Trenton, June 21-24. Sec., Dr. E. H. Hallinger, 28 West State Street, Trenton 8.

NEW YORK: Albany, Buffalo, New York and Syracue, June 28-July 1, Sec., Dr. Jacob L. Lochner, 23 South Pearl St., Albany.

NORTH CAROLINA: *Endorsement.* Pinehurst, May 9. *Examination.* Raleigh, June 23-25. Sec., Dr. Ivan Procter, 226 Hillsboro St., Raleigh.

NORTH DAKOTA: * *Written,* Grand Forks, July 5-7. *Reciprocity,* Grand Forks, July 8. Sec., Dr. C. J. Glaspel, Grafton.

OKLAHOMA: * Oklahoma City, June 8-9. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

OREGON: * *Endorsement.* Portland, April 29-30. *Examination.* Portland, July. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg., Portland.

PENNSYLVANIA: *Examination.* Philadelphia and Pittsburgh, July. Acting Sec., Mrs. B. G. Steiner, 351 Education Bldg., Harrisburg.

PUERTO RICO: San Juan, Sept. 6-10. Sec., Dr. Luis Cueto Coll, Box 3717, Santurce.

RHODE ISLAND:* *Examination.* Providence, July 7-8. Chief, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH CAROLINA: *Examination.* Columbia, June 27-29. *Endorsement.* Columbia, May 2, June 27-28, Aug. 1, Sept. 5 and Oct. 3. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * *Examination.* Pierre, July 19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

TEXAS: *Examination.* Austin, June 16-18. Sec., Dr. M. H. Crabb. 209 Medical Arts Bldg., Fort Worth 2.

UTAH: *Examination.* Salt Lake City, July. Sec., Dept of Registration. Miss Rena B. Loomis. 324 State Capitol Bldg., Salt Lake City.

VIRGINIA: *Examination.* Richmond, June 17-18. *Reciprocity.* Richmond. June 16. Dr. K. D. Graves, 631 First St., S.W., Roanoke.

WASHINGTON: * Seattle, July. Sec., Mr. Edward C. Dohm, Department of Licenses, Olympia.

WISCONSIN: * *Examination.* Milwaukee, June 28-30. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

WYOMING: Cheyenne, June 20. Sec., Dr. Franklin D. Yoder, Capitol Bldg., Cheyenne.

---

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ARKANSAS: *Examination.* Little Rock, May 3. Sec., Mr. L. E. Gebauer, 1002 Donaghey Bldg., Little Rock.

COLORADO: *Examination.* Denver, June 1-2. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver.

CONNECTICUT: New Haven, June 11. Exec. Asst., State Board of Healing Arts, Miss Mary G. Reynolds, 110 Whitney Ave., New Haven 10.

DISTRICT OF COLUMBIA: *Examination.* Washington, April 18-19 Sec., Dr. George C. Ruhland, 4130 Municipal Bldg., Washington.

FLORIDA: *Examination.* Gainesville, June 11. Sec., Mr. M. W. Emmel, University of Florida, Gainesville.

MICHIGAN: *Examination.* Detroit and Ann Arbor, May 13-14. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing 15.

MINNESOTA: *Examination.* June and Oct. Sec.-Treas., Dr. Raymond N. Bieter, 105 Millard Hall, Univ. of Minnesota, Minneapolis.

OREGON: Portland, June 18, Sept. 3 and Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

SOUTH DAKOTA: Vermillion, June 3-4. Dr. G. M. Evans, 310 E. 15th St,. Yankton.

TENNESSEE: Memphis, July 8-9. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis 3.

WISCONSIN: Milwaukee, June 4. Sec., Prof. W. H. Barber, Ripon College. Ripon.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Smallpox: Right of School Board to Exclude Unvaccinated Child.—This was an action for an injunction to restrain the Barren County Board of Health and the Glasgow City Board of Education from enforcing a resolution each had passed requiring all school children to be vaccinated for smallpox or else be excluded from the city schools. From a judgment denying the injunction the plaintiffs appealed to the Court of Appeals of Kentucky.

The plaintiffs first insisted that there was not a case of smallpox in Barren or the surrounding county and that there had not been one for years and years, that there was no reasonable basis for the apprehension of an outbreak of the disease in the county and that therefore vaccination was unnecessary. The answer to this argument, said the Court of Appeals, appears in a prior Kentucky case (*Board of Trustees, etc. v. McMurtry,* 169 Ky. 457) where it was written that the health authorities are not required to wait until an epidemic exists before acting, but it is their duty to adopt timely measures to prevent one. While they may not harass the public by unreasonable or arbitrary regulations, such matters are left to their sound discretion rather than to the whims of laymen. It is too late, said the court, to start vaccinating to prevent the closing of schools after a case of smallpox appears.

The plaintiffs next argued that the school board was without authority to enforce the regulations of the health board requiring vaccinations. The State Board of Health adopted Rule 64 which reads: "No person shall become a member of any public or private school within the jurisdiction of this board as a teacher or scholar without furnishing a certificate from some reputable physician that he or she has become successfully vaccinated within seven years, nor shall such person be permitted to remain a member of such public or private school as a teacher or scholar without being vaccinated at least every seven years." The plaintiffs insist that the legislature has made no provision for the vaccination of school children, that Rule 64 was made by the State Board of Health under its general authority and that the school board was without power to enforce it. They are wrong, said the Court of Appeals. It is provided in the Kentucky statutes that all adults shall procure their own vaccination. Another section provides that all parents, guardians and other persons having the care, custody or control of any minor shall have the minor vaccinated for smallpox within twelve months after birth or after the minor comes under their care, custody and control. Still another section provides that all pupils admitted to the common schools shall comply with the lawful regulations for the government of the schools. Reading these sections together, said the Court of Appeals, we are convinced that the school board had the right to promulgate and enforce its own rules requiring compulsory vaccination of the children or it could enforce, in its own right, such a rule promulgated by either the county or state board of health.

The plaintiffs next contended that compulsory vaccination interferes with the constitutional rights of the children. Many cases, said the Court of Appeals, have held that the state has the authority to refuse children admission to the public schools until they are vaccinated. One of the plaintiffs, however, who was a chiropractor, also argued that his religious and conscientious belief prevented him from subjecting his children to vaccination by injecting foreign substances into the veins and that, consequently, to enforce the resolution of the school board compelling him to have his children vaccinated would interfere with his religious freedom. Religious freedom, said the court, embraces two conceptions, freedom to believe and freedom to act. The first is absolute, but in the nature of things the second cannot be. The constitutional guaranty of religious freedom, concluded the court, does not permit the practice of religious rights dangerous or detrimental to the lives, safety or health of the participants or the public. There may be no interference with the plaintiff's religious belief against vaccination, but he may not endanger the health of the community by refusing to have his daughter vaccinated.

Finally the plaintiffs contended that the two girls involved were not physically fit to undergo vaccination and that it would be detrimental to their health. The medical testimony in the record does not substantiate this claim, said the Court of Appeals. The preponderance of the medical testimony is to the effect that any child physically able to attend school can be vaccinated safely and without injury.

Accordingly the judgment of the trial court denying the requested injunction was sustained. *Mosier v. Barren County Board of Health; Stuart v. Barren County Board of Health, 215 S. W. (2d) 967 (Ky., 1948).*

Medical Motion Pictures

NEW MOTION PICTURE ADDED TO THE A. M. A. LIBRARY

Modern Surgery. 16 mm., black and white, sound, 700 feet (1 reel), showing time fifteen minutes. Produced in 1948 by The March of Time and released to Commercial Theaters under the title "The Case of Mrs. Conrad." Procurable on loan (Service Charge $2) from the Committee on Medical Motion Pictures, American Medical Association, 535 North Dearborn Street, Chicago 10.

This film depicts the story of a surgical operation from the moment the family doctor suggests hospitalization until the patient fully recovers and is discharged. Some of the newer aspects of medical procedure portrayed in the film are hospital plan benefits, preoperative rest, the work of the various medical personnel who aid in the physical examination, recording of the medical history, laboratory tests, electrocardiograms and roentgen examinations. The role of the anesthetist before, during and after the operative procedure is well illustrated. The final scenes show early ambulation and the patient discharged to her home.

Physicians called on to address lay audiences such as service organizations, parent-teachers' associations and other such groups may find this film a useful adjunct in their lectures.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Heart Journal, St. Louis

36:801-986 (Dec.) 1948

*Report of Committee for Evaluation of Anticoagulants in Treatment of Coronary Thrombosis with Myocardial Infarction: Progress Report on Statistical Analysis of First 800 Cases Studied by Committee. I. S. Wright, C. D. Marple and Dorothy F. Beck.—p. 801.

*Some Effects of Quinidine Sulfate on Heart and Circulation in Man. M. I. Ferrer, Réjane M. Harvey, L. Werkö and others.—816.

II. Correlation of Electrocardiographic and Pathologic Findings in Large Anterolateral Infarcts. G. B. Myers, H. A. Klein and T. Hiratzka. —p. 838.

Experimental Study of Acute Pulmonary Arterial Obstruction, with Special Reference to Precordial Electrocardiogram. J. Flasher, H. E. Essex and Arlie R. Barnes.—p. 882.

Oxygen Content of Coronary Venous Blood as Affected by Anoxia and Cytochrome C. J. E. Eckenhoff and J. H. Hafkenschiel.—p. 893.

Portable Electrical Manometer Suitable for Continuous Indication of Peripheral Venous Presures. A. A. Pollack and E. H. Wood.—p. 899.

Can Longitudinal Anatomical Axis of Ventricles be Estimated from the Electrocardiogram? A. Hyman, R. B. Failey and R. Ashman.—p. 906.

Evaluation of Precordial Leads of Electrocardiogram in Obesity. H. L. Jaffe, E. Corday and A. M. Master.—p. 911.

Electrocardiographic Changes During Anthiomaline Treatment of Schistosomiasis. R. M. Suárez, S. Santiago-Stevenson and F. Hernández-Morales.—p. 923.

Anticoagulants in Coronary Thrombosis.—Wright and his associates summarize the results obtained by a preliminary statistical analysis of the first 800 cases studied by the Committee for the Evaluation of Anticoagulants in the Treatment of Coronary Thrombosis with Myocardial Infarction: The incidence of deaths and of both thromboembolic and hemorrhage complications has been compared in a "control" series of patients treated by conventional methods alone and in a series of "treated" patients who received anticoagulants (dicumarol,® heparin or both) in addition to conventional therapy. It was found that patients treated with anticoagulant therapy in addition to the conventional forms of therapy experience a death rate and incidence of thromboembolic complications during the first six week period following an attack which are markedly lower than those experienced by patients treated solely by conventional methods. Anticoagulant therapy should be used in all cases of coronary thrombosis with myocardial infarction unless a definite contraindication exists. In the absence of other hemorrhagic states, the hazards from hemorrhage due to anticoagulants are not sufficient to contraindicate their use in the treatment of coronary occlusion providing there are facilities for adequate laboratory and clinical control.

Quinidine Sulfate and Circulation.—Ferrer and his associates discuss the effect of quinidine sulfate on the circulation in subjects with an essentially normal cardiovascular status and in patients with heart disease. Quinidine sulfate, 0.8 Gm. by mouth, was given in a single dose on the basis that this amount represents the maximum effective single oral dose of this drug. An extensive investigation of the circulatory hemodynamics was carried out in 20 patients, by means of the technic involving catheterization of the right side of the heart. Clinical investigation of the blood pressure alone was undertaken in 21 subjects. A fall in arterial blood pressure was found in 12 of the 18 normal subjects, an incidence of 66.7 per cent. The results obtained in 5 of these 12 patients indicate that the fall in arterial blood pressure was unaccompanied by any change in cardiac output or right ventricular pressure. Eighteen of the 23 patients with cardiovascular disease showed a fall in arterial blood pressure, an incidence of 78.3 per cent. It was apparent, however, that in these cardiac patients the subsequent readjustments in the circulation were dependent on the physiologic status of the patient. In patients with normal cardiac output, no change in this determination was measurable. Patients with low cardiac outputs and elevated right ventricular systolic pressures responded with a shift toward more normal values. It is suggested that the fall in arterial blood pressure following use of quinidine is due in large measure to peripheral vasodilatation. Some evidence for an effect on the myocardium is also presented.

Low Sodium or Rice Diet in Hypertension.—Rosenberg and his associates treated 7 hypertensive patients with a low sodium diet that was adequate in protein; 4 received the rice diet in addition to this; 1 had the rice diet alone, and in 1 patient observations were discontinued because he did not adhere to the diet. Four of 7 on the low sodium diet experienced a statistically significant fall in blood pressure; in 3 there was no change. Of 5 patients on the rice diet 3 showed statistically significant falls in both systolic and diastolic pressures, but only 1 to a normal value. The effect of the rice diet was only slightly greater than that of the low sodium diet. Although there was a fall in blood pressure in 5 of the patients studied, there was no relief of symptoms. Although the number of patients studied is small it is believed these changes were not of sufficient magnitude to warrant the routine use of this type of therapy in the management of essential hypertension.

Sponge Biopsy in Cancer Diagnosis.—After citing certain shortcomings of the vaginal smear technic, Gladstone presents a method which represents a simplified technic for obtaining living cells and clumps of cells in a form suitable for paraffin embedding directly from the tissue suspected. It consists essentially of rubbing a piece of sponge over the suspected tissue. Fluid and cells exuding from the tissue will be absorbed by the sponge which is then dropped into a small bottle of 10 per cent formaldehyde or other fixative. The sponge and its absorbed contents are then treated as one would treat a block of tissue for embedding, cutting and staining (hematoxylin and eosin) prior to microscopic examination. A sponge of protein composition such as gelatin is particularly suitable for this purpose. The author uses an absorbable gelatin sponge 2 by 2 by 5 cm. It is clamped along one margin by a surgical sponge forceps. After insertion of a vaginal speculum and visualization of the cervix the sponge is rubbed firmly over the mucosal surface and mucoepithelial junction of the external os. The author has examined eighty-eight slides from sponges rubbed over tumorous and nontumorous tissues. In general the tumor cells when present are so numerous and so readily recognized as to permit prompt diagnosis. The cells are well preserved and well fixed. They show the characteristic changes.

Beryllium Pneumonitis.—Dutra shows that exposure to dust and fumes containing beryllium has resulted in a number of cases of pulmonary disease. These are of two fairly distinct clinical types: an acute pneumonitis and a protracted pulmonary fibrosis and emphysema. In acute pneumonitis there is a boggy, generalized consolidation of lobes, simulating the gray hepatization in lobar pneumonia. Microscopically, there is a diffuse intra-alveolar exudate composed of large mononuclear phagocytes (septal cells) and edema fluid. Intraseptal lymphocytes and plasma cells are also fairly numerous. With chronic pulmonary fibrosis (granulomatosis) the lungs have been voluminous and emphysematous. Many fine nodules were scattered diffusely throughout the lungs, and the right ventricle of the heart was enlarged. The granulomas which are typical of beryllium disease are formed in part within alveolar spaces by the organization of exudate and in part within the septal and peritruncal connective tissues. They are comprised of central regions of fibrinoid material or granular debris, and the central regions are surrounded by a peripheral zone of fibrosis in which there is an infiltration of lymphocytes and plasma cells. The centers of the granulomas are occasionally occupied by giant cells of the Langhans' type. There are conchoidal bodies in most cases, sometimes within giant cells, sometimes lying free in debris or in fibrous tissue. Granulomas similar to those of the lungs have been found in the skin and subcutaneous tissues into which beryllium oxide or phosphors have accidentally been introduced.

Operation in Carcinoma of Left Half of Large Bowel.—McNealy and Wolfe say that the aim of each operation for carcinoma of the large bowel is to remove completely the tumor and adjacent tissues that might be involved. Restoration of bowel continuity and sphincter control should be provided when possible, but under no circumstances should one sacrifice completeness of dissection and resection. In those portions of the left half of the large bowel that are easily accessible a wide resection with primary anastomosis is the most desirable operation. However, even a mild degree of obstruction and consequent distention are contraindications to this operation. Retention of barium in the colon following previous roentgenologic examination makes primary anastomosis extremely hazardous. If there is evidence of barium or fecal material in the colon, the operation is postponed until the bowel is emptied of its contents. If the bowel can be decompressed by enemas, chemical biostatics will reduce the bacterial flora to a level compatible with primary healing. In addition to the local factors the vitamin level and the efficiency of the liver are important. An adequate blood supply can usually be assured if one is careful to divide the mesentery in a manner that will not impede the free flow of blood to the cut ends of the bowel. The crushing of these ends which are later to be used in the anastomosis is unsafe. There are patients who are not suitable for resection followed by primary anastomosis. Patients who have remained obstructed until their condition has assumed emergency proportions may require immediate colostomy. The authors oppose the Mikulicz procedure when the patient's condition is complicated by distention of the colon. Carcinomas located at or near the peritoneal reflection and those below this level are probably best managed by a one stage abdominoperineal resection. If obstruction exists, a primary colostomy is necessary. In the authors' 266 cases the abdominoperineal operation was employed in 188, primary anastomosis in 50 and permanent colostomy in 18 cases. The Mikulicz operation was used in only 1 patient; 9 patients refused operation. The authors have tried to adapt each operation to the requirements of the individual patient.

Intestinal Extract in Ulcerative Colitis.—Entertaining the possibility that nonspecific ulcerative colitis is due to a deficiency of an intrinsic protective factor which is present normally in the bowel mucosa, Haskell and Friedman used extracts of hog's intestinal mucosa in patients with this disorder. After their studies had been in progress for some months they learned that similar experiments were being made in England. To date Haskell and Friedman have used the intestinal extract in 71 patients, but in most of them the time interval which has elapsed since treatment was begun has been too short to permit evaluation of the results. The present report is, therefore, restricted to a study of 27 patients who have been under treatment for a minimum period of one year. Diagnosis was established on the basis of clinical history, sigmoidoscopy, roentgenologic bowel studies, examination of the stools and repeated stool cultures which were negative for pathogenic organisms. The same criteria were used for evaluating the results of treatment. Thirteen of the 27 patients showed both symptomatic and sigmoidoscopic improvement; in 8 others improvement was evident only on sigmoidoscopic examination and 3 others showed only symptomatic improvement; in the remaining 3 patients no improvement was noted. After remission of symptoms, withdrawal of the intestinal extract or substitution of a placebo resulted in relapse, with remission occurring again on resumption of treatment. It is probable that sustained improvement can be maintained only by continued administration of the extract.

Surgical Treatment of Ulcerative Colitis.—Fansler and Frykman believe that there is no yardstick which will definitely indicate when to abandon conservative measures and resort to surgical treatment in ulcerative colitis. The more recent trend is toward earlier and more frequent surgical intervention. Operations found most useful are (1) ileostomy alone; (2) ileostomy with complete colectomy, with or without removal of the rectum; (3) partial or complete colectomy with anastomosis of the ileum to the remaining segment of colon or rectum, and (4) vagotomy. Until recently surgical treatment of ulcerative colitis has been directed entirely toward the intestinal tract. In October 1946 Dennis at the University of Minnesota performed a transthoracic vagotomy for this condition. In March 1948 he reported 19 cases in which he had done a bilateral vagotomy for the treatment of idiopathic ulcerative colitis and regional enteritis. Of this group 73 per cent had either shown definite improvement or had become entirely asymptomatic. One of the authors, Fansler, made proctoscopic observations on a considerable number of the patients in the series operated on by Dennis and was so impressed that the procedure was recommended to several patients under their care. Transthoracic vagotomy was done in 4 of their patients. One patient appears to be cured, 2 show improvement and the fourth shows moderate improvement. Considerable time must elapse before it can be determined whether complete resolution of the chronic inflammatory process will occur. In general vagotomy seems more applicable in the acute and early chronic types of the disease before irreparable damage to the colon has occurred. In the cases of intractable disease in which the colon has been converted into a thickened, fibrotic tube lined chiefly with infected granulation tissue and in those showing evidence of polyp formation, the methods of intestinal surgery are the procedure of choice.

Dihydrostreptomycin.—According to Hobson and his associates dihydrostreptomycin is an antibacterial agent which has been prepared by catalytic hydrogenation of streptomycin. It differs from the latter structurally only in having a hydroxyl instead of a carbonyl group in the streptobiosamine portion of the molecule. The present study indicates that the toxicity of dihydrostreptomycin differs significantly from that of streptomycin. Both drugs may cause a variety of toxic reactions in human beings when administered over long periods. Dihydrostreptomycin was found to be less neurotoxic than streptomycin. In the patients treated in this study, evidence of vestibular damage appeared later and less uniformly with 5.0 Gm. of dihydrostreptomycin daily than it has in patients given 3.0 Gm. of streptomycin daily. Dihydrostreptomycin is also well tolerated by patients who are hypersensitive to streptomycin. Five patients were given the dihydro derivative in doses up to 2.0 Gm. daily without untoward reaction at times when hypersensitivity to streptomycin was readily demonstrable. In the 12 cases of pulmonary tuberculosis reported here, the therapeutic results were judged to be as good as those that have been obtained with streptomycin. Resistant strains of tubercle bacilli have emerged during treatment with dihydrostreptomycin in the same fashion as with streptomycin. Highly resistant strains, not inhibited by 1,000 micrograms per cubic centimeter of one compound, are similarly resistant to the other. Dihydrostreptomycin should prove to be useful in the treatment of patients unable to tolerate streptomycin because of hypersensitivity. The lower neurotoxicity of the dihydro derivative also suggests that it is preferable to streptomycin for the treatment of patients who require large doses or long courses of the antibacterial agent.

Clinical Use of Dihydrostreptomycin.—Hinshaw and his associates present clinical observations on 14 patients who were treated with dihydrostreptomycin and all but 1 of whom had some form of tuberculous process, including tuberculous meningitis, miliary tuberculosis, postoperative tuberculous empyema and pulmonary tuberculosis. The authors gained the impression that dihydrostreptomycin is much less toxic than streptomycin when given in comparable doses for similar periods. It may be administered to patients in doses of 2 to 3 Gm. per day for sixty days, or perhaps longer, with little danger of producing impairment of function of the organs of equilibration. The fact that dihydrostreptomycin may be administered to some patients who are allergic to streptomycin and the fact that eosinophilia has not been observed in this series of treated patients may be important. The only unfavorable attribute of dihydrostreptomycin noted was irritation of the tissues at the site of injection. The irritation is appreciably more severe than that produced by streptomycin. Intrathecal injection of dihydrostreptomycin is not recommended for the treatment of meningitis unless a less irritant form of the drug can be produced. Patients with meningitis treated with dihydrostreptomycin might be given purified streptomycin intrathecally. The authors feel that the series of patients reported on here is not sufficiently large, nor is the period of observation sufficiently long, to have revealed all of the possible toxic potentialities of dihydrostreptomycin.

Sanatorium Treatment and Collapse Therapy.—The data for this investigation by Simmonds and Martin were derived from the records of 3,833 persons discharged from Clare Hall County Hospital during the nine years 1937 to 1945. These patients were admitted from the County of Middlesex and were mainly derived from industrial working class or "black-coated" workers and their families. The authors say that the results of treatment in the present series appear to show definite improvement over earlier comparable series of patients in England. This improvement is particularly shown in the group in whom collapse treatment was applied more extensively than in earlier years (approximately 70 per cent). The chance of survival is almost doubled by such treatment. Collapse treatment is the most valuable method at present known for insuring sputum conversion in "positive" patients, and for their recovery, as estimated by living for five years. Such treatment should be employed as thoroughly as possible, but maintained only when the collapse is made efficient.

Penicillin Treatment of Streptococcal Pharyngitis. J. P. Loge and E. D. Kilbourne.—p. 698.

Pathogenesis of Rheumatic Fever.—According to Kerr, there is abundant evidence that micro-organisms of the Streptococcus group are the etiologic agents which initiate a train of reactions resulting in the lesions characteristic of rheumatic fever. The seasonal occurrence of outbreaks of rheumatic fever at the time of year when streptococcus infections are prevalent lends support to the view that these organisms are causal factors. The silent period of some days to two or three weeks following the pharyngeal symptoms is one of the characteristic features of rheumatic fever. A similar pause is observed in scarlet fever before the renal, articular and cardiac manifestations appear. It is during this period that immune mechanisms are set in motion. An increased antistreptolysin titer is almost constantly observed. The clinical manifestations of varying severity then make their appearance in the synovial membranes and other connective tissues, in the cardiac valves, myocardium and pericardium, in the skin, brain, lungs and kidneys, with symptoms and signs peculiar to the organs and structures concerned. The immunologic processes which are involved in rheumatic fever and scarlet fever are not completely understood. There are, however, some clues which shed light on the problem and point the way for future study. Kerr mentions some of these clues, giving particular attention to Cavelti's search for autoantibodies in the serum of patients with active rheumatic fever. These studies suggest that the etiologic agent, presumably the hemolytic streptococcus, by injury to, or in combination with, the connective tissues of the body produces autoantibodies which act in vivo to bring about lesions which may be progressive or may be reactivated by repeated exposure to the same organism. It is assumed that after the silent period the "trap is sprung," presumably by antigenic substances which are developed by the tissues of the host and perhaps are in the nature of autoantibodies.

Chloromycetin in Rocky Mountain Spotted Fever.—Pincoffs and his co-workers report on chloromycetin which was prepared from liquid cultures of a Streptomyces shown to possess antibacterial activity. It is a crystalline substance relatively insoluble in water, but well absorbed from the gastrointestinal tract. The toxicity of the drug is apparently low. When given intravenously in mice and intramuscularly in dogs, chloromycetin is well tolerated in single doses up to 100 mg. per kilogram of body weight. Reports on the therapeutic use of chloromycetin orally in man have indicated the absence of toxic manifestations. The authors present results obtained with chloromycetin in 15 proved cases of Rocky Mountain spotted fever. Chloromycetin was administered orally in the form of tablets of 0.25 Gm. No fatality resulted among the 15 patients, although 4 had a virulent form of the disease. The evidence presented indicates that the new antibiotic chloromycetin, in addition to its previously demonstrated effectiveness in the treatment in man of scrub typhus and of epidemic typhus, is also effective in the treatment of Rocky Mountain spotted fever. Further studies will be required to determine whether murine typhus, Q fever and other members of the family of rickettsial diseases will yield in similar fashion to this therapeutic agent. The questions of the proper dosage of the drug, and particularly the number of days during which its administration should be continued, are still undetermined. In the present small series of cases no recurrence of the disease was observed when the drug was discontinued after twenty-four hours of normal temperature.

Calcific Disease of Aortic Valve.—The material studied by Hultgren consisted of 100 hearts from unselected, consecutive necropsies made on adults in the department of pathology of the Stanford University School of Medicine. Calcium deposits were observed in the aortic valves in 46 hearts. In 34 of these hearts no gross or histologic evidence of valvular rheumatic disease was found. Such calcium deposits were found more frequently in older persons, and their size and number were greater in the higher age groups. Microscopic examination of the valves revealed that in most cases there were alterations of the dense connective tissue at the base of the leaflet and to a lesser degree in the fibrosa of the leaflet itself. These alterations resembled degenerative processes occurring elsewhere in the vascular system. Calcifications were found most frequently in these areas, suggesting that the deposition of calcium is part of the same degenerative process. The findings suggest that in many cases calcifications of the aortic valves are a result of a purely degenerative process and do not have a rheumatic origin.

Pulmonary Alveolar Lining in Bronchiectasis.—Watts and McDonald say that although under ordinary circumstances the alveoli of the adult do not have a visible lining of cells, a discernible lining of cells may be associated with many pathologic conditions of the lungs. This perplexing situation is largely responsible for the many discrepant accounts of the normal histologic structure of the pulmonary alveolus. The authors report the results of a detailed study of the pulmonary alveolus made in cases of bronchiectasis. Fifty human lungs that had been removed surgically because of bronchiectasis were taken indiscriminately from the pathology museum of the Mayo Clinic. In 4 of the 50 cases of bronchiectasis the lungs presented other pathologic processes as well (abscess in 2 cases, empyema in 1 case and tuberculosis in 1 case). The authors found that in bronchiectasis the pulmonary alveoli commonly had a visible continuous lining of cells. These cells were derived from two sources: (1) from bronchial epithelial cells and (2) from the pericapillary cells of the alveolar wall. The latter origin was far more frequently encountered than was the former. The appearance of the cells of alveolar origin differed from that of the cells of bronchial origin and, in addition, the cells of alveolar origin were frequently phagocytic even after they had assumed a typical epithelium-like structure and arrangement. Although no conclusions were drawn regarding the entodermal or mesenchymal nature of the lining cells of alveolar origin, it was conjectured that their parent cell also gave rise to the alveolar phagocyte.

Lenticular Opacities Produced by Microwave Irradiations.—Richardson and his co-workers say that the development of cataract as the result of irradiations is not a new discovery, but investigators in the past have been concerned chiefly with the effects of infra-red, ultraviolet and roentgen irradiations. Sinus disorders have been treated extensively by the use of short wave diathermy for a number of years and have proved safe when used as prescribed. With the production of a new microwave generator which propagates 12.25 cm. waves, a new band of the electromagnetic spectrum has been offered for medical therapy. The authors investigated both the immediate and the delayed effects of microwave irradiations on the eye. A direct single exposure of rabbit eyes to 12.25 cm. microwaves at 5 cm. distance for fifteen minutes with 100 watt power output resulted in cataractous lenticular opacities after a delay of three to nine days. A series of repeated exposures of a smaller magnitude resulted in cataractous lenticular opacities after a delay of two to forty-two days. Four rabbits irradiated for seventeen to twenty minutes at 5 cm. distance revealed cataract formations immediately after the irradiations. Since other workers have shown that the microwave generator serves an adequate purpose in medical therapy by inducing temperature increases in selected areas of the body, the findings in this report should not discourage its employment in those areas. Precaution should be taken in the future with regard to irradiations in the region of the face and orbit.

Treatment of Painful Stiff Shoulder.—Meyerding and Ivins present clinical observations on 150 consecutive cases of stiff painful shoulder, in which manipulation with patient under anesthesia, surgical excision of calcified plaques or bursas, injection or needling was performed at the Mayo Clinic during the years 1942 through 1946. The duration of symptoms varied, but in 65 it was of less than a year. Roentgenographic examination revealed calcification in 59 cases and osteoporosis in 34. Since the evidence of calcification depends on the degree of deposit, calcification doubtless was present in more cases. Pain, stiffness and local tenderness were the characteristic symptoms, and they often followed some exertion, such as gardening, painting and washing walls. The pain was usually intermittent. The patient with the acute stage of the disease or with intense pain, local tenderness, slight fever and the arm maintained at the side for protection may be treated for a few days by rest in bed, local application of heat, increased intake of fluid, maintenance of elimination and traction, together with administration of anodynes. Abduction should be encouraged, and conventional diathermy and roentgen therapy may be included, after which patients often are relieved. The authors discuss the treatment to be employed in the subacute and recurrent attacks. In 69 of the 150 cases manipulation with the patient under anesthesia was performed; in 32 additional cases manipulation with injections of procaine hydrochloride into the suprascapular nerve was used; in 31 a needling operation was performed, to pierce and break up the calcareous deposits, and in 18 surgical excision of the calcareous masses was performed. Forty of the 150 patients received roentgen therapy in addition to other treatment, some of them prior to admission at the clinic. Acute lesions have proved more amenable to roentgen treatment than have the more chronic lesions. The authors present detailed reports of 9 patients to illustrate certain points in diagnosis and treatment. By following the procedures outlined in this paper, satisfactory functional results have been obtained in 85 per cent of the cases.

Reconstruction Following Irradiation Injuries.—Greeley says that although in comparison with the vast number of treatments with roentgen rays and radium the actual total of injuries is relatively small, to the plastic surgeon who sees patients with such injuries the number seems to be too large. Some of these lesions result from incidental reactions following treatment of deep lesions, while many others arise in the hands of untrained or inexperienced operators. Typical symptoms of chronic roentgen ray dermatitis are severe pain, itching and ulceration. Frequently the symptoms are so severe that they produce addiction to morphine. After surgical excision relief is dramatic. Permanent cure can be anticipated as soon as the defect created by the surgical excision has been closed. When one considers the avascularity produced by an irradiation injury it becomes apparent that there is little place for conservative management, in spite of enthusiastic reports given by the advocates of local applications of radon paste or the Aloe vera leaf. A permanent cure can be anticipated only when all of the damaged tissue has been excised back to an area of good blood supply. If this excision is not wide enough, reconstructive operations will fail, and later degeneration may occur around or below the site of the original excision. The severe pain and itching are relieved as soon as the damaged tissues have been excised. The remaining problem is one of reconstruction of the cutaneous defect created by surgical excision. A few defects may be closed by primary suture after adequate undermining of the border flaps, so that they can be mobilized without tension, but the majority of the cutaneous defects will, because of their nature and size, have to be covered by a skin graft or skin flap.

Ureterointestinal Implantation.—Hinman reports 31 patients with exstrophy of the bladder who have had ureteroenterostomy. Six patients died. Four deaths were surgical, 2 from acute peritonitis five and eight days after transplantation by the Coffey method before the days of succinylsulfathiazole. A third patient, aged 4 months, died two days after operation, and necropsy revealed extensive necrosis of the ends of both ureters with leakage. Between 1 and 2 years is now thought to be the optimum age for operation. The fourth patient, a child aged 16 months, died from an anesthetic. With improved methods of preparation and technic the surgical risk may be estimated conservatively for this group to be well under 5 per cent. The other deaths occurred respectively seven years and nine months after operation, in the former probably following an attack of recurrent pyelonephritis, in the latter case from shock following cystectomy and plastic repair of the external genitalia. Of the 25 patients with exstrophy who are living, 18 have survived more than six years, 7 of these more than ten years and 4 more than fifteen years, since the operation. Of these 4, 3 have been in good health twenty-eight years, eighteen years and fifteen years respectively. The fourth was as well as the others for twenty years and had married, but for some unknown reason began to have attacks of pyelonephritis. Another patient surviving twelve years had to have permanent nephrostomy ten years after operation, and still another patient ten years after ureteral transplantation shows definite hydronephrosis, which already was present before the operation and which may require nephrostomy later. Some of the remaining 19 patients have occasional attacks of fever readily controlled by the modern urinary antiseptics, but the majority of the 19 patients are in good health. A long term survival in good health can be expected after successful ureteral transplantation into the rectosigmoid, and the risk of the method does not contraindicate its use in the radical treatment of cancer of the bladder.

Electrocardiogram in Rheumatic Fever.—According to Kahn and his co-workers, in active rheumatic fever each segment of the electrocardiogram may be altered and the rhythm may be disturbed. By far the most common change is an increase in the P-R interval, which may occur in varying degrees up to complete dissociation of auricle and ventricle. With the return to normal of tachycardia, temperature, joint symptoms and blood findings, the P-R interval in most cases also returns to normal. In a few cases it may persist for weeks and months and permanent damage of the conducting tissue must be suspected. The change in the P-R interval varies with the acuteness of the disease process, and this applies also to the frequency of changes in the QRS-T or ventricular portion of the electrocardiogram in rheumatic fever. Gross widening of this segment beyond the normal of the person under observation may be considered important as would distinct shifting of the electrical axis. Elevation or depression of the S-T portion when marked or changing from time to time in serial observations or when associated with changes of the T portion is definitely important. T wave changes such as depression, diphasic character or inversion are in general an indication of myocardial or pericardial change. The most important arrhythmia occurring during the course of rheumatic fever is auricular fibrillation. Not all patients with rheumatic carditis, even when the disease is severe, show electrocardiographic changes. Pronounced electrocardiographic changes can occur without clinical evidence of disease. Taking of frequently repeated electrocardiograms is emphasized for the detection of cardiac involvement in rheumatic fever. The electrocardiographic changes in rheumatic fever are not specific for this disease, and consequently a certain amount of caution is necessary in drawing conclusions from electrocardiographic changes. In most cases of rheumatic fever the diagnosis is readily apparent on clinical grounds. The electrocardiogram is altered so much more frequently in rheumatic fever than in most diseases which might simulate it that the presence of a distinct change in the electrocardiogram may be looked on as a point indicative of this disease.

Nitrogen Mustard Therapy.—Wintrobe and Huguley describe the effects obtained with methyl-bis (beta chloroethyl) amine hydrochloride, also called nitrogen mustard, in 102 patients. They included 32 patients with Hodgkin's disease, 11 with lymphosarcoma, 5 with reticulum cell sarcoma, 37 with leukemia and 17 with miscellaneous disorders. A palliative effect on adenopathy, fever, bone pain, splenomegaly and various other clinical symptoms has been observed in many patients with Hodgkin's disease, lymphosarcoma and leukemia. Nitrogen mustard produced remissions in a number of patients with Hodgkin's disease who were considered to be "roentgen ray resistant." Toxic manifestations of nausea and vomiting were observed in most patients after administration of nitrogen mustard. Nitrogen mustard therapy frequently resulted in a decrease in leukocyte count with lymphocytopenia and granulocytopenia. This was often accompanied by a variable decrease in red cells and a decrease in platelets. After the initial decrease in blood elements, an increase in red cells, even to complete disappearance of anemia and of thrombopenia, resulted in those patients responding favorably. In leukemia, a fall in the leukocyte count was often followed by a decrease in anemia or its complete disappearance. Ultimately nitrogen mustard therapy, like irradiation, proved ineffective, but ease of administration, effectiveness in some "roentgen ray resistant" cases and, rarely, a better tolerance for nitrogen mustard are advantages of nitrogen mustard as compared with roentgen ray therapy.

Association of Breast and Pelvic Disease.—Pierce and Slaughter subjected 100 women with breast disease to a gynecologic survey, including detailed histories, endometrial biopsies and vaginal smears. Eighty-three were found to have had or to have demonstrable pelvic disorders either in the past, at the first examination, or which developed while they were under observation. This did not include inflammatory lesions and changes resulting from obstetric wear and tear. The patients with benign breast lesions had more than twice as many pathologic changes in the female reproductive organs as had those with breast cancer. The incidence of pelvic disease in the entire group was nearly four times that of well women of comparable age. These results show the association of a cancer tendency in the two systems, so that some common etiologic factor might well be indicated. Clinically they point to the duty of the general surgeon to include a pelvic examination in the investigation of every woman with a breast lesion.

Epidemiologic Features of Cancer.—In applying the term "epidemiology" to cancer, Levin defines it as the study of what persons or groups of persons are most likely to have cancer and under what circumstances. A striking feature of cancer mortality in the past century has been its different course in the two sexes. Since 1915, any improvement in cancer diagnosis in females has been counterbalanced by improvement in cure rates, whereas in males the improvement in diagnosis was not so counterbalanced. Cancer of sites peculiar to each sex tended to increase in males and to decrease (with the exception of "ovary and fallopian tube") in females. The net result was a decrease in cancer mortality among females of about 6 per cent, while mortality in males increased during the same period by more than 8 per cent. Those concerned with providing improved diagnostic or treatment facilities for cancer are especially interested in its epidemiologic features, because such efforts will be more efficient to the extent that they are directed toward those persons who present the greatest risk of cancer. Discussing efforts directed toward the early discovery of certain forms of cancer the author mentions the use of vaginal smears to discover early uterine cancer. Here other factors, in addition to age, may prove useful as guides to what groups of women should be studied most intensively. Studies have shown that uterine cancer occurs more frequently among married than among single women; also, it is approximately three times more frequent among women who have had syphilis, and it is almost twice as frequent among Negro women as among white. Randall has demonstrated that women whose menopause is characterized by a period of menorrhagia suffer an increased incidence of carcinoma of the uterine fundus in later life. Case-finding procedures applied to the group that show higher than normal cancer incidence may be more effective.

Peritoneal Dialysis in Acute Uremia.—Pendino and Hampton report a case of uremia in which peritoneal dialysis was successfully employed. They conclude that the treatment of azotemia due to acute renal failure by peritoneal lavage is of practical value. Careful control of fluid and electrolyte balance and treatment of anemia and acidosis are necessary for successful peritoneal lavage, and changes in the perfusing fluid electrolyte concentrations may be required. Peritoneal lavage may be indicated in the treatment of uremia of acute renal failure due to: (*a*) heavy metal poisoning, (*b*) intravascular hemolytic reactions, (*c*) sulfonamide drug intoxication and (*d*) burns or crushing injuries.

Carotid Sinus Pressure and Atherosclerosis.—Goodman and Wassermann investigated the carotid sinus reaction as a test for arteriosclerosis. In employing carotid sinus pressure in a series of patients, three characteristic cardiovascular reactions were found: (1) bradycardia or cardiac standstill (cardioinhibitory effect), (2) a clear, sustained drop in blood pressure (vasodepressor effect) and (3) a combination of these two (mixed effect). The concept is advanced that the vasodepressor effect is dependent on the presence of atherosclerosis in the aorta and the great vessels in which is lodged the sinoaortic apparatus. A drop in the systolic pressure greater than 20 mm. of mercury and persisting over three minutes is considered to be indicative of atherosclerosis of the aorta and the adjacent great vessels, conveniently termed proximal (central) atherosclerosis. Under this heading are included the aorta, innominate, subclavian and common carotid arteries. Marked pulsations in these vessels were of such common occurrence in the cases in which results of carotid sinus pressure tests were positive that they proved to be of diagnostic importance.

Carbamates in Leukemia.—Skipper and his associates carried out toxicologic and hematologic studies on a series of carbamates consisting of twenty-seven compounds closely related to urethane. It was found that increasing the carbon chain of the ester group (from methyl through butyl) or substitution at the nitrogen position increased the toxicity of the resulting compound. Substitution of sulfur for the carbonyl oxygen increased the toxicity of the parent carbamates. Three variations of the ester group of urethane were accompanied by lessening of the leukopenic action of the molecule. A number of N-substituted carbamates with pronounced leukopenic action at nonlethal doses were uncovered. Potassium cyanate was not found to be leukopenic under the conditions of assay. Ethyl carbamate (urethane) was the only one of the series studied which caused a significant reversal of the differential leukocyte picture at two days after injection. Ethyl N-phenylcarbamate and N-carbethoxymorpholine tended in the direction of early preferential lymphocyte depression.

Streptomycin and Cochlear and Vestibular Mechanism.—Sirota and Jones present otologic observations on 16 patients who were treated with streptomycin for renal tuberculosis. All were given 1.8 Gm. of streptomycin daily in divided doses of 0.3 Gm. every four hours. Treatment was continued for 120 days, in all except 3 of the patients, in whom treatment had to be terminated after 66, 76 and 107 days, respectively, because of toxic effects. Symptoms like nausea, tinnitus and dizziness were recorded daily. Audiograms for both bone and air conduction and caloric tests were performed weekly. Follow-up studies were made in some cases up to a year after cessation of treatment. Nausea occurred in 10 of the patients. It varied in severity and did not persist after treatment with streptomycin was stopped. Dizziness or vertigo was the most frequent symptom, occurring in all but 1 of the patients. It usually commenced about three weeks after the onset of treatment and it persisted during a follow-up period of six to eleven months in 13 of the patients. There seems to be no correlation between the streptomycin blood level and the resultant toxic manifestations; the effect seems to be cumulative. Since it has been realized that the tubercle bacillus becomes resistant to streptomycin after a certain length of time, changes have been made in the dosage and the duration. At the authors' clinic patients are now treated with a daily dose of 1 Gm. for a maximum period of 42 days. It is hoped that this will reduce the undesirable side effects.

Meningoencephalitis Complicating Herpes Zoster.—Billingsley reports the case of a woman, aged 56, who had symptoms typical of encephalitis about seven days after the appearance of herpes zoster over the right thorax. The patient apparently suffered from encephalitis of the virus type. The sudden onset of delirium and light coma occurred without evidence of any preexisting or predisposing physical condition other than the herpetic rash. Focal neurologic signs were few. There was stiffness of the neck, with positive Brudzinski and Kernig reactions. The central nervous system seemed hardest hit in the conscious sphere or sensorium. This was characteristic in a percentage of the cases of herpetic encephalitis reported in the literature. Spinal fluid findings consisted of an increase in fluid pressure, increase in cells predominantly of the lymphocytic series, an increase in protein content and a moderate increase in spinal fluid sugar. In addition, the spinal fluid gave a zone 2 curve typical of meningoencephalitis.

Sanitary Studies of Automatic Washing Machines.—Gilson and Bartfeld state that since the war the New York Port of Embarkation has added to its activities the transportation and interim housing of dependent families of army personnel overseas. At port installations clothing is cleaned either by the port quartermaster laundry or by the dependents themselves, using automatic washing machines. The possible unsanitary nature of a public automatic washing machine is of general interest. Such equipment is commercially available for civilian use in many communities. The study of the public health aspects of such laundry facilities was undertaken. Home type automatic launderies were studied as to bacterial contamination. At the relatively low temperatures of the hot water supply, soap wash and repeated rinsing of clothing did not disinfect the clothing, and removal of the wash left the machine bacterially contaminated for the next user. The high and maintained temperatures of the quartermaster laundry did effectively decrease bacterial flora. Likewise, where similarly high temperatures were maintained in the automatic laundry machines, bacterial flora was equally decreased. In all cases the use of a dilute chlorine solution to wash out a laundry machine effected significant decontamination. It is recommended that laundry machines be equipped with a thermometer at the hot water inlet; also, where any question as to the adequacy of the hot water supply exists, a chlorine rinse should be used to insure bacteriologic decontamination.

Surgical Treatment of Mitral Stenosis.—Harken and his associates present the following preliminary classification of patients with mitral stenosis and of the different types of surgery: group A, patients with low fixed cardiac output—mitral valvuloplasty; group B, patients with normal cardiac output—artificial interatrial shunt; group C, patients with uncontrollable tachycardia or with anginal pain—cardiac denervation. Five operations have been performed. Mitral valvuloplasty was performed in 2 patients of group A, with 1 death. Artificial interatrial defects were produced in 2 patients of group B, with survival in each case. Denervation of the heart by bilateral removal of the inferior cervical ganglions and the dorsal first to the fourth in 1 patient of group C was followed by improvement. These cases are reported to indicate the ability of such patients to withstand operation. The evaluation of any long term benefits attributable to these procedures must rest on objective criteria gained from hemodynamic studies carried out before and after operation. Four principles of the surgery of mitral stenosis have been evolved: The operation should be performed without dislocation of the heart from the position of optimum function; the buttonhole opening of the stenotic mitral valve should be approached from the auricular side so that the funnel directs the cutting instrument toward the leaflet margin; surgical enlargement of the stenotic orifice should be so planned that there is a minimum burden from associated regurgitation ("selective insufficiency") and maximum restoration of valvular function ("valvuloplasty"); and in the presence of mitral obstruction or regurgitation, undue acceleration of the heart rate must be prevented. An unsuccessful attempt at producing "selective insufficiency" is presented. It is suggested that tachycardia was an important factor in the disastrous outcome. A case report is presented of the survival of a patient with mitral stenosis following an operation designed to produce "selective insufficiency" and "valvuloplasty" of the mitral valve. The authors suggest the need for more extensive and more effective valvuloplastic technics.

Misuse of Insulin.—Schreier and Sevringhaus say that in the older age group the use of insulin requires great care. They suggest that if diabetes develops in an obese person he should not be given insulin unless acetonuria coexists with the glycosuria. Weight reduction is paramount in such cases. Obesity is a prediabetic state in such persons. One may well permit the optimal weight to be established by managing the diabetes with a minimal diet without insulin. Out of 120 diabetic patients, weighing over 180 pounds (81.6 Kg.) each, 108 (90 per cent) were treated without insulin by one of the authors. Nine illustrating case histories are presented. The authors stress that the use of insulin in older, obese diabetic persons frequently becomes an easy substitute for education of the patient in the use of an appropriate diet. Consequently, as more food is taken, the insulin is increased because of continued glycosuria. The results include uneconomic use of insulin with possibly dangerous reactions. Obesity and hyperglycemia persist despite the insulin dosage; this probably could have been minimal or the patients could have done without insulin completely.

New Management of Poliomyelitis.—Smith and his associates regard the alleviation of pain and spasm as one of the major problems in the management of acute poliomyelitis. They believe that vasospasm is a defense mechanism of tissue response. When an irritable focus is established in the periphery, the organism reacts by vasospasm and exudate. These usually subside at the time healing is complete. However, if an irritative focus persists, a reflex arc producing pain and spasm is established. This arc may perpetuate itself through the internuncial pool and eventually involve the sympathetic motor neuron cells in the lateral horn. Interruption of the cycle of reflexes is, therefore, the method of choice. The results achieved in cases of trauma with the intravenous administration of procaine hydrochloride have indicated that the symptom complex of pain may be controlled in this way. The treatment described was used in 79 of 159 patients with poliomyelitis. Four patients were treated by the intravenous administration of procaine hydrochloride; 73 were treated with priscol hydrochloride® (2-benzyl-4, 5-imidazoline hydrochloride) and 2 with diethylaminoethanol. Acute pain was relieved in all cases within twenty minutes to eight hours, procaine hydrochloride giving the quickest and diethylaminoethanol the slowest response. Increasing relief of pain was obtained with succeeding administration to the point of complete relief, at which time the patients were discharged or transferred to orthopedic institutions. Although relief of pain and spasm was obtained in all cases, this report must be considered as a preliminary study.

Extragenital Chorioma.—Riopelle reports 1 case of extragenital chorioma associated with gynecomastia in a man aged 23. A positive Ascheim-Zondek reaction assisted in the clinical diagnosis. The patient died three weeks after his admission to the hospital. Necropsy established the diagnosis. Death was attributed to hemoperitoneum secondary to the rupture of a metastasis of the liver. The necropsy revealed a small teratoma in the right testicle which was not observed on clinical examination in spite of careful scrutiny. A latent testicular teratoma or a scar considered a vestige of an absorbed teratoma was observed on examination of the testicles in 5 cases of extragenital chorioma in man mentioned in the literature. The author's case is peculiar because it presented an embryonal teratoma with cells resembling those of pure, differentiated chorioma rather than a simple scar or vestiges of an adult teratoma. This observation corroborates Prym's concept of a causal relationship between extragenital chorioma and the testicular lesion. It further suggests that extragenital chorioma in man might be reintegrated in the frame of tumors of the gonads. In the presence of a neoplasm of doubtful origin one should consider the possibility of a small malignant teratoma of the testicle and carry out a careful examination of this organ.

Nicotinic Acid in Chronic Glaucoma.—Monfette treated with nicotinic acid 2 women aged 55 and 56 respectively who had chronic glaucoma. This vasodilator has been employed by Gallois in France for twelve years with satisfactory results in cases of glaucoma in which the intraocular pressure did not exceed 50 mm., particularly in patients with simple chronic glaucoma in the early stage in which the vascular lesions are not yet accentuated. Repeated vasodilator tests with intravenous doses of 2 to 3 mg. of the drug two or three times within one week must precede the treatment. Each test is followed by tonometry every fifteen minutes for one hour; each period of tonometry is preceded by measurements of the central visual acuity. Treatment consisted of 1 mg. of nicotinic acid in a teaspoonful of distilled water, 2 teaspoonfuls daily. In both patients vision was improved from 15/30 to 15/20 and tension was reduced from 26 to 20 in one case and from 25 to 19 in the other. Headache disappeared and so did the clouds before the patients' eyes. Although 2 cases are not sufficient to draw any conclusions, they seem to support Gallois's results.

Use of Hyaluronidase.—Henderson and his associates point out that it is frequently necessary, especially in wartime situations, to administer large amounts of fluids parenterally in a short time. After the atomic bomb blasts in Hiroshima and Nagasaki many patients had burns and the vomiting and diarrhea of radiation sickness and required supportive fluid therapy. Experienced medical personnel to administer fluids intravenously to all patients were not available. In such circumstances it would appear to be life saving to provide a technically simple method for the administration of plasma, dextrose and isotonic solution of sodium chloride. Hyaluronidase has recently been shown to accelerate the absorption of fluids given subcutaneously. Isotonic solution of sodium chloride can be given as rapidly as 100 drops per minute, or 400 cc. in an hour. The enzyme hyaluronidase hydrolyzes hyaluronic acid; the latter has been isolated from the viscid ground substance among the cells of the connective tissue. This ground substance acts as a barrier to penetration and the spread of foreign material and fluids in the connective tissue. The hydrolysis of hyaluronic acid by hyaluronidase therefore decreases the viscosity of the ground substance, permitting fluids to spread through the connective tissue, reach a greater capillary bed and be absorbed into the general circulation more readily. The technic of administration is simple; 0.02 mg. of hyaluronidase in solution is injected into the hypodermoclysis set.

Reactions from Penicillin.—According to Barksdale and his associates penicillin is capable of producing two types of reactions: (1) therapeutic shock as manifested by a Herxheimer reaction in syphilis, and (2) an allergic reaction. A Herxheimer-like reaction may also occur in nonsyphilitic diseases due to penicillin-susceptible organisms. Penicillin has an amino-acid-like structure and can act as an allergin just as any other protein. In cases of early syphilis treated with penicillin in a naval hospital, a Herxheimer reaction occurred in approximately 30 per cent of the cases. The occurrence of a Herxheimer reaction in early syphilis, however, is not an indication to discontinue the penicillin, but in late syphilis this reaction may be serious and even fatal. Urticaria is a frequent complication of penicillin therapy, and a mild exfoliative dermatitis is frequently superimposed on urticaria. Penicillin should not be used in fungous infections, because many cases of fungous infections are made worse by it. In 1 patient with fungous infection of the feet and stasis eczema a mild cellulitis later developed, and he was given penicillin. In turn urticaria, exfoliative dermatitis and hemolytic Staphylococcus septicemia developed, and the patient died. The history of this patient illustrates that treatment with penicillin in a previously sensitized patient is an extremely dangerous procedure. In the early days of penicillin therapy it was felt that the reaction rate was practically nil, but this cannot be substantiated now. The over-all reaction rate is approximately 8 to 10 per cent. The majority of these reactions are mild and transitory, but serious reactions can occur.

Syringe-Transmitted Jaundice.—The investigation presented by Morton was carried out in a venereal disease clinic where sterilization and intravenous technic were believed to be adequate and yet the incidence of jaundice was high. In boiling the syringes, it was noted that they were not always completely submerged in the boiling water and boiling times varied between ten and thirty minutes. Preparation of the injection material in a gallipot was carried out by a male orderly, using distilled water from an upturned flask. The charged syringe was handed to the medical officer who gave the injection and then returned the syringe to the orderly who washed it out in tap water and placed it in the "dirty bowl." It was observed that at the end of almost every session the number of syringes in the "dirty bowl" did not correspond to the total number of injections given during the session. It could be shown that all patients who contracted jaundice had at least three of their intravenous injections on a day when patients incubating the disease were having similar treatment. Possibilities for transference of hepatitis arise from the re-use of unsterilized syringes, the repeated use of the gallipot without sterilization, the drawing up of water from the "dirty bowl" into used syringes and the inadequate boiling of syringes. The handling by the orderly of both dirty and clean material cannot be overlooked. The author makes recommendations for proper sterilization.

Steatorrhea.—Fourman and his associates investigated fat excretion in 6 normal subjects, 4 patients with steatorrhea and 3 other patients. Fecal nitrogen losses were also determined in the normal subjects, and in some of the patients. The authors are of the opinion that balance studies, in which the output of a substance is compared with the intake, must usually be carried out for a period of at least twelve days. Fat excretions over four day collection periods have a coefficient of variation of about 30 per cent. The estimated probable upper normal limit of fat excretion in four days on a 70 Gm. fat diet was 23 Gm. Estimation of the four day excretion of fat is usually adequate for the diagnosis of steatorrhea, but where the effects of therapy are being studied the twelve day period must be used. Pancreatic steatorrhea is distinguished from steatorrhea of intestinal origin by the high fecal nitrogen loss. After treatment with folic acid as well as liver and yeast, fat absorption improved gradually to near normal in 1 patient with tropical sprue; there was no change in fat absorption after several months' folic acid treatment in 2 patients with idiopathic steatorrhea.

Potential Diabetes: Report of Thirteen Cases. Elizabeth A. Marshall. —p. 371.

*Injury to Brachial Plexus During General Anesthesia: Report of Four Cases. R. N. Sinclair.—p. 378.

Injury to Brachial Plexus During General Anesthesia.—Sinclair says that in a large general hospital during the past twelve months injury to the brachial plexus as a complication of operation under general anesthesia has occurred in 4 patients. In 3 patients the paralysis followed lengthy abdominal operations, all of which necessitated transfusions on the operating table. The transfusions in each case were given into a left antecubital vein, the arm being abducted to a right angle, and in each case the subsequent paralysis was left sided. On the fourth occasion the condition occurred in a patient undergoing radical mastectomy. The arm during the operation was held in extension and hyperabduction at about 135 degrees. The author believes that in these cases simple overstretching of the plexus with resulting ischemia of the nerve fibers was the main cause of damage. It is highly improbable that the plexus can be injured by "nipping" between the clavicle and the first rib. While it is true that when the arm is in a position of extreme abduction and extension the plexus tends to be compressed by the clavicle against the attachment of scalenus medius to the first rib, resulting lesion is caused primarily by tension on the plexus. The profound muscular relaxation associated with general anesthesia for abdominal surgery will favor the development of strain on the nerve cords, due to the loss of protective muscle tone from the musculature of the shoulder girdle. It is tempting to postulate that the use of curare to secure complete relaxation of muscles in 3 of the cases was a causative factor. The author does not accept this view, but prefers to stress the liability of the brachial plexus to injury when the patient is adequately relaxed by any form of general anesthesia.

Carriers of Typhoid Bacilli.—The studies reported by Vogelsang and Bøe of Bergen, Norway, were made on 417 patients with typhoid and on 1,055 patients with paratyphoid B observed over a period of twenty-eight years. Infections with Salmonella typhi were found to be considerably more serious than infections with Salmonella paratyphi B. The mortality from S. paratyphi B was low in children and young persons, but reached 5 per cent in patients over 30. Infection with S. typhi caused a mortality of 8.5 in children and rose to a rate of 16 per cent at higher ages. The percentage of temporary excreters was approximately the same for the typhoid and paratyphoid B patients—40 per cent were men and 60 per cent were women. The number of temporary carriers rose with the patients' age. Of the temporary carriers, only one tenth discharged the specific germ for more than four weeks after the cessation of the illness. After an interval of three months, it is exceptional for the carrier state to cease spontaneously. This interval may therefore be regarded as the dividing line between the temporary and the chronic carrier state. Of the patients with typhoid 3.3 per cent, and of the patients with paratyphoid B 1.9 per cent became chronic carriers. Thirty-one of them were fecal and only one was a urinary excreter. The chronic carrier state was extremely rare in children and young persons; it increased with age, 12 of the 32 chronic carriers being over 50. Eleven of these 12 were women, 5 being typhoid and 6 paratyphoid B carriers. Cholecystectomy was performed on 14 chronic carriers. In all the cases in which the carrier state had lasted for at least a year, gallstones and chronic cholecystitis were found, and the causal organism was obtained in pure culture from the gallbladder. The operation failed to counteract the carrier state in 1 of the patients.

Laboratory Anthrax.—Soltys' student became infected during or after a practical class in which he handled fixed and stained anthrax smears. A typical lesion developed on his chin at the site of a cut made during shaving, and virulent anthrax bacilli were isolated from it. The infection was mild and the student recovered. Since this accident suggested that despite fixation and staining one or other of the preparations contained viable organisms, it was decided to collect all anthrax slide preparations from the students in order to check this possibility. It was found that spores of Bacillus anthracis in films on slides may withstand the temperature of the Bunsen flame for 5 to 6 seconds. None of the common stains and methods of staining used in bacteriologic technic destroyed all spores in films on glass slides. Mercuric chloride solution (1 : 1,000) killed the spores of B. anthracis smeared on slides after these had been immersed for 5 minutes. Spores were also destroyed by a saturated solution of potassium permanganate; however, the permanganate rendered the slide unsuitable for further staining. Evidence was obtained that viable spores may escape into the atmosphere if spore suspensions of B. anthracis in saline solution are heated in open containers.

Intraperitoneal and Intratubal Penicillin.—Westman felt that before using penicillin in the fallopian tubes and the pelvic cavity it was necessary to ascertain whether penicillin causes any irritation which might bring about adhesions or other damage that would interfere with the migration of the ovum. In experiments on rabbits penicillin was injected directly into the pelvic cavity. In women penicillin was instilled via the fallopian tubes into the pelvic cavity with the instruments used in salpingography at different times before a laparotomy. Evidence was obtained that penicillin does not cause either toxic or chemical damage interfering with migration of the ovum and that it can be safely used in the local treatment of inflammation in the reproductive organs. This opens up new therapeutic possibilities of combating salpingitis and its sequelae.

Myanesin® in Tetanus.—Torrens and his associates say that the favorable effects obtained with myanesin® (3-ortho-toloxy-1, 2-propanediol) in 2 cases of tetanus by another observer induced them to publish a third case of tetanus in which myanesin® proved of great benefit. The action of myanesin® is similar to that of curare. The patient was a man, aged 62, whose bald head was cut when a glass jar fell from a shelf. A child had played with this jar in a garden, where horse manure had been piled the previous year. Four days later the patient's face began to feel tight, but spasms of pain did not appear for another eleven days. After hospitalization he was first given morphine. When a spinal puncture was to be done, relaxation was necessary and so myanesin® diluted in water was injected intravenously. Since this caused complete relaxation from all spasms, it was decided to continue myanesin® as a therapeutic agent. An initial intramuscular injection of 200,000 units of antitetanus serum was given, and penicillin, 30,000 units, was injected every four hours from May 28 to June 8. Myanesin® was given in 1 Gm. doses two or three times a day for nine days. The toal dose was 22 Gm. (7 Gm. intravenously and 15 Gm. intramuscularly). A few doses of morphine and barbiturates were also given, but these were insignificant. Myanesin® served to control the spasms. The patient was freed from pain for long periods and yet remained fully conscious and able to drink, owing to the relaxation of the masseter muscles. Nursing was made easy.

Surgery in Hemophilia.—Schiller and his associates report a 16 month old boy who had a flaccid paralysis of six days' duration. He came from a hemophilic family. The disorder was diagnosed as a compression of the spinal cord of uncertain origin. Laminectomy was decided on, because decompression seemed the only possible treatment if the child were ever to walk again. The lowest five thoracic and the second lumbar laminas were removed. The dura was blue and tight. When it was opened, clot bulged through the incision, but it nowhere extruded spontaneously, being too solid. In places the clot was up to 15 mm. thick. The cord was severely flattened below the lumbar enlargement, but it assumed its normal shape after the clot had been removed. The paraplegia was partly cured after the operation. Hematorrhachis is one of the rarest complications of hemophilia and is usually fatal if not dealt with surgically. The surgical risk in hemophilia can be greatly diminished by giving small daily blood transfusions, continued irrespective of the hematologic findings until the wound has healed. Pressure on a vital organ presents the greater danger to the hemophilic patient.

*Acute Nephritis. Study of Its Clinical Aspects Especially with Regard to Prognosis. J. Øster.—p. 25.

Acute Nephritis.—Øster says that acute nephritis, like rheumatic fever, is an *allergic disease which occurs after infection predominantly with hemolytic streptococci and may take a* chronic course. The joint disorders of transient kind in many cases also suggest a disorder related to rheumatic fever. The disease most often occurs in younger persons, which is explained by the frequency of infection with hemolytic streptococci in that age group. Of his 243 cases, representing all forms of acute nephritis, 81.8 per cent were in persons under 25. In 74.1 per cent of the cases infection of the upper respiratory tract preceded the nephritis. The maximum incidence was in the winter. Familial occurrence was seen twice. Three patients (1.2 per cent) died in the acute stage. The further fate of 137 of the 191 patients is known. Follow-up from five to twenty-four years after the acute stage showed that 12 had died, 8 of them from uremia. Eighty-nine and five-tenths per cent were well, and 3 patients had chronic nephritis. Three had orthostatic proteinuria and in 14 the blood pressure was increased but the kidneys were sound. In all but 3 of the patients who had died or had chronic nephritis, insidious onset and protracted course without tendency to recover during hospital treatment were so evident that postinfectious nephritis with sudden onset and regular course is believed to be a distinct entity with good prognosis, clinically and prognostically in definite contrast to the nephritis with insidious start, which from the first tends to become chronic.

Clinical Observations on 687 Cases of Cholera.—Tao and his associates report a study of 687 cases of cholera treated in a Shanghai hospital during an epidemic of cholera in the summer of 1946. The ages of the patients ranged from 3 to 77 years. The onset of the cholera was usually abrupt, and about half of the patients were hospitalized within twelve hours after the onset of the symptoms. Diarrhea, vomiting and oliguria or anuria were the most frequent symptoms. Thirst, dehydration and muscular cramps were also frequently observed. There were 32 deaths, a mortality of 4.7 per cent, which compares favorably with mortality rates in other reports. Collapse caused death in 17 cases and uremia in 8 cases; other causes of death were hyperpyrexia and pneumonia. Treatment consisted chiefly of the intravenous administration of isotonic solution of sodium chloride and of 0.5 per cent solution of sodium bicarbonate in order to counteract dehydration and collapse. Forty-one patients were treated with sulfadiazine, and the results were compared with those in 41 control cases. The general impression was that treatment with sulfadiazine cut short the duration and reduced the severity of vomiting and diarrhea and thus shortened the course of illness. By so doing, it probably also helped to lower the incidence of uremia. Chemotherapy can in no way replace the use of saline infusion necessary for combating dehydration and collapse during the acute stage.

Sugar Formation and Protein Catabolism Under Influence of Adrenocortical Hormone.—Oberdisse and Werner cite observations by other investigators which suggest that the hormone of the adrenal cortex under certain conditions is capable of facilitating the formation of sugar from protein. This raises the question of the advisability of administering the adrenocortical hormone or one of its synthetics in times when protein intake is limited. The adrenocortical hormone has been used in recent years not only for substitutional purposes, but also in other conditions. The authors decided to investigate whether the administration of adrenocortical hormone would result in an increased elimination of nitrogen in healthy human subjects. Young persons were given a diet consisting of large quantities of carbohydrates and fat and which contained only 1.5 Gm. of protein nitrogen. The caloric excess was 206 per cent of the basal metabolic rate. In the course of eight to eleven days with this diet the nitrogen elimination averaged 3.2 Gm. This corresponded to a catabolic quota of 0.046 Gm. of nitrogen per kilogram of body weight. This elimination of nitrogen did not increase under the influence of desoxycorticosterone acetate. There was no indication that in persons who received plenty of carbohydrates the administration of desoxycorticosterone resulted *in the formation of sugar from proteins* and likewise in an increased breakdown of proteins, as had been observed in starving experimental animals under the influence of cortical hormone. There was always a decrease in the elimination of nitrogen from 3.2 to 2 Gm. on the average; this is believed to be due to reduced urinary output, which is indicated also by increase in body weight.

Radioactive Copper in Studies on Anemic Rats.—Schubert and his associates say that American investigators demonstrated in 1929 that the trace element copper has an activating effect on iron in rats in which anemia has been experimentally produced by feeding with cows' milk. In order to clarify the metabolic chemistry involved the authors decided to investigate this problem with the aid of radioactive copper (C^{64}). It was found that in rats made anemic by being fed exclusively with cows' milk the radioactive copper content of the blood plasma is only about half as high as in controls. This is believed to be due to the increased linkage tenacity of the endogenic copper ions resulting from a reduced catalytic activity of the blood. The liver shows no increase in the copper exchange, but in the bone marrow and the kidney the exchange rate of copper is increased. The radioactive copper content of the blood cells of the anemic animals, in contradistinction to that of the controls, likewise remains uninfluenced.

*Clinical and Endocrinologic Observations in Patients with Metastases from Mammary Carcinoma Treated with Testosterone Propionate. H. Pelser, E. Dingemanse, E. G. Godfried and J. Groen.—p. 3511.

Hereditary Clinodactyly.—Wildervanck presents observations on 2 families in which clinodactyly was hereditary. There was lateral deviation in a radial direction of the little fingers and in some members of the first and other fingers as well. The deviation is the result of slanting of the articular surfaces of the mesophalanges; at the same time the phalanges are shorter than normal (brachyphalangy). In one of the two family groups 65 of 124 members showed the anomaly, and in the second family group 28 of 43 showed it. The anomaly is irregularly dominant and the possibility is considered that more than one gene with identical effect may cause the anomaly. In a third family camptodactylia and clinodactyly were evident.

Metastases of Mammary Carcinoma Following Treatment with Testosterone Propionate.—Pelser and his associates present observations on 6 patients with metastases from mammary carcinoma who were treated with large doses of testosterone propionate. In 4 cases the treatment was combined with surgical or roentgenologic castration. In one case remarkable improvement was observed. The 5 remaining patients died within half a year after treatment. Undesirable secondary effects in 3 cases necessitated discontinuation of treatment with testosterone propionate. In 2 patients the excretion of estrogenic substances increased under the influence of the treatment; in 2 others a decrease was observed. The total excretion of 17-ketosteroids increased as a result of the treatment. Of the testosterone propionate given about 40 per cent was found in the urine.

Interstitial Pregnancy. K. Kulseng-Hansen.—p. 1887.
Prolapse of Female Urethra. G. Ahltorp.—p. 1889.

Menstruation in Thyrotoxicosis.—Riisfeldt found menstrual disturbances in 28.8 per cent of 340 sexually mature women with goiter. Only 3 out of 31 patients with nontoxic goiter had menstrual anomalies. Hypomenorrhea occurred in 44 of 87 patients with thyrotoxicosis, oligomenorrhea in 27 and amenorrhea in 16. Anomalies in menstruation are often an early sign of thyrotoxicosis and were more frequent in women over 30; in 2 cases hypomenorrhea was the first symptom. The increased thyroid activity in hyperthyroidism exerts an inhibitory effect, directly or indirectly, on the gonads. Some patients with irregular menstruation before the onset of thyrotoxicosis became regular during the thyrotoxicosis and continued regular after operative treatment and disappearance of the thyrotoxic symptoms.

Histamine Infusion in Chronic Urticaria. M. Bohman.—p. 1939.
Wassermann Reaction Carried Out by Different Methods. P. Krag and T. M. Vogelsang.—p. 1940.

General Adaptation Syndrome and Diseases of Adaptation.—A description and theoretic interpretation of the general adaptation syndrome are given. It is defined as the sum of all the nonspecific reactions which follow long-continued exposure to stress and is characterized by morphologic and functional changes, the most important being enlargement of the adrenal cortex with increased secretion of corticoid hormones, thymus involution and various changes in metabolism and resistance. It appears in three stages: (1) the alarm reaction, the sum of all nonspecific reactions produced by sudden exposure to stimuli to which the organism is not quantitatively or qualitatively adapted; (2) the resistance stage, the sum of all the nonspecific reactions produced by long-continued exposure to stimuli to which the organism has become adapted, and (3) the stage of exhaustion, the sum of all the nonspecific stimuli to which adaptation has been acquired which can no longer be maintained. Selye states that if the conception of diseases of adaptation proves to be correct the conclusion must be that endocrine disturbances play a large part in internal medicine. Some of the commonest diseases in man seem to be related to failure of the mechanism of adaptation. Recent investigations indicate that diseases such as hypertension, nephrosclerosis and "rheumatic disorders" may appear as by-products of the endocrine reaction in the general adaptation syndrome. Diseases of hypertension, periarteritis nodosa, nephritis, the Waterhouse-Friderichsen syndrome, eclampsia, appendicitis, acute tonsillitis, Cushing's syndrome, secondary shock, gastrointestinal ulcerations, Addison's and Simmond's diseases and primary renal disorders are among the disorders assumed to be disease of adaptation.

*Acute Poisoning and Cardiac Disturbances Caused by Scorpion's Bite. J. Celoria and M. Sloer.—p. 3.

Acute Poisoning and Cardiac Disorders from Scorpion's Bite.—Bothriurus vittatus is the common type of scorpion in the littoral zones of Argentina. The bite of this type of scorpion causes subacute or acute symptoms in adults, and acute symptoms and often a fatal outcome in children. Adults exhibit severe headache, dizziness, nausea, numbness of the extremities and of the tongue. The symptoms subside as a rule in the course of the same day without any treatment. The author reports a girl 6 years of age bitten by a scorpion. She was brought to the hospital four hours later complaining of dizziness, numbness of the tongue and of the extremities, nausea, vomiting and headache. She had moderate dyspnea and cyanosis. Electrocardiographs demonstrated tachycardia, a nodal rhythm and bigeminal and trigeminal extrasystoles. The patient became unconscious with general convulsions, trismus, leftward deviation of the eyes, rhythmic spasms of the arms and frequent vomiting. The treatment consisted of administration of antiophidic serum, nikethamide, oxygen, dextrose solution and an enema containing 1 Gm. of chloral hydrate. The patient recovered. The author directs attention to this type of scorpion venom as a brain and myocardium excitant.

Semaine des Hôpitaux de Paris

Neuropsychopathic Abdominal Perivisceritis. R. Benon.—p. 2905.

BCG Vaccination of Nurses.—Génévrier and Maclouf studied 77 student nurses at the Saint Joseph Hospital in Paris during the period 1934 to 1942. Thirty-one of them continued to have negative reactions and left the nurses school before the appearance of the cutaneous allergy. The reactions of the remaining 46 turned positive; in 13 (17 per cent) this turning was associated with an incident of tuberculous type. Two (2.6 per cent) student nurses had tuberculosis, 1 of them Pott's disease and 1 tuberculous osteoarthritis. Eight (10.4 per cent) student nurses presented benign manifestations. There was an intermediary group of 3 (3.8 per cent) with serofibrinous pleurisy. In contrast to that the tuberculous morbidity was zero in 55 student nurses who were vaccinated with BCG by cutaneous scarification during the period 1943 to 1947. Thus the BCG vaccination prevented all simultaneous or secondary incidents of the turning and made it possible for the nurses who had no reaction to serve prolonged terms in the tuberculous wards. Comparison of these two groups of anergic student nurses at the same hospital proves the efficacy of the BCG vaccination. The subcutaneous injection of BCG may, however, awake a latent lesion in a definitely allergic person. Any allergic person should therefore be strictly excluded from vaccination. The systematic vaccination of the entire anergic population of France is not feasible, but in the well known centers of the disease in certain counties and towns all persons should be vaccinated after birth whether or not they are the offspring of a family of tuberculous persons.

Book Notices

Polio and Its Problems. By Roland H. Berg. With a foreword by Basil O'Connor, President, the National Foundation for Infantile Paralysis, Inc. Cloth. Price, $3. Pp. 174, with 24 illustrations. J. B. Lippincott Co., 227-231 S. 6th St., Philadelphia 5, 1948.

The author, a professional writer not of the medical profession, has undertaken to write a biography of the disease. In this task he has succeeded with a measure of scientific and historical accuracy which reflects due attention to source material. The opening chapter describes the epidemic of 1916 from the point of view of the bewildered layman in those troubled times. If contemporary newspaper accounts, which are freely quoted, offer a true picture of the public's concept of poliomyelitis a generation ago, then indeed we have come a long way on the road to understanding, and it is highly appropriate that the landmarks be listed and the direction of future progress mapped.

Succeeding chapters deal with early investigators, from Heine, Medin and Wickman up to Landsteiner, Kling and Flexner; with the experimental transmission of poliomyelitis to laboratory animals; with successive attempts to check the disease by nasal spray or prophylactic inoculation of attenuated virus material. The author goes on to describe the search for an effective chemotherapeutic agent and the methods used by epidemiologists in their efforts to explain the mode of transmission. Some of the newer tools of research are mentioned, as well as recent progress in the treatment of bulbar poliomyelitis and in applications of physical therapy. A number of the more controversial hypotheses still under active investigation are sketched in broad lines. The contribution of Sister Kenny is judiciously and fairly evaluated. One chapter is devoted to the case history of F. D. Roosevelt, another to the story of the National Foundation for Infantile Paralysis, how it arose and what it strives to accomplish. On the whole, a summary of what is known of poliomyelitis is set forth with reasonably balanced emphasis and in language readily understandable to a layman. If at times the author has let his zeal for simplification carry him close to the limit of factual terrain, there is ample justification in the complexity of the true picture.

The book is aimed primarily at nonmedical readers. Indeed, the physician may well blush at seeing himself placed on so lofty a pedestal, repeatedly characterized as a fearless fighter of disease, a detective in white. Recurrent reference to poliomyelitis as "the Crippler" becomes as tiresome as does the overworked metaphor of militancy in the domain of scientific research, the compelling urge of which is actually closer to that of book collecting than to shooting war. Is it really necessary, one cannot help asking, for the public to have its science prose flavored with such overpowering condiments as modern journalese has brought into all too common use? Fortunately, the final chapter on "The Sum of Our Knowledge," the best in the whole volume, is expressed in moderate terms which go far to dispel the pungent after-taste of the main course. On the whole, in spite of a number of typographic mishaps and egregious grammatical errors, the volume can be recommended as a readable and substantially accurate account of the effort, still largely unrealized, to probe the mysteries of a disease which, if not so common as many others in its overt forms, nevertheless remains indisputably a subject of wide public concern.

In a foreword written by Basil O'Connor, president of the National Foundation for Infantile Paralysis, credit is properly assigned to the American public for its generous contributions, made over a period of years, which have not only helped vastly to carry the burden of medical care of poliomyelitis patients but, what is even more perspicacious, have rendered possible an intensive research program in a field of notable difficulty.

Advances in Pediatrics. Volume III. Editorial Board: S. Z. Levine, Allan M. Butler, L. Emmett Holt Jr. and A. Ashley Weech. Cloth. Price, $7.50. Pp. 363, with illustrations. Interscience Publishers, Inc., 215 Fourth Ave., New York 3, 1948.

This volume by eight writers consists of personalized monographs; each one deals with advances in a particular field in which the author has had considerable experience and achieved recognition for outstanding work. The various subjects include: "The Effects of Birth Processes and Obstetric Procedures upon the Newborn Infant," by Clement A. Smith, Boston; "Retrolental Fibroplasia," by T. L. Terry, Boston; "Emotions and Symptoms in Pediatric Practice," by Milton J. E. Senn, New York; "Therapeutic Agents in the Treatment of Epileptiform Seizures," by William G. Lennox, Boston; "Viral Hepatitis," by Joseph Stokes Jr., Philadelphia; "Abnormalities and Variations of Sexual Development During Childhood and Adolescence," by Lawson Wilkins, Baltimore; "Puberty and Adolescence; Psychologic Considerations," by Hilde Bruch, New York, and "The Osteochondroses," by Beckett Howorth of New York. Just as in the first two volumes the third is outstanding in variety and authenticity of subjects covered.

Each subject is presented in a simple, complete and elucidating manner. The subject of adolescence, which is always a problem to every physician, is admirably considered and very timely. In "Viral Hepatitis" the value of diet and hepatic function tests together with other pertinent information is clearly and accurately presented. The reproductions of roentgenograms in the various ostrochondroses are good. Each subject is brought up to date in a thorough and interesting manner.

The printing, paper and construction of the book are excellent. Books such as this should be in the library of every physician who wants to keep abreast with the latest and the best in medicine.

Health Education: A Guide for Teachers and a Text for Teacher Education. Edited by Charles C. Wilson, M.D., Professor of Education and Public Health, Yale University, New Haven, Connecticut. Revision Committee: Thurman B. Rice, M.D., Bernice Moss, Ed.D., W. W. Bauer, M.D. Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association with the cooperation of contributors and consultants. Fourth edition. Cloth. Price, $3. Pp. 413, with illustrations. National Education Association of the United States, 1201 16th St., N.W., Washington 6, D. C., 1948.

This book is representative of medical and educational thinking on the subject of health education. The committee of five members from each profession, appointed by their national organizations, has brought together accurate scientific information and sound pedagogic principles.

The 1948 version of this guidebook on health education is actually a completely rewritten fourth edition of the reports which appeared in 1924, 1930 and 1941. In addition to the planning and work of the Joint Committee, over a hundred contributors and consultants drawn from the professions of education and medicine and from the field of public health participated in the development of the manuscript. Dr. Charles C. Wilson, editor of the book, directed the project with the aid of a revision committee.

The book offers the best present day point of view concerning the philosophy, methods and content of health education. The nation's health needs are defined, especially as they relate to children, and emphasis is placed on community cooperation as a means of solving these problems. Methods of making the health services furnished by physicians and nurses worthwhile educational experiences and of improving the health behavior of children through healthful living at school are discussed at length. Detailed suggestions are made in respect to the organization and administration of health education in the elementary and secondary schools, and for college and adult groups. Ways of using motion pictures, film strips, exhibits, radio and other audio-visual aids to vitalize health teaching are described and methods of locating appropriate and authentic resources discussed. Methods of measuring results obtained and progress made are suggested and a number of reports of learning experiences in health at the various grade levels are outlined.

The editor and the revision committee have succeeded in combining a worth while factual presentation with an interesting style. It is easy and pleasant to read and the photographs are excellent. Tables, charts and other illustrative material further encourage the reader.

While the book will be of greatest value as a guide for teachers in service and a text for teacher education, it should be required reading for school physicians, administrators and nurses. It is highly recommended to any physician who wishes to acquaint himself with modern health education practices, and as a valuable edition to the library of the thousands of physicians who act as personal medical adviser to school children and their families.

Drug Research and Development. Edited by Austin Smith, Secretary, Council on Pharmacy and Chemistry, American Medical Association, Chicago, and Arthur D. Herrick. Cloth. Price, $10. Pp. 596. Revere Publishing Co., 15 Trinity Place, New York 6, 1948.

Each of the authors provides at least one chapter dealing with that phase of the general topic which, through actual experience, he is eminently prepared to present. The thorough scope of the work can best be presented through the chapter headings which follow:

The Modern Drug Formula
Chemistry of the Formula
Pharmacology of the Formula
Laboratory Research
Development of Biologicals
Clinical Testing
Development of Facilities and Controls
Labels and Labeling

As the chapter heads indicate, every possible phase of the subject has been covered, making the book the first of its kind, and one to be considered by the drug manufacturer and distributor, the research and laboratory worker, the physician and pharmacist, the advertising counsel and sales representative, each of whom, as the editors point out, is a participant in the development of drugs and drug therapy. This compilation is an outstanding contribution to the drug industry, well written and comprehensive in its scope.

The book is not just one for a manufacturer's library; it should be in the hands of at least each department head who has any part in the development of new drugs, and preferably available to others in the department, that each may understand how his contribution is integrated with the whole. It cannot help but be valuable even for the well established manufacturer who has already developed many new drugs, and it will, undoubtedly, save many dollars, hours and setbacks for the one who is just embarking on such a program. If this volume had been available several years ago, a number of most unfortunate "accidents" would, undoubtedly, never have occurred, and following its pattern today will certainly prevent many additional "mistakes." In addition, the book should be used by every pharmacy college now giving specialized instruction in manufacturing, for these are the men who will go into industry and take an important part in many phases of drug research and development.

Vers la médecine sociale. Par René Sand, professeur de médecine sociale à l'Université de Bruxelles, Brussels. Paper. Pp. 671. J. B. Baillière et fils, 19 Rue Hautefeuille, Paris, 6ᵉ; Desoer, 21 Rue Sainte-Véronique, Liège, 1948.

Dr. Sand presents in this volume a cyclopedic review of developments which reflect the recognition of social factors in health and disease. Well documented sections deal separately, on a worldwide basis, with the growth of medicine as a profession, the history of hospitals, individual hygiene and social (public) hygiene, industrial medicine, public welfare and various branches of the social sciences in relation to medicine and health. A final section discusses the coming of social medicine and presents an integration and evaluation of the full range of scientific and cultural developments which are making this concept the basis of medical practice for the future. Dr. Sand sees the true scope of social medicine as encompassing the concept of health for all, including preventive, therapeutic and reparative care, and using the combined resources of physicians, sanitarians and other professional groups in medicine, biostatisticians, psychologists, welfare workers and sociologists.

The author accepts the democratic concept of the individual, to be considered in a social context. Rather summary reference is made to developments in compulsory health insurance. The author, however, grapples with the problems of economics in medical practice on philosophic and medical grounds and concludes that group practice and compulsory insurance with capitation payments are the functional solutions.

The volume includes a five page table of contents, a six page general bibliography, a twenty-nine page index of names and a well organized twenty-five page subject index, as well as numerous footnote references to pertinent facts in the text.

Handbook of Orthopaedic Surgery. By Afred Rives Shands, Jr., B.A., M.D., Medical Director of the Alfred I. duPont Institute of the Nemours Foundation, Wilmington, Del. In collaboration with Richard Beverly Raney, B.A., M.D., Associate in Orthopaedic Surgery, Duke University School of Medicine, Durham, N. C. Third editon. Cloth. Price, $6. Pp. 574, with 159 illustrations by Jack Bonacker Wilson. C. V. Mosby Company, 3207 Washington Blvd., St. Louis 3, 1948.

The author in the preface to the first edition made the following statement, "The fundamental facts and principles of orthopedic surgery are presented as concisely as possible and in sufficient detail to convey a well rounded knowledge of the subject."

This is definitely true for the third edition which contains twenty-four chapters and a most excellent bibliography.

The line drawings and roentgen photographs are adequate and descriptive.

This edition did not contain a description of cohesive-adhesive bandaging for clubfoot. It failed to mention the Frejkas pillow splint for treatment of congenital hip dislocation in infants. It did not indicate the diagnostic lines on the roentgenogram for determining these congenital hip dislocations. Polyostotic fibrous dysplasia was not discussed, and it should have been described under "Affections of Adult Bone." More emphasis would have been valuable on the physical therapeutic technic of muscle training and stretching in "Anterior Poliomyelitis."

This is still the best American handbook of the specialty available for students and general practitioners. It is well written, well presented and highly recommended.

Plaster of Paris Technic. By Edwin O. Geckeler, M.D., Professor of Orthopaedic Surgery, and Chief of the Fracture Service, Hahnemann Medical College and Hospital, Philadelphia. Second edition. Cloth. Price, $3. Pp. 220, with 236 illustrations. Williams & Wilkins Co., Mt. Royal & Guilford Aves, Baltimore 2, 1948.

In preparing this edition the author has incorporated suggestions offered by orthopedic and traumatic surgeons. Many illustrations have been added which enhance the value of this book.

The author is a devotee of plaster of paris. He believes in individualization of the patient.

A large proportion of orthopedic conditions must be immobilized with plaster. The inadequacy of wood or metal splints for injuries except emergencies is mentioned. Plaster technic is by no means standardized, and application of a splint or cast should be adapted to the individual; thus there is opportunity for originality and improvement in technic.

Curriculums for medical students provide little instruction in this plaster of paris technic. The beginner often must learn through his own resources. In many instances the surgeon himself does not apply the plaster to his patients, but assigns this part of the treatment to the intern. There appears to be a popular idea that the application of plaster means just so much labor, and that it requires time which could be spent otherwise to greater advantage.

Orthopedic technic and the reduction of fractures have been intentionally omitted from this book. To learn plaster technic the reader not only is advised to follow the instructions carefully, but also should practice extensively on actual patients.

The material covered includes general technic in the application of plaster of paris. Errors and difficulties are enumerated. The author discusses and illustrates the technic as applied to various parts of the body, such as the spine, shoulder, upper limb, pelvis and lower limb. He also discusses the use of plaster of paris in war surgery, compound fractures, osteomyelitis, injury and inflammation of soft tissues and in the care of burns.

Diabetic Manual for the Doctor and Patient. By Elliott P. Joslin, M.D., Sc.D., Medical Director, George F. Baker Clinic at New England Deaconess Hospital, Boston. Eighth edition. Cloth. Price, $2.50. Pp. 260, with 51 illustrations. Lea & Febiger, 600 S. Washington Square, Philadelphia 6, 1948.

This manual, now in its eighth edition is no doubt the leader in its field, representing as it does the writings, the views and the experiences of one of America's greatest investigators and practitioners in this field. The presentation is simple and accurate and possesses the necessary journalistic qualities to make it intensely readable. Among a dozen or more books available in the field, this one may be recommended without reservation.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT *BE NOTICED.* EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

AIR POLLUTION IN DONORA

To the Editor:—*Life* magazine, Nov. 15, 1948, states "Death Over Donora . . . Doctors went into action, one of them rushing down a street giving adrenalin injections to choking citizens who came out of their homes through the smog, pleading to be next. Within 48 hours, 19 people were dead, more than 400 sick." What is the most helpful treatment for persons acutely ill because of air pollution? Here in Los Angeles our main problem used to be water, but, as you may have heard, recently we have had some trouble with air.

Clarence W. Olsen, M.D., Beverly Hills, Calif.

ANSWER.—Much speculation has entered the appraisals of happenings at Donora. At the time of the preparation of this reply, no official report is known to have been made. On this account some conjecture may influence this reply. It appears likely that the Donora disaster foremostly resulted from the coexistence of a number of meteorologic conditions that might have been anticipated as of possible occurrence and in the possible absence of any unusual happenings at the metal plant, widely condemned. The simultaneous occurrence of a dense fog, limited air movement, the absence of upward movement of atmospheres, peculiar air temperature situations, together with the presence, in these low-hanging, little moving clouds, of the usual output of factory gases, possibly may fully account for the ensuing events. To a lesser degree, these fortuitous meteorologic situations take place every year in many industrial cities and particularly where the terrain is characterized by high hills. It may be assumed that mass hysteria pervaded the population and that the total number of genuine cases is somewhat lower than reported. It may be assumed that both sulfur dioxide and trioxide were present. These irritant gases in the absence of water droplets ordinarily do not penetrate deep into the respiratory tract. When water droplets are present and the mentioned irritant gases enter the droplets, they then may be expected more readily to enter the lungs and to induce deeper seated injury. To some extent, pulmonary edema may arise. Further, with or without pulmonary edema, some bronchial spasm may occur. The resulting symptom complex may be similar. For persons with asthma on an allergic basis, it does not necessarily follow that the mentioned irritants would induce asthmatic attacks. On the other hand, it may not be necessary to assume preexisting allergic asthma as essential to spasmodic muscular contractions. In any event, the prevailing state of panic heightened the evil occurrences. In the case of aged persons with presumed imperfect cardiovascular systems, pulmonary edema in particular may be regarded as likely to have imposed increased cardiac burdens. If perfect therapeutic facilities might have existed, the use of oxygen under pressure, associated with complete rest, probably would have afforded the best treatment. Ephedrine and epinephrine administered either subcutaneously or through inhalation undoubtedly were of value both psychologically and factually notably for those in whom muscular spasms along the respiratory tract occurred. Other bronchodilators, such as aminophylline, would have proved serviceable, especially in the early involvement stages. Since aminophylline is best introduced intravenously its use is obviously circumscribed in mass emergencies. If any such catastrophe might have been anticipated, possibly the best single drug for self administration would be epinephrine administered by hand atomizers. Definitely it is not intimated that any such self medication would be universally efficacious. This query specifically seeks "the most helpful treatment for persons acutely ill because of air pollution." Manifestly, any proper answer starts with "air pollution by what?" Until reply may be provided, the best single step is the provision of oxygen and the avoidance of exertion.

VISUAL ILLUMINATION

To the Editor:—Please give information on the optimum illumination for maximum visual efficiency. Morton Arnold, M.D., Willimantic, Conn.

ANSWER.—Optimum illumination for maximum visual efficiency is actually difficult to determine. In general it depends on a number of variables, including: 1. The illumination itself: the source varies, such as sunlight, electricity, gas light (now neon, etc.), kerosene and fireside light, and is measured and rated in "foot-candle." 2. The object viewed: this depends on (*a*) form: the letters T, L and O are easy to read in comparison with Z, G and N; form is determined better by black or white than it is by any color contrast; (*b*) color: red is seen farther than green; yellow "contrasts" better with blue than it does with red; "continental" red gives a marvelous stereoscopic effect when crossed by narrow black lines; etc.; (*c*) dimension: three-dimensional objects develop greater visual efficiency than do two dimensional "flat" objects. 3. The eye itself as the receiving apparatus. You cannot get a good picture with a poor, insensitive film and you cannot get perfect visibility with an imperfect retina. The media of the eye must transmit light correctly: it must be clear and it must be uniform, not varying in density here and there, as in the cornea, lens and vitreous humor; fine closely placed opacities interfere most, and disseminated diffuse minute opacities make more trouble than do larger ones, e. g., a millimeter-sized posterior polar cataract. 4. The psychology of vision, about which we know so little, may well be a factor influencing efficiency, especially when illumination varies.

On the practical side, probably nineteen twentieths of our distress comes from what happens when we look at objects within 2 feet (61 cm.) of our eyes rather than what happens when we look at objects at a greater distance (as 3 feet [91.4 cm.] or 20 feet [6.1 meters] or 100 feet [30.5 meters]). Near vision makes much greater demands. One who has two-thirds vision for distance objects seldom wishes or needs glasses, although they improve vision by three or four lines. For groups working in library, office and schoolroom, the writer holds that uniform, but rather weak, light, which just enables one to miss waste baskets, spittoons, etc., is enough, along with a good, goose neck, $3 desk light and 100 to 150 watt bulbs.

Indirect, reflected lighting requires too much current, generates too much heat and is unnecessary. In general, it seems to be on the way out. For room and space lighting the type secured by multiple reflectors about each small unit may meet great acceptance in the immediate future

GENETIC ASPECTS OF SCHIZOPHRENIA

To the Editor:—Is dementia precox inherited? A patient has a half-sister in whom dementia precox, catatonic type, developed at age 16. They had the same father and their mothers were twin sisters, but it is not known whether they were identical or fraternal twins. The patient is anxious to have children, but is hesitant. Assuming that the husband's family history is negative and that the half-sister's case is the only one in the wife's family, is it advisable for this couple to have children? What are the chances of the offspring's developing insanity or other nervous system disease as compared to parents with "normal" backgrounds? Does it make any difference if the mothers were fraternal or identical twins?

M.D., Washington, D. C.

ANSWER.—The genetic aspects of schizophrenia (dementia praecox) are controversial. What evidence has been advanced may be summarized by the following:

There is no inheritance of fully developed characters or anomalies but only a transmission of predispositions, i. e., specific potential responses to the environment (Gates, R. R.: Human Genetics, New York, the Macmillan Company., 1946). Statistical data have been presented which indicate that schizophrenia (dementia praecox) occurs more frequently in families which include a known case of schizophrenia than it does in the general population (Kallman, F. J.: The Genetic Theory of Schizophrenia, *Am. J. Psychiat.* **103**:3, 1946). The average expectancy of schizophrenia in the general population is 0.85 per cent. Children of one schizophrenic parent have a 16.4 per cent probability of getting the disease; the grandchildren 4.3 per cent and the nieces and nephews 3.9 per cent. The schizophrenic rate of parents of schizophrenic persons approximates 10 per cent. The expectancy for brothers and sisters as well as for the fraternal twin partners of schizophrenic persons is around 14 per cent; for half-siblings it is 7.6 per cent and for step-siblings 1.8 per cent. The identical twin partners of schizophrenic persons show an expectancy rate of 85.8 per cent (Kallman, F. J.: Modern Concepts of Genetics in Relation to Mental Health and Abnormal Personality Development. *Psychiatric Quart.* **21**:535-553 [Oct.] 1947).

The clinical expression of the disease in these "carriers" requires, in addition, the provocative influence of all those life situations generally recognized to be psychopathologically conducive to the development of schizophrenia. Evidence that the genetic predisposition to schizophrenia bears any relation to other psychoses or "nervous system disease" is lacking.

Eugenic advice in instances such as this should be given not only in the light of these genetic findings but also with complete assessment of, and full consideration for, the many other personal factors which uniquely characterize the inquirer.

CHRONIC BRUCELLOSIS

To the Editor:—A 34 year old white female patient, para I, is now two and one-half to three months pregnant. Beginning about fourteen years ago fever developed of unknown origin. Four years ago a diagnosis of undulant fever was made, at which time her doctor treated her with undulant fever vaccine. She was told after this treatment that she was cured. However, she has had recurrent fever up until six months ago. Since that time she states that she has not had recurrence of the fever. Does vaccine cure the disease? What is the accepted method of treatment in this case? Is aureomycin indicated? Matthew A. Mroz, M.D., Deland, Fla.

Answer.—With respect to expectations from therapy, to latency of infection and the likelihood of relapses or recovery, brucellosis is much like tuberculosis. Fewer false hopes of "cures" would be aroused if those who treat patients with brucellosis would adopt the point of view now widely held concerning therapy in tuberculosis. Various agents or regimens may induce remissions of variable lengths in many patients. Single agents or modes of therapy for chronic brucellosis that are successful with all patients are not known. Aureomycin is effective in inducing impressive remissions in acute brucellosis; whether or not these remissions will persist for three or five years, with or without transitory or prolonged relapses, is not yet known. It is unlikely that a fair appraisal of its value in chronic brucellosis can be made in less than five years. Although the currently observed toxic reactions from aureomycin are inconsiderable one cannot foretell from the present small experience what the future may bring after the antibiotic is widely used. If study of the patient should disclose active chronic brucellosis, some form of treatment is advisable. An informative paper with important bearings for this patient is "Undulant Fever in Children," by Hagebusch and Frei *(Am. J. Clin. Path.,* **11**:497-515 (June) 1941).

TREATMENT OF BRUCELLOSIS

To the Editor:—A woman aged 56 has had 4 children, an appendectomy and a hysterectomy. She now complains of considerable abdominal distress and pain in the right upper quadrant, arthritis in various joints, particularly in the hands, numbness, insomnia, headache, and chills and sweats with dryness of the skin. Her blood pressure and urine are within normal range. A roentgenogram of the gallbladder is negative. This patient was given an intradermal test for undulant fever which elicited a positive reaction. Result of an agglutination test of the blood was negative. Should this patient be treated for undulant fever? What is the standard treatment for undulant fever? J. L. Snavely, M.D., Sterling, Illinois.

Answer.—In the foregoing statement reference is not made to whether the patient has had fever. The clinical findings are only suggestive of brucellosis and the diagnosis in this case is not established on the basis of a positive reaction to an intradermal test. Since conclusive evidence for active brucellosis is lacking, the patient should not be given specific antibrucella therapy.

It has now been established by several investigators that a combination of streptomycin and sulfadiazine is an effective form of therapy in proved brucellosis. The dose of streptomycin is 0.5 Gm. intramuscularly every eight hours for two weeks. At the same time that streptomycin is started, 3 to 4 Gm. of sulfadiazine is administered orally, and then 1 Gm. every four hours for the same period. Therapy with both drugs is then discontinued. Because streptomycin may induce toxic reactions, especially vestibular dysfunction, dihydrostreptomycin is preferred. Dihydrostreptomycin is just as active against Brucella as is streptomycin. Recent clinical studies reveal that aureomycin is effective in acute brucellosis. The antibiotic has been administered orally in doses of 0.5 Gm. every six hours for ten days to two weeks. Definite dosage schedules remain to be worked out.

PAPAVERINE IN CORONARY DISEASE

To the Editor:—Papaverine has been advocated by some cardiologists in the treatment of acute myocardial infarction with the idea of producing vasodilatation of the coronary arteries and promoting the development of collateral circulation within the coronary artery system. Can nitrates be used for this purpose in myocardial infarction?

Ernest B. Williams, M.D., Salt Lake City.

Answer.—Papaverine acts directly on smooth muscle, causing relaxation, and has been used predominantly for the treatment of spasm of the bile ducts and of the gastrointestinal tract, occasionally also in bronchial asthma and in recent years in coronary heart disease. Conclusive evidence is lacking that it acts by sedative effect on the central nervous system. Unfortunately, it is not infrequently disappointing in the treatment both of acute myocardial infarction and of recurrent angina pectoris. Its effect is more prolonged than that of glyceryl trinitrate but erythrol tetranitrate has in many cases a more favorable effect, which last for several hours.

FAMILIAL PERIODIC PAIN

To the Editor:—A family gives the history of periodic pain in the extremities traced back through five successive generations on the mother's side. Thirteen were females and three males. The trouble starts in early childhood—in infancy in 1 known case—and continues throughout life. Discomfort in one or all extremities occurs in series of eight to twenty spells lasting a few minutes to one hour over a period of one to two days. These sessions may be a few days or a few weeks apart, becoming less frequent as the patient grows older. Exciting cause is unknown. They occur at rest or during activity, day or night, and during all seasons. Pains consist of an aching discomfort, greatest about the knees or elbows but involving the muscles, toes and fingers. The patient can usually go about his duties but at times, especially if one of the younger children, he cries with the pain. Acetylsalicylic acid and massage give the greatest relief; quinine, sedatives, antihistaminics, iodides, methacholine, calcium and glyceryl trinitrate did not help. All routine laboratory work has been normal. Roentgenograms of the extremities in 1 patient were normal. Her electroencephalogram showed mild cerebral dysrhythmia. Suggestions will be appreciated. F. R. Janney, M.D., Wauwatosa, Wis.

Answer.—Known neuropsychiatric entities do not correspond to the condition described. Myalgia and muscular rheumatism are not considered either hereditary or familial. The painful extremities seem to have been a familial affair.

ULCUS VULVAE ACUTUM

To the Editor:—A 20 year old patient has suffered for four years from recurrent attacks of erosive lesions appearing simultaneously on the mucosa of the mouth, lips, vagina and external genitalia often accompanied by fever and joint aches. At two large medical centers she was told that the condition was a type of erythema multiforme. She has had a complete allergic work-up without strikingly positive results. She has avoided all cosmetics and powders and except for treatment given during attacks has not taken drugs. She has had a trial on nonallergic diets, sulfadiazine, penicillin, multiple vaccination with smallpox vaccine and antihistamine drugs, all to no avail. Secondary invaders were cleared by the antibacterials. Her present attack has lasted two months without signs of regression. She has been treated with sulfadiazine, salicylates and alkali, and a course of diethylstilbestrol therapy. Please suggest further treatment. Will neoarsphenamine be of benefit?

M.D., Maryland.

Answer.—The description and clinical course of this case suggest in addition to erythema multiforme the disease "ulcus vulvae acutum," which is thought to be due to Bacillus crassus, a saprophyte of the genital tract. Sometimes the lesions respond to treatment with hygienic measures, but the disease is prone to recur. A thorough search should be made for a focus of infection which could conceivably furnish the source for an erythema multiforme reaction. And, since all orthodox methods of treatment have failed to give relief in this case, it might be well to try therapy with a preparation of arsenoxide intravenously, 0.04 Gm. every five days, although arsenicals have been used in other cases without much success. The administration of vitamin B and liver extract and—more important—psychotherapy are measures that give most promise of success in cases of ulcus vulvae acutum.

CHEMICALLY PRODUCED SOFT WATER

To the Editor:—Is there a hazard involved in drinking chemically produced soft water? Are there any advantages in drinking hard water? If one drinks soft water, is it necessary to add chemical or salt in tablet or liquid form to prevent harmful effects on the body chemistry?

S. Albert Molle, M.D., Los Angeles.

Answer.—The body's need for minerals is largely met through foods, not through drinking water. A fair portion of the earth's population regularly depends on rain water for drinking purposes. In other areas, such as portions of Michigan, potable waters are rich in sodium chloride. In other communities the drinking water supply is chemically softened. In none of these situations is it well established that the health of consumers is modified. It may not be inferred that all mineral constituency of water is without health significance. In a few localities, nitrites in ground waters may lead to methemoglobinemia, notably in infants. Some water supplies contain a helpful content of iodine which should not be removed by any water treatment. Some drinking water sources provide a suitable level of fluorine which aids in the prevention of decayed teeth. Slightly higher amounts of fluorides may prove detrimental and lead to impairment such as "mottled enamel." To meet the need for fluorine intake, some communities commendably are adding judicious quantities of fluorine salts to water supplies as a step in dental hygiene. Newcomers to many communities readily are upset by quick change to new types of drinking water, and such affections as diarrhea are common, particularly if magnesium compounds are present. An old belief is that hard waters favor the occurrence of lithiasis, but little support for this idea may be established. While denying any great significance for minerals in waters in human economy, it is recognized that at least some minerals, such as calcium, are metabolized with benefit. In general, the advent of any proper water-softening procedure may not be expected to call for special readjustment so far as health is concerned.

COLD HYPERERGY

To the Editor:—A 16 year old patient breaks out with typical "hives" all over her body after exposure to cold or after strenuous muscular exertion. This is accompanied by severe itching, but not other symptoms. Composition of her clothing does not affect this. She gets relief from antihistaminic therapy. Would you advise skin testing for allergic sensitiveness? What would most likely cause this condition?

Philip L. Blumenthal, M.D., Mandan, N. D.

Answer.—The syndrome described is a thermal hypersensitivity. In some cases the stimulus is cold; in others heat, and in still others both heat and cold will produce the response. The best evidence available indicates that this is not an allergic reaction (antigen reacting with antibody) but that it is most likely due to a mechanism whereby histamine is readily released from the cells by the stimulation from moderate degrees of cold and heat. Intense cold and heat stimulation will normally release excess histamine. In the abnormal cases, such as the one described, the same result is produced by a lesser stimulus. This should be regarded not as allergy but rather as hyperergy (exaggerated normal response).

Of course, in such a primary response, tests with foods, clothing or other allergens would be useless. One must keep in mind, however, that there are cases of true food, inhalant and other allergy where cold or heat act as secondary factors, precipitating the allergic reaction.

Antihistaminic drugs are usually effective for these conditions. They are most efficient when used prophylactically, a dose of the medication being taken about one hour preceding the anticipated exposure to heat or cold. A change of climate frequently relieves the syndrome. A tolerance can be frequently produced by varying schemes of daily exposure to cold water followed by warm, or to baths the temperature of which is gradually diminished from day to day. A more complete discussion of the subject may be found in the chapter on allergy to physical agents in Feinberg's "Allergy in Practice," Chicago, Year Book Publishers, 1946.

HEMOLYSIS DUE TO ISOHEMAGGLUTININS

To the Editor:—In routine cross matching prior to a blood transfusion, I have noted that frequently we obtain some hemolysis of the recipient's erythrocytes when the donor serum is added. This occurs chiefly when a Landsteiner group O donor blood is matched with a recipient of another blood group. In these cases, I assume that there is an alpha and/or beta hemolysin present. What do you consider to be the maximum titer of a hemolysin in the donor's serum that can be safely present in a 500 cc. transfusion to a recipient with erythrocytes susceptible to that hemolysin? I have learned that some responsible blood banks inactivate the donor serum at 56 C. for ten minutes in order to eliminate this hemolytic action and thus allow the agglutination reaction, if present, to be manifest. Is this a dangerous procedure? Would it not hide a potential hemolytic reaction in the recipient? What do you consider to be the best cross matching technic for routine purposes that would reveal the agglutinating and hemolyzing properties of the donor serum on the recipient's erythrocytes?

M.D., New York.

Answer.—If hemolysis is due to A or B isohemagglutinins, it is usually preceded or accompanied by agglutination. Therefore inactivation of donor serum would probably not hide potential hemolysis from this source. However, in using group O blood for group A, AB or B recipients it is advisable either to add group-specific substances A and B to diminish the isoagglutinin content or to select blood which is already of low isoagglutinin titer; that is, less than 1:200 when tests are carried out in saline solution by the tube-centrifugation method. Recently attention was called to the fact that the isoagglutinin titer of some group O bloods is much higher when AB plasma or serum is used as a diluent than when saline solution is used. It has been suggested that these persons may be dangerous universal donors. Therefore, it may prove advisable to measure isoagglutinin titers in these diluents rather than in saline solution. The best cross matching technic for routine purposes is probably the tube method. However, it is good practice to cross match the blood of persons who have received multiple transfusions or who are suspected of Rh sensitization. The open slide method or the tube method with plasma or saline solution as a diluent to guard against reactions due to the presence of the so-called "blocking" or "hyperimmune" antibodies in the recipient's serum may be used.

PATCH TESTING ON MUCOUS MEMBRANE

To the Editor:—Please describe the technic of patch testing on mucous membranes.

Walter Weinberger, M.D., Juniata, Altoona, Pa.

Answer.—Patch testing on mucous membranes is considered when stomatitis is suspected from direct contact with an allergenic substance with the mouth, as with penicillin, tooth paste and similar possible allergens. The technics of such are described fully by Farrington (Modifications of the Goldman Technique for Contact Testing of the Buccal Mucosa, *J. Investig. Dermat.* 8:59, 1947) and Goldman and Goldman (Contact Testing of the Buccal Mucous Membranes for Stomatitis Venenata *Arch. Dermat. & Syph.* 50:79, 1944). Briefly, this consists of fastening the allergen with collodion to a small rubber suction cup which is held in place on the surface of the teeth A modification of this is to fasten the allergen to a rolled up rubber finger cot and to anchor the latter with silk floss around a tooth with the help of a button on the buccal surface of the teeth. The allergen is usually held in place about twenty to thirty minutes. The mucosa on the contacting surface is examined for reactions several hours to a day or two later.

TUBEROUS SCLEROSIS

To the Editor:—A girl, aged 25, has one brother, aged 28, who is epileptic and mentally defective due to tuberous sclerosis—diagnosed by biopsy of a skin lesion on the chest. He was born with the "brown spots" but had no major epilepsy till age 17 and no minor attacks till after that. His father had epileptic attacks at age 17 and had "sick headaches with vomiting" to middle age. The father had 1 brother who had the "brown spots" and one arm shorter than the other. The father has 5 sisters, none of whom had symptoms of tuberous sclerosis so far as is known. The mother's father was "nervous" and died at age 42 of diphtheria; the mother's mother reached the age of 89, the father's mother 70 plus, and the father's father 92.

The girl contemplates marriage and children. With the brother's diagnosis just recently made, she has been told, dogmatically but perhaps correctly, that she must never have children. The girl has shown no sign of tuberous sclerosis or any other physical defect. Her intelligence is at a high level.

Is tuberous sclerosis hereditary? If so is it dominant, recessive or sex linked? What percentage of cases are sporadic? Is there sufficient evidence to condemn this patient to childlessness?

M.D., Canada.

Answer.—Authorities consider that tuberous sclerosis is a form of Recklinghausen's disease (neurofibromatosis or congenital ectodermatosis). Associated features of tuberous sclerosis (epiloia) are sebaceous adenoma, brown patches (café au lait), and nevi of the skin, and nodules in kidney, heart (rhabdomyomasa), retina or brain. Pathology of the brain results in epilepsy and mental deterioration. (Yakovlev, P. I., and Guthrie, R. H.; *Arch. Neurol. & Psychiat.* 26:1145 [Dec.] 1931).

Epiloia is believed to be transmitted as a dominant, not sex linked. As with other serious diseases in which patients die young or fail to have children, the number who owe their disease to mutation and not to inheritance from a parent is relatively large—"from a quarter to a half of all cases encountered." "Transmission through two generations is not infrequent, but transmission through three is distinctly rare." "One person in 60,000 to 120,000 suffers from epiloia as a result of mutation in a parent." (Roberts, J. A. F.: An Introduction to Medical Genetics, London, Oxford University Press, 1940.) The almost complete absence of symptoms of epiloia in relatives of the brother suggests that his epiloia has arisen from mutation. His seizures might be inherited from the father, who had a history of convulsions and migraine. For possible light on this point, the sister might wish to have an electroencephalogram of herself. As the evidence is not clear that the brother's epiloia was transmitted as a dominant through preceding generations and because the young woman possesses genetic traits that are desirable, advice that she remain childless seems hardly justified.

METASTATIC CANCER OF VERTEBRA

To the Editor:—About one year ago a patient had a resection of the descending colon for carcinoma. Recently, she has suffered pains in her back and in one leg. Roentgenograms seem to indicate a recurrence in the fourth and fifth lumbar vertebrae. What is the best treatment of this condition either by roentgen rays or by estrogenic substance?

M.D., New York.

Answer.—The pain from skeletal metastasis usually responds well to irradiation therapy. It would seem to be the treatment of choice in the described case. In the light of our present knowledge, estrogenic substances would not be indicated. The usual pain-relieving drugs should be employed as necessary.

ACUTE ARTERIAL INJURIES

NORMAN E. FREEMAN, M.D.
San Francisco

Acute injuries of the major arteries are encountered not infrequently in civilian practice. They present a problem, both from the standpoint of immediate mortality and in regard to the ultimate functional results. Arrest of hemorrhage and the preservation of an adequate arterial supply to the extremity are the objectives of treatment. "The final result and the ultimate prognosis," as Elkin[1] has written, "will depend in the main upon the original treatment received shortly after the injury."

INCIDENCE

The incidence of battle injuries of the arteries in World War II was computed by DeBakey and Simeone[2] to be approximately 1 per cent of all casualties. Although the proportion of civilian injuries due to penetrating wounds is smaller than in war casualties, the great annual number of civilian accidents necessarily entails the sustaining of some type of vascular injury by a large number of persons. The National Safety Council recently reported approximately 10,000,000 civilian accidents occurring annually, and a majority of these injuries involved the extremities. It has been estimated that almost 8 per cent of our population is injured annually by various types of accidents. An understanding of the mechanisms of arterial injury and the principles of adequate early treatment is therefore necessary for physicians who may be called on to handle such emergencies.

ETIOLOGIC FACTORS

The majority of arterial injuries are produced by lacerations or penetrating wounds. It must be emphasized, however, that an injury to a major artery is not necessarily indicated by an open wound. Fractures of the long bones may be associated with lacerations of the vessels from sharp fragments, or there may be compression of the artery from angulation, especially in cases of dislocation. Crushing injuries, even without fracture or dislocation, may disrupt the continuity of the blood vessels or produce such arterial spasm that the circulation to the distal parts is seriously impaired.

TYPES OF INJURY

Arterial injuries may be considered under the following categories: (1) complete division; (2) partial division; (3) contusion, with or without thrombosis, and (4) compression.

Complete division of a major artery, even associated with a large wound, does not necessarily lead to exsanguinating hemorrhage. Retraction of the ends of the injured vessel with the attendant arterial spasm may permit formation of a thrombus which effectively seals the lumen. Low blood pressure from shock favors the development of such thrombosis.

If the vessel is not completely divided, retraction of the two ends is impossible and the likelihood of spontaneous arrest of hemorrhage through thrombosis is diminished. Even though the bleeding is temporarily arrested, secondary hemorrhage is likely to occur. If the external wound is small, further bleeding will be prevented by the resistance of the tissues. The hematoma thus formed will be in direct contact with the pulsatile arterial stream. In this manner a pulsating hematoma is formed. Organization of the hematoma leads to the formation of a false aneurysm. If the accompanying vein is injured simultaneously, an opportunity is provided for the arterial blood to escape into the venous side of the circulation. In such circumstances the pressure within the hematoma is less and healing is more likely to occur. However, an arteriovenous fistula results.

Contusion of a major artery may or may not result in thrombosis. In the Department of Experimental Surgery, University of California, laboratory experiments have confirmed the observations of Smith[3] that trauma to the arterial wall, even with extensive destruction of the intima, does not produce thrombosis as long as the volume flow of blood through the vessel is maintained. Similarly, obstruction to the flow does not produce intravascular thrombosis as long as the intimal lining is intact. Only if there is a combination of intimal damage and restriction of blood flow is thrombosis likely to occur.

Arterial spasm frequently follows contusion. Even though the vessel has not been touched, the artery may go into spasm, involving not only the main vessel but the collateral vessels as well. The exact mechanism is not understood. It is apparently dependent on the intrinsic properties of smooth muscle, since the spasm is not relieved by periarterial injection of procaine hydrochloride, by stripping of the nerve plexus from the artery or even by injection of the sympathetic ganglions supplying the part.

From the Division of Surgery, University of California Medical School.

Read before the Section on Surgery, General and Abdominal, at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

Compression of an artery by a displaced bone fragment in the case of a fracture or dislocation is a serious lesion, since complete obstruction to the blood flow, together with even a slight amount of trauma to the arterial wall, will lead to thrombosis. Arterial compression is encountered particularly with injuries about the elbow and the knee where the vessels are relatively fixed and lie close to the bones.

SITE OF INJURY

It is well known that injuries of arteries in certain locations may have little effect on the survival of the extremity, while obstruction of the vessels above or below this level may be crippling.[1] There are certain anatomic bottlenecks where loss of arterial continuity is especially serious. In general, these bottlenecks are close to the joints of the extremities, since it is at these points that the collateral vessels are most vulnerable. For instance, it is recognized that loss of the superficial femoral artery rarely leads to gangrene in comparison with obstruction of the common femoral or popliteal. Similarly, in the upper extremity, the axillary artery distal to the branches about the shoulder joint and the brachial artery distal to the profunda can be ligated with impunity, whereas sacrifice of the vessel immediately above these collaterals frequently leads to serious vascular insufficiency. The importance of the anatomic location of the arterial injury is borne out by the statistical analyses of DeBakey and Simeone.[2]

DIAGNOSIS

The diagnosis of acute arterial injury should be made at the earliest possible time so that proper treatment can be instituted. Delay may lead to progressive thrombosis of the artery distal to the point of obstruction, with occlusion of collateral vessels. In addition, anoxia from ischemia may produce irreversible alterations in the tissues, especially nerve and muscle. Griffiths,[5] emphasizing the importance of early diagnosis stated, ". . . preventive treatment must be early, since the fate of the infarcted muscle is decided in hours and not days."

Of great significance in the early diagnosis of acute arterial injury is the appearance of the extremity. Extreme pallor or blanching is an important early sign. Palpation of the peripheral pulses should be part of the routine examination of every injured extremity. The general circulatory depression associated with shock may make it difficult to feel the peripheral pulses. Oscillometry will serve to confirm the information obtained from palpation of the pulses. In case an oscillometer is not available, an ordinary blood pressure apparatus will suffice. The movements of the column of mercury or the oscillations of the needle of an aneroid manometer when the cuff pressure is set at about diastolic blood pressure will give reliable information. Loss of sensation in the distal parts of the extremity, especially when associated with severe pain, is of value as an early sign. In fact, ". . . excessive pain on admission of a well-splinted fracture should make one suspicious of traumatic arterial spasm" (Clark[6]).

Frequently, the attendant lesions of bone or nerve are more dramatic and the vascular injury will be overlooked unless special attention is directed toward an evaluation of the circulation. An injured artery does not show up on the roentgenogram. Auscultation is important, especially in penetrating wounds. A systolic bruit is characteristic of a false aneurysm, though it may not be audible for the first few days after injury.[7] A continuous bruit accentuated in systole is typical of the communication between an artery and a vein.

It is essential to distinguish the false aneurysm from the arteriovenous fistula since the prognosis and treatment of these two conditions differ widely. The pressure within the sac of a false aneurysm is high.[8] There is a greater tendency to expansion or to rupture. The expansile quality produces damage to contiguous nerves and obstructs the collateral vessels. By contrast, the intrasaccular pressure in the presence of an arteriovenous fistula is low and the very existence of the communication between the artery and the vein is a stimulus for the development of collateral circulation. It is advisable to postpone operation on an arteriovenous fistula for two to three months to allow time for the development of collateral circulation. Occasionally, in the presence of a large fistula, the increased strain placed on the heart from diversion of large quantities of blood into the venous side of the circulation will necessitate earlier operation.

TREATMENT

A. Immediate Treatment.—Arrest of hemorrhage is the first requirement in the treatment of an acute arterial injury; ". . . important as is the salvage of a limb, the salvage of life necessarily takes precedence of it."[2] Unfortunately, the tourniquet frequently comes first to mind as the means of arresting hemorrhage from an extremity. The tourniquet, however, unless used only as a temporary measure, invariably seals the fate of an extremity, since it cuts off all the collaterals. Direct pressure on the bleeding point is far more desirable, especially with elevation of the extremity.[9] The wound may be packed with gauze held on by a snug bandage. This gauze will have to be removed within two to four days and the hemorrhage may recur. It is advisable that preparations be made for exploration of the wound at the time that the gauze packing is removed. The introduction of hemostatic absorbable material, such as oxycel[3] gauze, may be more advantageous. Direct application of forceps to the severed artery may be a life-saving measure. These forceps can be left in situ and removed when facilities are available for exposure of the vessel. In the presence of a tangential wound of the artery, however, the application of forceps precludes the possibility of repair. All these measures for the arrest of hemorrhage should be given preference, and the tourniquet reserved to the last. Its use is a confession of failure.[10]

Restoration of both the volume and the hemoglobin content of the blood is essential, especially when the main arterial channel is permanently interrupted. Low blood pressure and reflex vasoconstriction prevent the full functioning of the collateral pathways. Persistence of anemia and hypoproteinemia will delay wound healing.

B. Early Operative Treatment.—As soon as facilities are available, débridement of the wound, with excision of devitalized and traumatized tissues, should be undertaken. The injured vessel should be exposed by extending the original wound. Temporary control of the main artery is essential, especially when dealing with a pulsating hematoma or secondary hemorrhage. Proximal ligation of the artery above the point of injury should be avoided, since the bleeding will often recur and collateral vessels are needlessly sacrificed. After adequate exposure, rubber tubes or rubber-shod arterial clamps are placed about the artery both proximally and distally to control the bleeding. The point of injury can then be sought in a dry field without the danger of injury to accompanying nerves or other important structures.

Restoration of the blood flow through the original channel is the ideal form of treatment. The damaged portion of the vessel wall should be carefully excised and the adventitia removed for a distance of 1 to 2 cm. from the edges of the incision. The vessel should be carefully irrigated with isotonic sodium chloride solution containing 10 mg. of heparin in 100 cc. of solution. The defect should then be closed intima to intima with nonabsorbable suture material, which has been thoroughly oiled, on a fine, curved atraumatic needle. It is advisable where possible to suture the vessel transversely in order not to restrict the lumen. A continuous everting mattress suture interrupted at three places is most satisfactory. Experience with arterial suture either on the cadaver or in the experimental laboratory is necessary.

Arterial repair was found to give the most satisfactory end results of any method of restoration of the circulation in the cases analyzed by DeBakey and Simeone.[2] It was possible, however, in only a small proportion of the cases. Generally, the trauma was so extensive or there was such widespread destruction of the wall of the blood vessel that suture repair could not be used. End to end anastomosis was likewise impossible because of separation of the two ends of the vessel. Insertion of a vein graft either by means of suture or by the nonsuture technic with the use of cobalt-chromium alloy (vitallium®) tubes proved to be disappointing in more than half the cases. Plastic tubes, such as those of methyl methecrylate (lucite®) used by Hufnagel [11] in the experimental laboratory, may in the future provide a method of bridging over an arterial defect at least temporarily. Any means by which the arterial circulation can be reestablished is worth while in that time may be gained for the development of collateral circulation.

C. General Treatment of the Ischemic Extremity.—The treatment of the ischemic extremity resolves itself into means which will allow the maximum arterial inflow and, at the same time, the minimum metabolic demands of the tissues. The limb should be kept horizontal, at or slightly below the level of the heart. Direct application of heat should be scrupulously avoided, since raising the temperature of the part only increases the metabolic demands, while the volume of inflow is limited by the arterial occlusion.[12] The limb should be kept in a cool environment, but refrigeration by the use of ice packs should be avoided unless amputation of the extremity is inevitable. Excessive cold injures the tissues.

The use of a circular plaster encasement in the treatment of a fracture in a limb with impaired circulation is hazardous. The margin of safety between the pressure in the collateral vessels and the pressure in the tissue spaces is so narrow that the addition of even a slight amount of pressure from without may shut down the arterial supply completely. Again, frequent inspection and examination of an ischemic limb is necessary. Immobilization by means of a posterior plaster shell, or even skeletal fixation or traction, is preferable to a circular plaster encasement.

Sympathetic block by the paravertebral injection of procaine hydrochloride is of help in overcoming the peripheral vasospasm so frequently associated with arterial injuries. These injections should be repeated every twelve hours. The administration of whisky is useful in producing relaxation of peripheral blood vessels. In the presence of traumatic arterial spasm, papaverine in doses of ½ grain (0.03 Gm.) every four hours is of help. Cooper and his associates,[13] in experimental work on the administration of tetraethylammonium chloride in dogs after resection of the terminal aorta, showed that a high percentage of recovery followed the use of such a general vasodilator. Clinical experience in the treatment of obliterative arterial disease has demonstrated, however, that the blood flow through an ischemic extremity is not increased after the administration of a drug which acts on blood vessels throughout the body.[14] On the contrary, an actual diminution generally occurs, since the normal blood vessels open up more than those affected by disease. Thus the available blood flow is diverted away from the ischemic extremity. In general, however, it must be admitted that the results of chemical interruption of sympathetic vasoconstrictor impulses in the treatment of acute arterial injuries have not been dramatic.

Severe edema of the muscles of an extremity takes place with revascularization after prolonged ischemia. Since the muscle is contained within rigid enveloping fascia, this swelling is accompanied with a rise in interstitial pressure sufficient to cut off the collateral circulation. There may be no accompanying superficial edema, and the blood supply to the skin of the distal parts of the extremity may be sufficient to preserve the life of the part. Unless the tension within the fascial envelope is relieved, widespread necrosis of the muscles will result, leading to Volkmann's contracture. Parkes [15] made a notable contribution to the understanding of this condition. Longitudinal incision of the fascia should be performed to decompress the muscle that is in danger of infarction. Fasciotomy should be performed *early*, since ischemic nesrosis develops within a few hours. Damage to the nerves which course through the fascial compartment may likewise be prevented by early fasciotomy. When it is realized that a pressure of 60 to 70 mm. of mercury is sufficient to block the conduction of impulses through a nerve, it is apparent that increasing loss of sensation and paralysis are significant signs of compression.

D. Definitive Treatment.—Since this paper is concerned with acute arterial injuries, little will be said concerning definitive treatment. The incidence of gangrene following excision or repair of an aneurysm or arteriovenous fistula is extremely low. In a series of more than 1,000 cases treated in the Vascular Centers of the United States Army General Hospitals, there were only 2 cases of gangrene. Paradoxic as it may seem, the best safeguard for the survival of a limb is to permit an acute arterial wound to develop into an aneurysm. In the presence of an aneurysm, time must be given for the development of collateral circulation. Compression of the artery above an aneurysm by some mechanical device, such as a "Matas compressor," for increasing periods of time, stimulates the development of collaterals. Sympathectomy may also be performed as an elective procedure.[16] Collateral circulation develops spontaneously in the presence of an arteriovenous fistula, but, again, time is required. Unless there are urgent indications for intervention, it is better to wait two to three months before instituting definitive treatment.

As long as neither the patient's life nor the life of the extremity is in danger, it is better to wait. Only the prospect of death from hemorrhage or the probability of a crippled ischemic limb warrants early intervention. The first secondary hemorrhage is not usually fatal, but it should be regarded as a "red signal." It is an "inexorable indication for exploration of the wound."[7] As regards the functional state of the limb, progressive nerve damage, as shown by paralysis and increasing anesthesia of the distal parts, should be taken as an urgent indication for intervention.

CONCLUSION

The crippling effects of ischemia after acute injuries to the major arteries can be prevented only by early diagnosis and adequate treatment.

ABSTRACT OF DISCUSSION

Dr. Frederick W. Cooper Jr., Atlanta, Ga.: Dr. Freeman has so excellently covered this topic that there is little left for me to say, other than to reemphasize some of the points he has made. During the past few years in Atlanta my colleagues and I have seen increasing numbers of patients with acute arterial injuries who actually have no external wounds or only a trivial external wound which is remote from the site of the vascular occlusion. These patients usually have sustained fractures, particularly about the knee and the elbow. The arterial lesion is frequently overlooked, and the outcome is one of the grave ultimate results which Dr. Freeman has so accurately described. In patients with fractures, one should, of course, be aware of the possibility of arterial injury. Following the measures Dr. Freeman described, and after the use of sympathetic block, if the color of the extremity does not improve, exploration of the site of arterial injury should be carried out. We have seen patients in whom small spicules of bone penetrated the artery and produced thrombosis at that point. In many instances, the bone may be removed and the artery sutured. In fractures about the knee or in dislocation of the elbow joint, the vessel may be mechanically compressed, and, even though the fracture seems to be suitably reduced, the vessel may be damaged. We have seen a great number of patients with arterial injuries in whom the hemorrhage was controlled by means of packs. Packs are excellent as a temporary measure until the patient is prepared for some form of definitive treatment, but, here again, permitting a pack to remain in a wound several days almost invariably leads to disaster.

Dr. Harris B. Shumacker, New Haven, Conn.: Acut arterial injuries, though not common, are far more seriou than their statistical incidence would indicate because of th grave consequences which follow. Indeed, as pessimistic a are the figures of the consequent disasters when measured b the incidence of gangrene—the usual criterion—the results ar actually far worse, because many of the patients who surviv without gangrene have limbs crippled from ischemic paralysi of nerves or massive ischemia of muscle groups. Minor disturbances of circulation are even commoner. As Dr. Freema pointed out, one should aim at getting a blood supply to th injured part. A great deal has been learned about reparativ procedures on arteries in recent years. From the laborator standpoint it has been pretty well established that evertin mattress sutures offer a better chance of success than any othe method of suturing. There is little or no danger of the suture vessels leaking because of the pressure of the blood withi These vessels heal and regain their strength much in the sam fashion as do other tissues. We have gained a great deal o clinical experience in recent years because of the introductio of certain procedures in the correction of congenital defect of the heart and great vessels, and have optimism about reparative measures. The trouble lies in certain peculiarities of th acute vascular injuries. In the first place, in wartime, treatmen is usually necessarily delayed because of the military situatio In peacetime, delay is unfortunately the rule rather than th exception. In the second place, frequently the extent of injur is so great that anticoagulant therapy must be delayed for som time because of the hazard of bleeding, not from the suture vessel, but from other points of injury. I feel, as Dr. Freema does, that the management of acute injuries to arteries give us a pessimistic feeling at present, but, as he does, I feel that if all of us think more about these problems, if our confrère in the profession are more aware of the need for early treatmen and the proper measures to be instituted and if patients i general seek treatment early, some day someone from a platform such as this will be able to present far better result than have been obtained in the past.

Dr. Geza de Takats, Chicago: Dr. Freeman has describe the possibilities of acute arterial injuries graphically. Th treatment for acute arterial injuries should be grouped abou two distinct objectives. First, as Dr. Freeman has pointed ou hemorrhage should be arrested and antishock measures shoul be instituted. Second, suture of the artery is preferable t ligature. It is strange that while rupture of the intestine i being continuously repaired in all hospitals throughout th country, there is a great deal of hesitancy about repairing an suturing an arterial wound. Every operating room should hav 5-0 silk and a swedged needle, and, if at all possible, a sutur should be attempted. The importance of decompressing collateral circulation by fasciotomy can hardly be overemphasized What needs to be stressed is the triphasic treatment of an acute arterial occlusion; namely, papaverine intravenously, heparin intravenously and sympathetic block. Unless there are other possible visceral injuries, use of heparin is most important after hemorrhage has been arrested, since the small trickle of blood through insufficient collaterals or below the site of obstruction in the main trunk may clot easily and add to the degree of ischemia. The drug also protects the suture line in the artery. If heparin is needed in the extremity and not in the entire patient, it may be given intra-arterially, that is, kept in the extremity under a tourniquet. Following acute vascular injuries, especially the ones associated with tissue trauma, the patient's clotting tendency is increased and there need be no hesitation to give anticoagulant drugs. In the case of a growing, pulsating hematoma or a recognized arteriovenous fistula, anticoagulants are naturally not advisable. Venous grafts and temporary plastic tubes to bridge the gap will not be useful in the hands of the young general surgeon except after special training. The emergency treatment of acute arterial occlusions, however, will save many limbs with simple, readily available measures. If a limb is irrevocably lost, it may be packed in ice until the patient's nutritional status is improved, until blood has been replaced. However, the refrigeration of an extremity which could possibly be saved may well push it over into a gangrenous state. I should like to repeat a warning which is given all our residents: Never refrigerate an extremity as long as you expect to save it.

---

[16] Shumacker, H. B., Jr.: Sympathectomy as an Adjuvant in the Operative Treatment of Aneurysms and Arteriovenous Fistulas: I. Sympathectomy Performed Before or at Time of Operation, Surgery 22:571, 1947; II. Sympathectomy Performed After Operation, ibid. 22:597, 1947.

DR. FREEMAN: I have never seen an extremity saved which had received an arterial injury and was refrigerated. Refrigeration is an excellent measure as far as diminishing shock is concerned, but it will not save the extremity when there is an arterial injury. Another point which was brought up by Dr. de Takats is the question of shock. It is extremely important to establish an adequate circulating blood volume in these patients at the earliest possible moment in order to get circulation through the collateral vessels. Vasoconstriction in response to loss of blood will affect the collaterals just as it will normal blood vessels. Dr. Shumacker mentioned the laboratory experiments. Here again I feel the training program should be emphasized. It is only by actually working with blood vessels in the laboratory or in the cadaver that residents and fellows can get experience in taking care of vascular injuries. Of course, work on dogs is needed, also, and I put in at this time a plea for help on the problem of combating the activities of antivivisectionists. Dr. Cooper mentioned the compression injuries, which brings up the question of local segmental arterial spasm. Many times a blood vessel does not even have to be touched, and, if there is tension or traction, that vessel will go into spasm. Sometimes the spasm will last for long periods. Secondary thrombosis may take place. In experiments made with Dr. Frank Leeds at the University of California Department of Experimental Surgery last year, we found we could traumatize arteries in dogs, and provided we had a free flow across the line of the trauma we could destroy the intima over a distance of 1 cm. and still not get thrombosis. If a bulldog clip was applied so as to obstruct the circulation, then the deficient blood flow plus the injury led to thrombosis.

THE LEADING CAUSES OF DEATH AMONG PHYSICIANS

FRANK G. DICKINSON, Ph.D., Director
and
EVERETT L. WELKER, Ph.D.
Associate in Mathematics, Bureau of Medical Economic Research,
American Medical Association

The obituaries published in THE JOURNAL in 1948 and summarized in the editorial in the January 22 issue of THE JOURNAL [1] furnished data on which could be based an analysis of the leading causes of death among physicians, and a comparison of these leading causes with those of the population of the United States in general. Only 3,167 of the 3,230 reported deaths are analyzed, since the causes of death for 63 physicians were not reported.

The seven leading causes of death in the general population are: diseases of the heart, cancer, intracranial lesions of vascular origin (cerebrovascular), accidents, nephritis, pneumonia and influenza, and tuberculosis. These are not the same as the seven leading causes of death among physicians. For example, arteriosclerosis, diabetes and cirrhosis of the liver each caused more deaths among physicians than tuberculosis. For purposes of comparison with other published studies, particularly the bulletin, "What Is the Leading Cause of Death? Two New Measures," [2] we will analyze the seven causes of death mentioned, and the remaining causes will be grouped under the caption "All Others."

The average ages at death of physicians for 1948 and the white male population for 1945 are presented in table 1. The average age at death for the age-adjusted population (column 3) will be discussed later. White male population figures were used for comparison because of the small percentages of females and nonwhite persons in the physician population. Race and sex adjustments would not be large enough to alter the conclusions. Since only a small number of physicians are below the age of 25, their average age at death was much higher than the average age at death of the general white male population (column 1); for example, the pneumonia victims among physicians died at an average age of 74.3 years (column 2). This was much higher than the average age at death for deaths due to pneumonia in the general white male population because of the large number of deaths from this cause which occur during the first year of life. The average age at death of tuberculosis victims was 64.5 years for physicians, about fifteen years above that for the white male population. The lowest average age at death was for accidents, 57.2 years, about fourteen years above that of the white male population. The other causes of death, heart disease, cancer, cerebrovascular disease and nephritis, resulted in average ages at death in the high 60's and low 70's, values not far above those of the general population, since these "older" causes of death are concentrated at the higher ages. The age distribution curves for each of the causes of death among physicians tend to be typical of those developed by the "older" causes, a peak occurring at a high age and a long tail extending toward the low ages. The small number of cases for some of the causes does not allow a complete definition of the typical curves for these causes.

ACTUAL VERSUS EXPECTED DEATHS

In order to compare the relative number of deaths from the leading causes among physicians with the corresponding figures for the white male population, it is necessary to adjust for the fact that the age distributions are decidedly different. This adjustment can be made by applying age-cause specific rates of mortality for the white male population to the age distributions of physicians.[3] The numbers and percentages resulting from these calculations are shown in table 2, columns 4 and 5, for the causes listed. We shall refer to these figures as the expected number of deaths among physicians. The actual numbers and percentages of deaths among physicians are shown in columns 1 and 2 of table 2. Since the published obituaries include some deaths which did not occur in 1948 and omit others because the reports were not received in time, it is impossible for us to make direct comparisons between the actual and expected numbers of deaths, either in total or in age-cause classes. Consequently, available data do not furnish observed age-cause mortality rates. We can, however, analyze the relative importance of the causes of death and the average ages at death of persons dying from the different causes. It is assumed that the age distributions are not materially biased by underreporting.

Virginia Van Heule Horan, Research Assistant, coded the causes of death and made the machine computations.

[1] Obituaries of Physicians Published in 1948, editorial, J. A. M. A. **139**: 230 (Jan. 22) 1949.

[2] Bulletin 64, Bureau of Medical Economic Research, Chicago, American Medical Association, 1948.

[3] We used the mortality rates for white males which were calculated from figures shown in Vital Statistics of the United States, Part I, 1946, Federal Security Agency, United States Public Health Service, 1948, pp. 18 and 110. For example, there were 144.6 heart deaths per 100,000 white males aged 40 to 44. On July 1, 1948 there were 25,549 physicians in this age group. This means that we would expect 36.9 deaths from heart diseases among physicians aged 40 to 44, if their death rate were exactly the same as that of the white male population (25,549 × 144.6 ÷ 100,000 = 36.9). Similar calculations for each age group and for each c[illegible] furnish the expected number of deaths among physicians.

Heart disease is the first ranking cause of death as expected, but the observed percentage is high with deaths due to heart disease actually accounting for 42.2 per cent of the total; 38.9 per cent was expected. The deaths due to cerebrovascular diseases accounted for the second largest number, 12.3 per cent, and deaths due to cancer ranked third with 11.0 per cent of all deaths. This is contrary to expectation, which would have ranked cancer second with 13.3 per cent and cerebrovascular disease third with 9.5 per cent. Only a small percentage of deaths was attributed to each of the other causes, and the shifts in rank were relatively unimportant with the exception of nephritis, which actually ranked sixth and was expected to rank fifth, and tuberculosis, which has already been mentioned as being far below the expected value with an expected percentage of 3.1 and an observed percentage of 0.8. In view of the relationship between certain specialties and the frequency of deaths due to cancer as reported by Dublin and Spiegelman,[4] it is amazing that the deaths from cancer occupied only the third rank, below both heart and cerebrovascular disease. The observed cancer percentage was 11.0 as compared with an expected 13.3. This relatively low cancer death rate is probably due to the ability of the physicians recognize symptoms early and to begin thera promptly. Is the high death rate from heart dise due to the traditional unwillingness of the physicia to refuse to accept calls at all hours even though t result is loss of sleep and irregularity of meals? Or emotional strain? Whatever the explanation, he disease is in reality an occupational hazard of t medical profession.

Table 1.—*The Average Ages at Death by Cause*

Cause	1945 White Male Population * (1)	Physicians † (2)	Age-Adjusted Population ‡ (3)
Heart	66.6	67.5	69.1
Cerebrovascular	69.6	70.4	71.6
Cancer	64.7	67.4	67.9
Accidents	43.3	57.2	57.6
Pneumonia	48.8	74.3	69.5
Nephritis	67.8	69.7	71.0
Tuberculosis	49.3	64.5	54.4
All others	44.5	66.2	65.6
All causes	57.8	67.3	67.5

* For 1945; from table 8, page 18, Bulletin 64. Comparable 1948 data for the white male population are not now available. Later averages were not calculated because the important comparison is between columns 2 and 3 rather than columns 1 and 2.

† These figures differ slightly from those reported for 1948 in The Journal,[1] because of the exclusion of the 63 cases in which the cause of death was not stated and because of a correction in the age at death of 1 physician reported after publication.

‡ Footnote 3.

Table 2.—*Numbers, Percentages and Ranks by Cause of Death for Physicians and the Age-Adjusted Population* *

Cause	Physicians			Age-Adjusted Population		
	Number (1)	Percentage (2)	Rank (3)	Number (4)	Percentage (5)	Rank (6)
Heart	1,338	42.2	1	1,546	38.9	1
Cerebrovascular	390	12.3	2	379	9.5	3
Cancer	348	11.0	3	527	13.3	2
Accidents	173	5.5	4	256	6.4	4
Pneumonia	126	4.0	5	143	3.6	6
Nephritis	105	3.3	6	250	6.3	5
Tuberculosis	26	0.8	7	125	3.1	7
All others	661	20.9	..	754	18.9	..
All causes	3,167	100.0	..	3,980	100.0	..

* The entries in columns 1 and 4 cannot be compared directly because of underreporting of deaths in The Journal. For internal comparisons use columns 2 and 5.

The differences between the observed and expect average ages at death were in some instances even mo striking than the percentage differences (table 1). T physicians who died from pneumonia were on t average considerably older than would be expect 74.3 years compared with 69.5 years (column 3). similar situation holds for tuberculosis, with the actu deaths occurring at an average age of 64.5 years co pared with an expected of 54.4 years. These differences are probably due to the ability of the physicians to recognize these diseases and follow the therapeutic procedures required. As anticipated, the average age at death among physicians dying as a result of accidents was surprisingly close to the expected value. It is particularly noteworthy that the average age at death from all causes of deaths among physicians differs insignificantly from the expected, 67.3 years observed and 67.5 years expected. This confirms the observations of Dublin and Spiegelman[5] that the mortality experience of physicians is comparable with that of the general white population. It is clear that the physicians give their patients the same quality of medical care as they themselves receive although the causes of death are different. Apparently the members of the medical profession cannot give their fellow members longer life than their patients enjoy.

Table 3.—*Percentage Distribution of Three Measures for Ranking the Causes of Death Among Physicians*

Cause	Number of Deaths		Life Years Lost		Working Years Lost	
	Percentage (1)	Rank (2)	Percentage (3)	Rank (4)	Percentage (5)	Rank 6)
Heart	42.2	1	42.4	1	35.6	1
Cerebrovascular	12.3	2	10.0	3	5.7	4
Cancer	11.0	3	10.4	2	8.6	3
Accidents	5.5	4	8.4	4	15.7	2
Pneumonia	4.0	5	2.7	6	1.8	6
Nephritis	3.3	6	2.9	5	2.4	5
Tuberculosis	0.8	7	0.9	7	1.3	7
All others	20.9	..	22.3	..	28.9	..
All causes	100.0	..	100.0	..	100.0	..

TWO NEW MEASURES

Two new measures for ranking the leading causes of death, life years lost and working years lost, were developed and explained in Bulletin 64.[2] The application of these two new measures to the causes of death for the entire population resulted in some striking changes in the ranking of the seven leaders. These changes were a result of wide variations which existed between the age distributions of deaths from the seven causes analyzed. In table 3 are presented the percentages and ranks of the leading causes of death among physicians by number of deaths, life years lost and working years lost. The percentages for life years lost

---

4. Dublin, L. I., and Spiegelman, M.: Mortality of Medical Specialists, 1938-1942, J. A. M. A. **137**: 1519-1524 (Aug. 21) 1948.

5. Dublin, L. I., and Spiegelman, M.: The Longevity and Mortality of American Physicians, 1938-1942, J. A. M. A. **134**: 1211-1215 (Aug. 9) 1947.

were almost the same as the percentages for number of deaths. The major difference occurred in cerebrovascular disease, which accounted for 12.3 per cent of the deaths but only 10.0 per cent of the life years lost. This change was sufficient to result in the ranking of cerebrovascular disease third and cancer second. Nephritis and pneumonia ranked fifth and sixth respectively by life years lost, a reversal of their ranks based on number of deaths. The percentages themselves were rather small. Accidents retained fourth rank, but the percentage was higher for life years lost than for number (8.4 and 5.5). By working years lost heart disease retained first place with 35.6 per cent, and accidents moved into second place with 15.7 per cent. The percentage for cancer dropped to 8.6, to place it in third position, and the other causes trailed with relatively small percentages.

Because of the restricted age distribution of physicians a sharp differentiation between younger and older causes was not found.[6] This restricted the variability between the three measures, number of deaths, life years lost and working years lost. The death toll attributable to accidents was understated by number of deaths as compared with working years lost, and, conversely, the relative importance of heart disease was overstated by number of deaths when compared with working years lost. The high percentage attributed to accidents by working years lost was due to the low ages involved; the relatively high percentage of working years lost from deaths due to heart disease was maintained because of the large number of deaths involved in spite of the high average age at death.

It therefore seems safe to say that only accidents plays the role of an important younger cause of death among physicians and its importance is considerable in terms of working years lost; heart disease still constitutes a serious portion of the death problem for physicians; the physicians are alert to early recognition of their own symptoms of cancer; and the average age at death of physicians is no greater than that of the general population when adjusted for the differences in age and sex distributions. Although the causes of death are different for physicians, the net effect on length of life is negligible. The medical profession is apparently giving to the general population at least as much and at least as good medical care as it is giving itself.

---

6. Causes of death are classified as younger and older causes on the basis of the average age at death.

Auscultation of the Heart.—To be sure, auscultation sheds very little light on whether the heart is failing or not. The only stethoscopic finding that indicates heart muscle incompetency is a diastolic gallop or possibly an alteration of ventricular systole. But what must not be overlooked is that many patients have organic heart disease, especially valvular disease, for many years before they have heart failure. They often want to know and need to know, during these early years, whether they do or do not suffer from heart disease. In some of them auscultation is the simplest and occasionally the only method of answering this question, which is important notwithstanding the fact that during the period of normal compensation one would not advise cardiac medication or unduly restrict activities if a faint murmur of rheumatic aortic insufficiency is found. Such a patient might need prophylactic penicillin therapy for the extraction of teeth to protect him against bacterial endocarditis if aortic insufficiency were present, and would not if the heart were perfectly normal. This and other matters of considerable importance to the health of the patient depend on the accurate diagnosis of apparently minor abnormalities that auscultation may reveal.—Samuel A. Levine, Auscultation of the Heart, *British Heart Journal,* October 1948.

PENICILLIN PLASMA CONCENTRATIONS

Increase and Prolongation with Carinamide and Newer Depot Penicillin Preparations

WILLIAM P. BOGER, M.D.
and
HARRISON F. FLIPPIN, M.D.
Philadelphia

Although there is considerable difference of opinion regarding the therapeutic efficacy of bactericidal concentrations of penicillin for a brief time as opposed to the maintenance of bacteriostatic concentrations for prolonged periods, it is not within the province of this paper to discuss the relative merits of these two approaches to penicillin therapy. Suffice it to say that there are authoritative proponents of both methods of treatment and there are good reasons for wishing to achieve very high levels, amounts measured in whole units of penicillin per cubic centimeter, and for maintenance of lower concentrations of a few hundredths to a few tenths of a unit per cubic centimeter for prolonged periods. It is the purpose of this paper to show how both of these requirements of therapy can be achieved.

ORAL ADMINISTRATION OF CARINAMIDE WITH PENICILLIN GIVEN INTRAMUSCULARLY

Penicillin is rapidly excreted by the kidneys, the major portion being excreted by the renal tubules.[1] The rapidity of this excretion is such that approximately 60 per cent of an injected dose is excreted within one hour, and in each succeeding hour 70 per cent of the remaining penicillin is excreted.[2] This extreme rapidity with which penicillin is excreted by the renal tubules makes difficult the maintenance of high concentrations of the antibiotic agent, so it is natural that one approach to this problem has been the inhibition of the tubular excretion of the antibiotic. Iodopyracet injection U.S.P. (diodrast®) [3] and para-aminohippurate,[4] commonly employed to measure tubular excretory function, have been found to inhibit the excretion of penicillin. More recently, carinamide [5] has been shown to behave similarly, and this drug has the advantage of being effective when administered orally.[6]

Investigation of a large series of patients to whom different doses of carinamide have been administered has demonstrated that the effectiveness of various

dosage schedules (ranging from 1.5 to 4.0 Gm. every three hours) depends on the plasma concentration of carinamide attained. Since carinamide is rapidly absorbed from the gastrointestinal tract and is rapidly excreted by the kidneys by way of glomerular filtration, the level of the drug in the circulating body fluid is dependent in large measure on the patient's renal function. Persons having some degree of renal impairment may, therefore, show high concentrations of carinamide in plasma (20 to 30 mg. per hundred cubic centimeters) when 1.5 Gm. is given every third hour, whereas another may show a low concentration (1 to 5 mg. per hundred cubic centimeters) on the same schedule of therapy. The enhancement effect of carinamide on penicillin therapy is dependent on the attainment of an optimally inhibitory concentration of carinamide in in the plasma, currently stated to be 20 to 40 mg. per hundred cubic centimeters.[7] The daily dosage of carinamide required to maintain this concentration will depend both on the amount of drug given and the rate at which the patient's kidneys are able to eliminate carinamide. In the same patient small doses of the drug will produce partial, and larger doses complete, inhibition of excretion of penicillin by the renal tubules, the inhibition in either case being temporary and reversible.

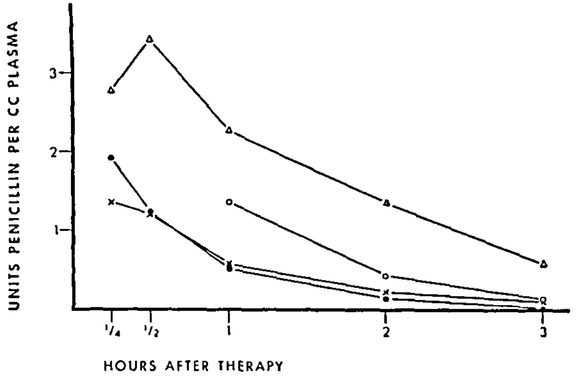

Fig. 1.—Graph showing effect of oral administration of carinamide on the intramuscular injection of 50,000 units of penicillin. The level of penicillin in the plasma without the use of carinamide is indicated by the solid dots. The level of penicillin in the plasma three hours after administration of 1.5 Gm. of the drug is indicated by circles, after 2.0 Gm., by X's, and after 3.0 Gm., by triangles.

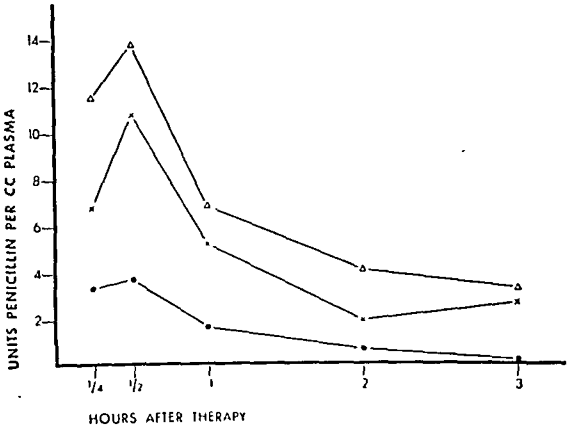

Fig. 2.—Graph showing effect of oral administration of carinamide on the intramuscular injection of 125,000 units of penicillin. The level of penicillin in the plasma without the use of carinamide is indicated by the solid dots. The level three hours after administration of 2 Gm. of carinamide is indicated by X's and after 3 Gm., by triangles.

The enhancing effect of carinamide on various schedules of penicillin therapy is shown in figures 1, 2, 3 and 4. It should be noted that crystalline sodium penicillin G in aqueous solution was used throughout these studies. The patients investigated had subacute bacterial endocarditis and were being treated with intermittent intramuscular injections of penicillin. Curves for response to doses were obtained in periods both with and without carinamide and in all instances the patients received penicillin or the combination of penicillin intramuscularly with carinamide orally for twenty-four hours prior to sampling of blood for penicillin assays. Each curve in the accompanying figures is an average for no less than 3 and no more than 10 patients. All penicillin assays were done by the modified serial dilution method of Rammelkamp.

Figure 1 shows that following the administration of 50,000 units of penicillin intramuscularly, the plasma penicillin concentration at one-half hour was 1.24 as compared with 3.43 units per cubic centimeter when 3 Gm. of carinamide was administered, approximately a threefold increase. At one hour, the difference was that between 0.54 and 2.28 units per cubic centimeter, a fourfold increase. At two hours, the difference was that between 0.17 and 1.37 units, an eightfold increase, and at three hours the difference was that between 0.02 and 0.61 unit per cubic centimeter with carinamide, a thirtyfold increase. Carinamide increased penicillin concentrations in the plasma by two to thirtyfold, the effect being most striking at the third hour following injection of the antibiotic agent. Lesser doses of 1.5 to 2.0 Gm. of carinamide every three hours gave in this group of patients less positive results because less than optimal plasma concentrations of carinamide resulted from these doses.

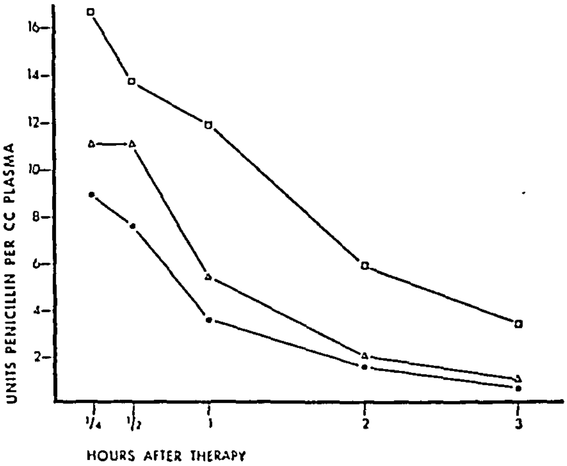

Fig. 3.—Graph showing effect of oral [illegible] on the intramuscular injection of 250,000 u[illegible] of penicillin in the plasma without the use o[illegible] the solid dots. The level three hours after administration of 3 Gm. of carinamide is indicated by triangles and after 4 Gm., by squares.

The effect of 2 and 3 Gm. doses of carinamide, administered orally every three hours, on 125,000 units of penicillin given intramuscularly is shown in figure 2. Two grams gave a threefold increase at one-half, one and two hours and a tenfold increase at three hours. With 3 Gm. of carinamide, the enhancement effects were threefold at one-half, fourfold at one, sixfold at two and thirteenfold at three hours.

---

[7] Boger, W. P.; Miller, A. K.; Tillson, E. K., and Shaner, G. A.: Caronamide: Plasma Concentrations, Urinary Recoveries and Dosage, J. Lab. & Clin. Med. 33: 297-308, 1948.

As seen in figure 3, similar observations were made with 200,000 units of intramuscularly administered penicillin, the enhancing effects varying from three to tenfold, the greatest enhancement effect again being observed at the third hour.

Figure 4 shows that the concomitant administration of 3 Gm. of carinamide with each injection of penicillin at three hourly intervals resulted in the difference between 14 and 34 units per cubic centimeter at one-half hour and the difference between 2.5 and 17.5 units per cubic centimeter of plasma three hours after the intramuscular injection of 500,000 units of penicillin.

Figure 5 summarizes the foregoing results. With carinamide, concentrations resulting from the intramuscular injection of 50,000 units of penicillin approximated those obtained following 125,000 units of penicillin alone. One hundred twenty-five thousand units plus carinamide gave values approximating those obtained following 500,000 units of penicillin alone, and, when carinamide was given in conjunction with 500,000 units, the results were equal to or exceeded the levels reported following the administration of 1,000,000 units of crystalline penicillin in aqueous solution. At lower levels of penicillin administration, increased values in the blood can be obtained most readily by simply administering larger quantities of penicillin, but when the requirements of therapy are measured in millions of units per day, it is more economical to take advantage of the enhancing effect of carinamide than to give larger doses of the antibiotic substance. In our experience carinamide in adequate dosage has given enhancement effects regardless of the amount of penicillin administered, the increase of plasma concentrations being most striking at two and three hours after the injection of penicillin; the dosage of carinamide for any particular patient is constant for any amount of penicillin injected. A survey of nearly 2,000 patients has shown that the toxicity of carinamide is slight, the only notable exception to this statement being nausea and vomiting, nausea having occurred in 14 per cent of the patients and vomiting in 6 per cent.[8]

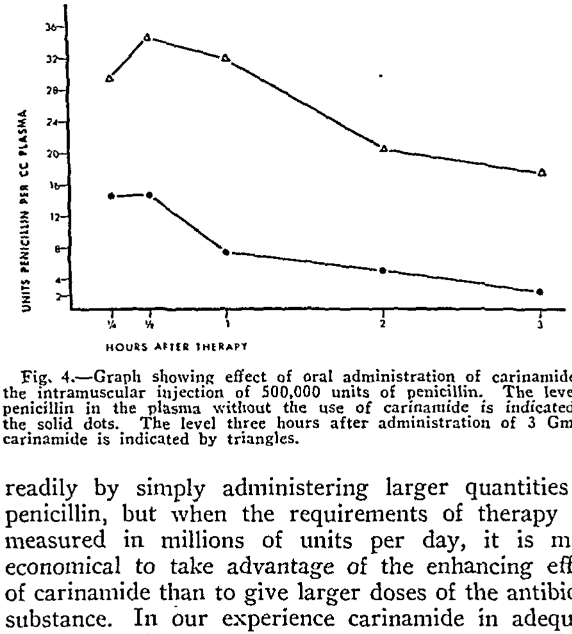

Fig. 4.—Graph showing effect of oral administration of carinamide on the intramuscular injection of 500,000 units of penicillin. The level of penicillin in the plasma without the use of carinamide is indicated by the solid dots. The level three hours after administration of 3 Gm. of carinamide is indicated by triangles.

DEPOT OR REPOSITORY PENICILLIN PREPARATIONS

Whereas the need of concentrations measured in units of penicillin per cubic centimeter is limited to the treatment of "infections relatively resistant to penicillin," a plasma concentration of a few hundredths, or certainly a few tenths, of a unit per cubic centimeter is sufficient for the treatment of the majority of commonly occurring infections. The depot or repository penicillin preparations, of which penicillin suspended in peanut oil and white wax U. S. P. is the prototype, appear to be applicable to the treatment of such infections. These preparations offset the rapid excretion of penicillin by the kidneys by slowing the rate of absorption from the site of their injection. Whereas the original interest in this type of preparation centered about the properties of the vehicle which might accomplish this retardation of absorption, much current interest is directed toward the investigation of salts of penicillin relatively insoluble in water, as well as toward improvement of suspending vehicles. Procaine penicillin has attracted wide attention and has, to date, proved to be the most practical of the insoluble salts of penicillin.

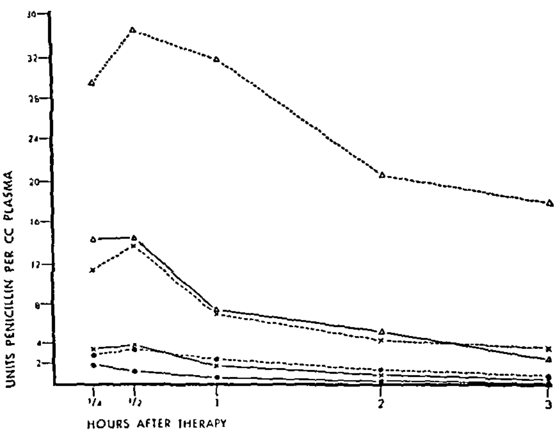

Fig. 5.—Graph showing effect of 3 Gm. of orally administered carinamide on various intramuscular doses of penicillin. The solid line shows the levels of penicillin in the plasma without carinamide and the broken line, the levels of penicillin with carinamide. The levels resulting from a dose of 500,000 units of penicillin are indicated by triangles, from 125,000 units, by X's and from 50,000 units, by solid dots.

---

[8] Boger, W. P., and Crosson, J. W.: The Toxicity of Carinamide: A Review of 1,997 Patients, to be published.

The results obtained following the intramuscular injection of 300,000 units of procaine penicillin in sesame oil[9] are compared in figure 6 with (*a*) plasma concentrations resulting from 300,000 units of penicillin in peanut oil and white wax and with (*b*) the results obtained by other investigators with procaine penicillin in sesame oil. Our values (the heavy solid line) are somewhat lower than those reported by other workers, but they were obtained in normal, afebrile, ambulatory patients and are in sharp contrast with those recorded for patients suffering from lobar pneumonia who were given injections of the same preparation.

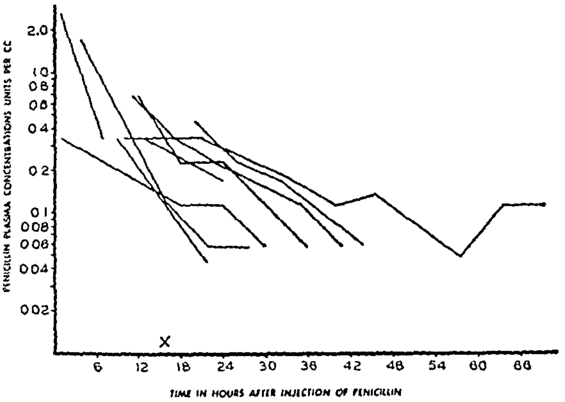

Fig. 7.—Each graph line corresponds with the plasma concentration observed in patients with pneumonia who received 300,000 units of procaine penicillin in sesame oil. The X indicates the concentration for a young man, aged 19, who failed to show any measurable quantity of penicillin in the plasma sixteen hours after its administration.

Each line in figure 7 corresponds with the plasma concentrations observed in a patient with pneumonia who had received 300,000 units of procaine penicillin suspended in sesame oil. Attention is called to the great individual variation observed. One patient, a woman 77 years of age, showed a concentration of 0.1 unit per cubic centimeter of plasma for seventy-two hours, whereas a young man, 19 years old (indicated by X on the figure), failed to show any measurable quantity of penicillin at sixteen hours.

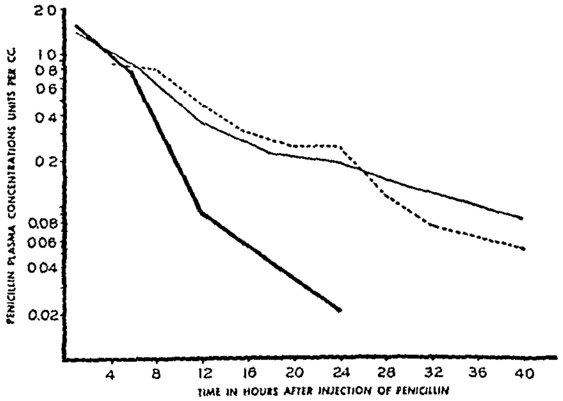

Fig. 8.—Graph showing penicillin levels in the plasma of normal persons and of patients with pneumonia after administration of 300,000 units of procaine penicillin in sesame oil. The heavy solid line indicates the level in normal persons, the thin solid line, that for patients with pneumonia, and the broken line, the average level reported by the various investigators.

In figure 8 the results obtained in these patients with pneumonia have been averaged and compared with (*a*) the average of results observed by other investigators (refer to figure 6) and (*b*) results observed by us in normal, afebrile and ambulatory patients. It seems clear that, whereas the plasma concentrations of penicillin following 300,000 units of procaine penicillin in sesame oil were maintained above a concentration of 0.03 unit per cubic centimeter for less than twenty-four hours in normal persons, the concentrations were maintained above 0.1 unit for forty hours when the same preparation of penicillin was administered to patients with pneumonia. The results observed in these patients agreed well with the average results of other investigators. It is suggested that illness modifies to a notable degree the period during which assayable quantities of penicillin can be demonstrated in the plasma: Results obtained should be evaluated, therefore, in the light of the type of patient to whom penicillin has been administered, as well as in terms of the type of penicillin used and the vehicle employed to suspend the penicillin.

Aluminum has the interesting property of retarding the absorption of many antigens, and it is natural that it should have been investigated in connection with efforts to delay the absorption of penicillin. In the same patients a comparison, as shown in figure 9, was made between the plasma concentration resulting from the intramuscular injection of 300,000 units of aluminum penicillinate suspended in peanut oil[10] and crystalline potassium penicillin suspended in aluminum monostearate and peanut oil.[11] The resulting concentrations are in turn compared with results following the injection of penicillin in oil and white wax and procaine penicillin in sesame oil. The results indicate that an aluminum gel employed as a vehicle serves to delay the absorption of penicillin from the site of its injection better than the incorporation of aluminum and penicillin in the same molecule. The difference was most striking during the first forty-eight hours, and, at the end of ninety-six hours, plasma concentrations of penicillin were approximately 0.03 unit per cubic centimeter with both preparations.

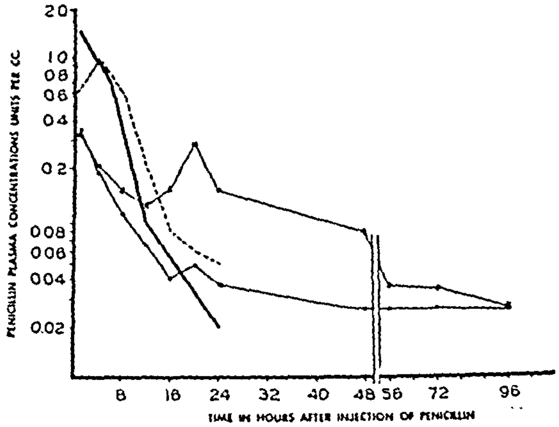

Fig. 9.—Graph showing penicillin levels in the plasma of patients given 300,000 units of both crystalline potassium penicillin in aluminum monostearate and peanut oil and aluminum penicillinate in peanut oil. The X's indicate the level with potassium penicillin in aluminum monostearate and peanut oil; the solid dots, that with aluminum penicillinate in peanut oil; the heavy solid line, that with procaine penicillin in sesame oil, and the heavy broken line, that with penicillin in peanut oil and white wax.

---

[9] Procaine penicillin suspended in peanut oil, duracillin,® was supplied by Eli Lilly & Company, Indianapolis 6.

[10] The aluminum penicillinate used in this investigation was supplied by Hynson, Westcott & Dunning, Inc., Baltimore. Aluminum penicillinate is a trivalent aluminum salt and not a mixture.

[11] This investigational material was supplied by the Medical Research Division of Sharp & Dohme, Inc., Glenolden, Pa.

Procaine penicillin was suspended in the same aluminum monostearate and peanut oil vehicle that gave this excellent result with crystalline potassium penicillin, and prolongation of measurable penicillin plasma concentrations for one hundred and forty-four hours (six days) was observed, as may be seen in figure 10.

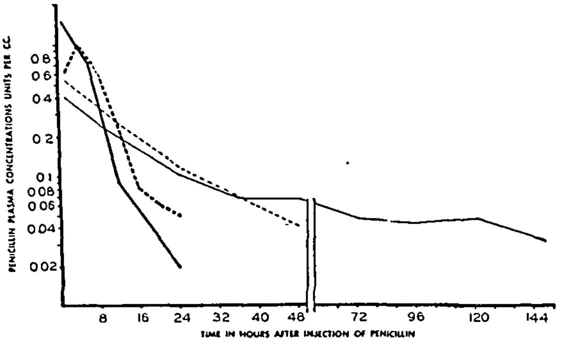

Fig. 10.—Graph showing penicillin levels in the plasma of patients given 300,000 units of procaine penicillin suspended in aluminum monostearate and peanut oil. The results of the present study are indicated by the light solid line, the results reported in the literature by the light broken line, the results obtained on administration of procaine penicillin in sesame oil by the heavy solid line and those obtained on administration of penicillin in peanut oil and white wax by the heavy broken line.

There is a good correlation between our results (the light solid line) and those reported by other investigators who studied a preparation of like composition (the light broken line). These results are once again compared with those obtained with procaine penicillin suspended in sesame oil (heavy solid line) and penicillin in oil and white wax (heavy broken line).

Figure 11 shows the extent to which plasma concentrations resulting from 300,000 units of penicillin are modified by both the salt of penicillin employed and the vehicle used to suspend the particular penicillin salt. Each line represents the average plasma concentrations of no less than 9 and no more than 100 patients. All these data were obtained in normal, afebrile, ambulatory persons, a fact worthy of emphasis in view of the difference between results in normal persons and those in patients with pneumonia indicated earlier in this presentation (fig. 8). Three hundred thousand units of crystalline penicillin in aqueous solution can be expended rather lavishly to give transitory and relatively high penicillin concentrations, or it can be suspended in an aluminum monostearate gel to give lesser concentrations maintained over many hours. The procaine salt of penicillin, comparatively insoluble in water, can be suspended in sesame oil to give plasma concentrations for somewhat less than twenty-four hours, or it can be suspended in an aluminum monostearate gel to give measurable amounts of antibiotic activity in the plasma for from four to six days. Accepting as a criterion the plasma concentration of 0.03 unit per cubic centimeter that has been given wide recognition as being therapeutically significant, a single injection of 300,000 units of procaine penicillin in aluminum monostearate and peanut oil results in effective therapy of many infections for four to six days. This has been confirmed by the successful treatment of a series of patients with pneumonia with a single injection of 300,000 units of this penicillin preparation.[12] It should be stated that all the plasma concentrations of penicillin shown in figures 7, 8, 9, 10 and 11 were determined by a modification of the serial dilution method of Rammelkamp, and the presence of penicillin was established by duplicate determinations in which penicillin activity was inhibited by penicillinase.. These values have not been corrected for plasma binding, a correction that would nearly double the values here presented.

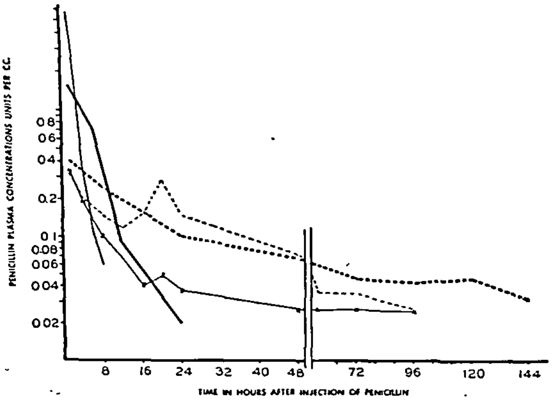

Fig. 11.—Average penicillin concentrations in the plasma of patients given 300,000 units of various penicillin preparations. The light solid line indicates the level from crystalline penicillin in aqueous solution; the heavy solid line, that for procaine penicillin in sesame oil; the light broken line, that for potassium penicillin in aluminum monostearate and peanut oil; the heavy broken line that for procaine penicillin in aluminum monostearate and peanut oil, and the X's, that for aluminum penicillinate in peanut oil.

CONCLUSIONS

Any desired concentration of penicillin can be achieved by the simple expedient of using enough penicillin to attain it, but, when the desired concentration requires the use of millions of units of penicillin, it is both reasonable and economical to employ carinamide. Adequate doses of carinamide administered orally in conjunction with penicillin result in two to thirtyfold enhancement of plasma concentrations following any given dose of penicillin. This drug produces its effect by physiologically inhibiting the renal tubular excretion of penicillin.

Repository penicillin preparations depend for their efficacy on a delayed rate of absorption of penicillin from the site of injection. Of those preparations currently available, procaine penicillin in aluminum monostearate gel and peanut oil gives measurable quantities of penicillin in the plasma over the longest period, four to six days.

ABSTRACT OF DISCUSSION

Dr. Wallace E. Herrell, Rochester, Minn.: Dr. Boger divided the presentation into two parts. One has to do with the elevation of plasma levels of penicillin by the blocking of renal excretion. Several drugs for the accomplishment of this purpose have been tried, namely, iodopyracet injection and para-aminohippuric acid, but carinamide is the most effective to date. My colleagues and I carried out several studies on carinamide. We were using the recommended dose of 1.5 Gm. every three hours but were unable to demonstrate any notable retention of penicillin. It was only after we used the larger dose, namely, 3 Gm. every three hours, such as Dr. Boger and Dr. Flippin recommend, that we obtained similar results. We did not use the material except in special situations; for example, in a case of subacute bacterial endocarditis or a similar infection which is fairly resistant to penicillin. At times, the use of carinamide makes it possible to treat these infections successfully and, at the same time, to conserve the supply of penicillin. This is of economic importance to the patient. I am sure Dr. Boger will agree that carinamide is not a substance to be used routinely. He mentioned the toxic reactions which may be encountered. Nausea and vomiting are troublesome. It is difficult for a severely ill patient, for example, one with subacute bacterial endocarditis, to take six tablets of this material every three hours. The second part of this presentation deals with prolongation of the action of penicillin by means of so-called depot penicillin preparations. We have been impressed with results after using procaine penicillin in sesame oil. In several thousand injections of this material, we have seen not more than half a dozen reactions. The material appears to have a threefold effect: (1) prolongation of action, (2) an anesthetic effect and (3) some so-called antihistaminic effect, since it appears that the allergic reactions are definitely decreased. My colleagues, Dr. Nichols and Dr. Heilman, have also investigated the possibilities of procaine penicillin to which has been added 2 per cent aluminum monostearate. I believe that the concentrations of this preparation persist in the blood for an average of about seventy-two hours. They have not found the prolongation to last for four or five days. This is not a contradiction of Dr. Boger's results; it is simply a matter of our experience. I am sure he will agree that all these preparations differ greatly and that, of course, the matter of individual variations among patients must be considered. Recently you have heard about the treatment of patients with aqueous solution of penicillin, an injection of which is given once daily. This method is effective when the condition treated is pneumonia or some Neisseria infection. However, I should much dislike to leave the impression that the injection of aqueous penicillin solution once or twice daily is a satisfactory method of treating severe or potentially severe infections, such as bacteremia or cellulitis with impending bacteremia. If the matter were that simple, there would be no need for excellent studies such as these presented by Dr. Boger and his colleagues.

[12] Boger, W. P.; Ortt, J. E.; Israel, H. L., and Flippin, H. F.: Procaine Penicillin G in Oil: I. Plasma Concentrations; Preliminary Observations on Its Use in Pneumonia, Am. J. M. Sc. 215: 250-256, 1948.

Dr. Boger: The application of carinamide to penicillin therapy in general is indeed in question. Unless the daily requirement of penicillin is large, in excess of 500,000 units per day, the combined use of carinamide and penicillin intramuscularly is not justified. We should not wish to see carinamide used routinely. Those interested in improving depot penicillin preparations recognize that it is not alone the salt of penicillin or the vehicle but also the size of the penicillin particles that determines duration of penicillin levels in the blood. The influence of the size of crystal is not well understood, since in some preparations large crystals prolong levels and in others small crystals are more effective. A question frequently asked is whether or not carinamide has an enhancing effect on depot penicillins. It does, but in our opinion this is not a good application of carinamide. From an injection of a depot preparation penicillin is absorbed irregularly; plasma levels do not fall along a predictable curve as they do after an intramuscular injection of aqueous solution of penicillin; further, such preparations give low concentrations of penicillin in the blood, and these levels, though they be doubled or quadrupled, represent differences in concentration that fall within the error of methods of penicillin assay employed. The toxicity of carinamide has been mentioned. The daily dose of the drug is large, and nausea and vomiting are annoying, but we do not believe they constitute serious deterrents to the use of the drug.

The Aztecs and Smallpox.—In 1520 when the Spaniards came to Mexico, one of the Negro slaves accompanying the army transmitted smallpox to the Mexican Indians. Within a few years, more than 3,000,000 Indians died of smallpox, and the once mighty Aztec population was reduced to a small group of shaken beggars.—R. L. Mayer, Epidemics and Bacteriological Warfare, *The Scientific Monthly,* November 1948.

SYNDROME OF SALT DEPLETION

Induced by a Regimen of Sodium Restriction and Sodium Diuresis

LOUIS A. SOLOFF, M.D.
and
JACOB ZATUCHNI, M.D.
Philadelphia

The recognition of the importance of the retention of sodium in the aggravation or in the production of the phenomena of congestive heart failure has directed attention to methods that will diminish the sodium content of the body in the therapy of disorders characterized by these phenomena. Two procedures are used to accomplish this purpose. One procedure consists of the use of a diet that is extremely poor in salt. It is now possible to remove salt which is naturally present in foods so that diets may be prescribed that have all the essential foodstuffs and yet are extremely poor in sodium. The other procedure is the use of powerful diuretics that produce a disproportionately greater excretion of sodium chloride than of water. In clinical practice, both procedures are frequently used together. There can be little doubt of the efficacy of this regimen and that the introduction of this therapy represents a great advance in the treatment of heart failure. It is our impression that this regimen, judiciously used, has considerably improved the prognosis and relieved the symptoms of persons suffering from congestive heart failure. Nevertheless, in recent months we have seen increasing instances of persons with hypertension or with congestive heart failure who, while receiving intensive therapy of this sort, experienced symptoms that are very similar if not identical with those of salt depletion as seen in the noncardiac patient who is subjected to considerable loss of sodium during a short interval. We were particularly impressed by 4 deaths occurring in one month that we believe were due in great part, if not entirely, to this therapy. The purpose of this report is to call attention to the possible disastrous effects and even fatal outcome in persons with congestive heart failure and with hypertension who have been overtreated with mercurial diuretics, with excessive salt restriction, or with both procedures.

REPORT OF CASES

Case 1.—S. G., a 52 year old man, had had rheumatic heart disease for many years. For many months, he had been on a salt-poor diet and for a few weeks had received intramuscular injections of 2 cc. of meralluride sodium solution (mercuhydrin sodium solution®) twice weekly. He had also been given a maintenance dose of digitoxin. On April 28, 1948, he became nauseated, started to hiccough and became short of breath. He was admitted to the hospital with a diagnosis of congestive heart failure and possible pneumonitis. Physical examination revealed typical rheumatic mitral stenosis; the liver was palpated 5 fingerbreadths below the costal cage, and the neck veins bulged. His skin was cold and moist. The pulse was feeble and rapid. He was dyspneic. He was given oxygen, a maintenance dose of digitalis, ammonium chloride, 1 Gm. four times a day, and penicillin. He remained on a salt-poor diet. Because of persistent dyspnea and restlessness, he was given 2 cc. of meralluride sodium solution intramuscularly on April 28. On April 29, vomiting began. Blood pressure cuffs inflated above the venous pressure were placed on all four extremities for several hours on each of the following two days. On April 30, the blood urea nitrogen was 98 mg. per hundred cubic centimeters of blood. On May 5, 2 cc. of meralluride sodium solution and 1,000 cc. of 5 per cent dextrose

in distilled water were given intravenously. On May 7, 2 cc. of meralluride sodium solution were again given intravenously and a venesection was performed. The blood pressure was unobtainable. Later that day, the blood urea nitrogen was 65 mg. and the blood chloride 306 mg. per hundred cubic centimeters of blood. The patient died soon after intravenous administration of isotonic sodium chloride solution had been started.

Comment.—The high level of urea nitrogen in the blood soon after the patient's admission should have led to the diagnosis of dehydration or primary renal disease. Either diagnosis would have contraindicated further use of mercurial diuretics or other drastic attempts at dehydration that were continued in an attempt to control dyspnea that was apparently regarded as due to severe pulmonary congestion.

CASE 2.—N. R., a 47 year old Negro, had had rheumatic heart disease for years, but symptoms of shortness of breath first developed in January 1948. He entered the hospital on April 5, to determine the cause of pain in the epigastrium and of loss of appetite. He was not acutely ill. Results of studies of the gastrointestinal tract and of the gallbladder were negative. The pain was apparently thought to be due to a congested liver. On April 10, ammonium chloride therapy, 1 Gm. four times a day, was started; 2 cc. of meralluride sodium solution were given on April 11, 13 and 17. The patient became dyspneic and toxic. On April 22, 1,000 cc. of 5 per cent dextrose in distilled water were given intravenously. The same day, the blood urea nitrogen was 88 mg. per hundred cubic centimeters of blood. On April 24, the blood chloride was 311 mg. per hundred cubic centimeters of blood. Intravenous administration of 5 per cent dextrose in isotonic sodium chloride solution was started on April 27, but the patient died on the following day.

Comment.—This patient entered the hospital primarily for diagnosis. During an intensive dehydration regimen, he became toxic and died.

CASE 3.—J. W., a 41 year old man, had had rheumatic heart disease for two years. Symptoms of congestive heart failure developed and the patient was hospitalized at another institution, where he was digitalized, placed on a salt-poor diet and given frequent (daily ?) injections of meralluride sodium solution. At the end of three weeks, constant nausea and vomiting developed. He was discharged at his own request. At home, the same dehydrating measures were used. Nausea and vomiting became worse. He was admitted to the Temple University Hospital on April 7. He had typical rheumatic mitral stenosis, cold clammy skin and a feeble pulse. The systolic blood pressure was at times unobtainable, and it never was above 100 mm. of mercury. The liver was enlarged 5 fingerbreadths below the costal cage, and the neck veins were distended. The patient was dyspneic, nauseated and retched and vomited. Occasionally he expectorated blood. He was placed in an oxygen tent. Treatment with digitalis was continued. Intramuscular and intravenous injections of vitamins were given. The diet remained salt poor. Because food taken by mouth could not be retained, protein hydrolysates (amigen®), in 500 cc. amounts, were cautiously given intravenously and tolerated surprisingly well. On May 12, the blood chloride was 284 mg. per hundred cubic centimeters of blood. Intravenous administration of isotonic sodium chloride solution was cautiously started on that day. He received 250 cc. on May 14, and on May 16, 500 cc. were given. The blood chlorides remained low, being 288 mg. on May 13 and 285 mg. on May 14. Blood sodium on May 14 was 127 milliequivalents per liter of blood (normal value in our laboratory is 140 to 150 milliequivalents per liter). The week end interfered with further laboratory studies. However, after the first injection of isotonic sodium chloride solution the patient appeared more restful. The skin became warm and lost its moisture. The systolic pressure rose above 100 mm. of mercury. On May 14 he began to retain food by mouth. On Sunday, May 16, he lapsed into coma; he died the following day, apparently of a cerebral accident.

Comment.—This case illustrates that a low blood chloride level and, indeed, a low blood sodium level may be present with the phenomena of congestive heart failure. In spite of the extremely low value for sodium, the liver and neck veins were decidedly engorged.

CASE 4.—J. T., a 35 year old man, had had heart disease for many years. The nature of the heart disease was unknown. For six months he had been treated with a salt-poor diet and injections of meralluride sodium solution and digitoxin. These injections were at first given once in two weeks and then increased in frequency to twice a week. Fatigue and exertional dyspnea increased. He was admitted to the hospital on April 13, 1948. Treatment with the salt-poor diet and digitoxin (0.2 mg. daily) was continued, and 2 cc. of meralluride sodium solution were given intravenously daily from the day of admission to April 24. Dyspnea slowly increased. The patient became very thirsty, but the throat was extremely dry and he could swallow only with difficulty. The blood urea nitrogen rose to 65 mg. per hundred cubic centimeters of blood. Pulmonary infarction developed; the patient became icteric and died on May 2.

Comment.—Unfortunately, no blood chloride determination was made. There can be no doubt, however, from the clinical picture and the blood urea nitrogen that he was dehydrated. Pulmonary infarction was the terminal cause of death, but dehydration measures not only did not relieve the dyspnea but actually increased it and made the patient more toxic. It appears to us that he would have been well on the road to death even in the absence of pulmonary infarction if the therapeutic regimen had been continued.

These 4 patients all died. We have seen many other instances of this condition in which the syndrome of hyponatremia was recognized quickly and the patients recovered. The following abstracts are illustrative.

CASE 5.—H. S., a 39 year old woman, had had rheumatic heart disease for years and had been on a salt-poor diet for many months. She was admitted to the hospital because of complicating pneumonia, which was controlled within two days by penicillin. Because of persistent slight dyspnea, she was given ammonium chloride, 1 Gm. four times a day, and, two days later, 1 cc. of meralluride sodium solution intramuscularly. A copious diuresis occurred. That evening she became nauseated and pale. The skin was cold and clammy. The blood pressure had dropped below its normal level. The patient appeared to be going into shock. A small amount of salt by mouth was suggested. The following morning, when the patient had already lost the acute symptoms, the blood urea nitrogen was 48 mg. and the chloride 339 mg. per hundred cubic centimeters of blood. Two days later, the blood urea nitrogen and chlorides had returned to normal.

CASE 6.—A. J., a 40 year old man, was admitted for sympathectomy for severe hypertension. He had previously been placed on a salt-poor diet and had been digitalized. One week after the first stage, increasing fatigue and apathy developed. The blood urea nitrogen was 70 mg. and the blood chloride 301 mg. per hundred cubic centimeters of blood. Treatment with 500 cc. of blood and an unknown quantity of isotonic sodium chloride solution restored his previous vigor and normal blood urea nitrogen and chlorides. One week after the second stage, he was again weak and apathetic and could not be persuaded to leave the bed. The blood urea nitrogen was 67 mg. and the blood chlorides 312 mg. per hundred cubic centimeters of blood. He was given 1,000 cc. of isotonic sodium chloride solution intravenously. The patient got out of bed that afternoon and was discharged five days later free of symptoms and with normal blood urea nitrogen and chlorides.

CASE 7.—G. W., a 49 year old man, had had hypertension for several years and had had two cerebral hemorrhages that had left him with a hemiplegia. He had been placed on a salt-poor diet. He was admitted to the hospital because of temperature of 99 to 100 F. and a mild infection of the urinary tract. The salt-poor diet was continued. Five per cent dextrose in distilled water was given intravenously to promote diuresis. Penicillin therapy quickly brought the infection under control, but the patient became irrational and semicomatose. On April 22, 1948, he appeared moribund. The blood urea nitrogen was 106 mg. and the creatine 4.6 mg. per hundred cubic centimeters of blood. His throat was parched, and it was impossible for him to swallow water in spite of extreme thirst. Intravenous administration of isotonic sodium chloride solution was begun on April 30. It was continued daily in amounts of 1,000 cc. He quickly improved. On May 9, the blood urea nitrogen was 14 mg. and the chloride 338 mg. per hundred cubic centimeters of blood. He was rational and was discharged free of symptoms except for the residual hemiplegia.

COMMENT

One of us (L. A. S.) had under his care a number of middle-aged women with rheumatic heart disease who had palpable livers and distended neck veins. They were semiinvalids but remained unchanged physically for longer than ten years. Attempts to dehydrate them with mercurial diuretics invariably led to symptoms of nausea, weakness and faintness, so that they would not permit such attempts again. In one week 3 patients were seen in consultation whose symptoms of nausea and fatigue were abolished by the withholding of mercurials which had been given to them repeatedly. In two instances, the family physician had withheld digitalis because it was thought that it was the offending drug.

The recognition of the syndrome of hyponatremia in persons with congestive heart failure and with hypertension following the institution of a salt-poor diet and the use of mercurial diuretics is not new. For a decade following the introduction of these powerful diuretics many papers appeared in the literature emphasizing the potential dangers of this type of therapy with particular reference to salt depletion and dehydration. Thus, Binger and Keith[1] reported that, of 216 persons with heart failure so treated, an increase in blood urea nitrogen developed in 89. Steiglitz[2] commented on the fact that many patients appeared more intoxicated after diuresis than when they were edematous. Srnetz[3] stressed the appearance of somnolence and mental confusion. Poll and Stern[4] observed the symptoms of weakness, restlessness, mental confusion, apathy and even coma and death following excessive diuresis. Klinghoffer[5] observed nausea, anorexia, muscle cramps and vascular collapse. Evans[6] was able to abolish the symptoms by stopping the use of diuretics and increasing fluids. DeGraff and Nadler,[7] in their review of the toxic effects of mercurials in human beings, mentioned the ocurrence of chloride depletion and azotemia after diuresis.

It would appear that, if untoward effects of dehydrating and desalting therapy were observed soon after the introduction of the mercurial diuretics, they should be more prevalent today, not only because the mercurials are used *more frequently and in larger doses today* but because diets are available with a much lower sodium content now than at any other previous time. We believe that the untoward effects are more prevalent and that their nonrecognition is due to preoccupation with the concept that congestive heart failure can exist only in the presence of excessive sodium retention. This concept was clearly formulated by Dock,[8] who stated, "Death from congestive failure like death from diabetic coma is now preventable. . . . Both (patients with diabetes and congestive heart failure) should be reduced to muscle and bone) with minimal *panniculus*. . . . the symptoms (of congestive heart failure) can be controlled by reducing the blood volume and by maintaining normal body weight by diet and other methods of lowering the sodium available to the body."

Although we do not agree with the ingenious analogy that Dock[8] made between diabetes and congestive heart failure, those who do must admit that drastic restriction of sugar not only does not cure all diabetic persons but may harm many, and that, as Sunderman[9] has shown, dosages of insulin which precipitously drop the blood sugar level may produce the symptoms of insulin shock even though the resulting blood sugar is still above normal.

The concept of the innocuousness of the persistence in a regimen of sodium restriction and sodium diuresis is apparently based on implicit assumptions (1) that the regimen itself is not harmful, (2) that the water and salt mechanisms of the body are not disturbed and (3) that a normal venous pressure and normal blood volume are optimal for persons with heart disease.

The toxic effects of the mercurials have been reviewed by DeGraff and Nadler.[7] McCance[10] has described the toxic effects of salt restriction in normal human beings.

The water and salt mechanisms of the body are disturbed in congestive failure. Merrill[11] has shown that at least in some instances of cardiac failure glomerular filtration is diminished and tubular reabsorption of sodium is increased. It has not been shown whether glomerular filtration is decreased because of a uniform decrease in filtration in each glomerulus or whether there are less glomeruli active at one time. Burch[12] has shown that mercurial diuretics reverse this process of sodium retention and cause a disproportionately greater excretion of sodium. As the time approaches when there is no longer sodium retention, the salt-poor diet exerts a severe strain on tubular cellular function. Newburgh[13] recently reemphasized that a salt-poor diet may require work of the tubular cells that they are incapable of performing. If this occurs, salt leakage continues, drastic dehydration occurs, uremia and the picture of shock may appear. This sequence of events invariably takes place if preexisting renal disease is present. It not uncommonly takes place with presumably preexisting normal renal function if the dehydration regimen is severe. The effects of diminished blood supply produced by dehydration on other organs in the body, particularly the adrenals, have not as yet even been explored. The deranged concentration of blood electrolytes, the autointoxication and the acidosis all further impair cardiac function and may lead to increasing dyspnea that cannot be corrected by more sodium restriction or sodium diuresis. In addition, the venous pressure drops. According to Star-

ling's law, other things being equal venous filling determines cardiac output. This raises the question of what is the optimal venous pressure for persons with cardiac disease. McMichael[14] pointed out that there are some persons with cardiac disease who have dyspnea, increased venous pressure and even edema who are made much worse by attempts to reduce their venous pressure. Cardiac disease secondary to severe anemia and pulmonary disease are two of these types. Anemia is not uncommon in rheumatic persons. Parker and Weiss[15] have shown how common and how severe pulmonary vascular disease may be in persons with rheumatic heart disease. Indeed, an occasional pathologist has been so impressed with how severe pulmonary disease was and how insignificant the cardiac disease was in persons with rheumatic heart disease that failure was regarded as due primarily to the pulmonary disease rather than the heart disease. Perhaps this fact explains why some elderly rheumatic persons with mild but very slowly progressive failure feel worse after the use of a mercurial diuretic. Weiss and Robb[16] also stated that 63 per cent of their patients with cardiac asthma had the anatomic characteristics of pulmonary emphysema. Obviously, if mechanisms for a high output type of failure are partly present in the rheumatic or hypertensive persons, drastic attempts to reduce the venous pressure to normal must lead to harm. This, of course, is especially true for mechanical causes of venous hypertension such as tricuspid stenosis or constrictive pericarditis.

Because there are no simple rules of thumb by which one can distinguish the therapeutic from the harmful effects of this regimen, we strongly urge that careful attention be paid to the symptoms of the patient; these symptoms must be carefully and thoroughly evaluated. Weakness, lassitude, anorexia, nausea, vomiting, restlessness, thirst not relieved by plain water, apathy, mental confusion, fall in blood pressure, increase in pulse rate, diminution in the volume of the pulse, clammy skin, shock and coma are all symptoms or signs which may be present in excessive salt depletion. Any one may be due to other causes, such as excessive sedation, digitalis, unrelated infection, thromboembolic phenomena or natural progression of the cardiac disease.

It is for these reasons that the physician must use all his faculties and help from the laboratory in arriving at the cause of the symptoms and not simply increase the degree of sodium loss.

Finally, we should like to reiterate what was said at the beginning of this paper. This work is not to be regarded as an indictment of the regimen of sodium restriction and sodium diuresis in treatment of congestive heart failure or hypertension. Our purpose is simply to point out that there are limitations to its use and, if these limitations are not recognized, not only will our patients be harmed but many may die.

SUMMARY AND CONCLUSIONS

Seven cases are briefly reported that demonstrate some of the untoward effects, including 4 fatalities, which may occur in cardiac patients subjected to a regimen of sodium restriction and sodium diuresis. The blood urea nitrogen was determined in 7 patients, the blood chlorides in 6 patients and the blood sodium in 1 patient while the phenomena of congestive heart failure were present and while this regimen was still being used.

The blood chloride and the blood sodium were reduced and the blood urea nitrogen was elevated in each instance. Some of the mechanisms which may produce these untoward effects are discussed. The great advance in the therapy of heart disease by the introduction of a regimen of sodium restriction and sodium diuresis is emphasized, but the importance of individualizing this therapy and of being alert to the possibility of the patient's having passed from the therapeutic to the toxic stage of this therapy is particularly stressed.

NOTE.—No salt substitute was used by any of these patients, so that neither lithium nor potassium intoxication had to be considered as possible aggravating factors.

Special Article

PRIMER ON THE RHEUMATIC DISEASES

PREPARED BY A COMMITTEE OF THE AMERICAN RHEUMATISM ASSOCIATION

(Continued from page 1076)

RHEUMATOID ARTHRITIS

ETIOLOGY

Rheumatoid arthritis is a disease of unknown causation. Many theories of causation have been proposed but none has withstood critical evaluation. Some known facts are that it has a slight tendency to be familial; the sex incidence in peripheral rheumatoid arthritis is 3 women to 1 man, and 80 per cent of the cases occur between the ages of 25 to 50, with the peak at 35 to 40. According to a number of current theories, rheumatoid arthritis is variously claimed to be (1) an infectious disease, (2) a metabolic disease, (3) a disease with an endocrinologic basis, (4) a disease of the peripheral circulatory apparatus, (5) a disease of the nervous system, (6) a psychogenic disease and (7) a disease of hypersensitivity. Such a list as this indicates how little actually is known about the cause of rheumatoid arthritis.

PATHOLOGY

Rheumatoid arthritis is invariably described as a systemic disorder. Scudamore, as early as 1827, pointed out that the disease is essentially one of dense white fibrous tissue. More recently it has been suggested that the disease affects primarily the interfibrillar substance of connective tissue. This substance is a colloidal, jelly-like material existing in the interstices between cells and fibers of mesenchymal origin. This concept is consistent with the widespread nature of the lesions in rheumatoid arthritis.

Articular Lesions.—The articular lesions vary greatly with the stage and severity of the disease. Early in the disease there is proliferation of the synovial cells with thickening of the synovial lining. The cartilage loses its normal luster and may show superficial ulcerations. As the disease progresses, the articular cartilage appears grayish white, is softer and may contain larger ulcerations. Proliferating connective tissue is also seen in the subchondral marrow spaces. The cartilage is surrounded by granulation tissue and may be destroyed. Fibrous ankylosis may occur and in time may become bony ankylosis. Late in the disease the bony cortex of the adjoining bones is reduced in thickness and the trabeculae are fewer in number.

Microscopically, in the active phase of the disease the synovial tissue shows proliferation of the lining cells, increased vascularity and varying grades of cellular infiltration which may or may not be perivascular. The majority of the infiltrating cells are lymphocytes. Focal collections of lymphocytes, whether perivascular or not, are seen frequently. Similar cellular infiltrations may be observed in the bone marrow. These changes are not specific, and an absolute diagnosis is often impossible from the microscopic appearance alone.

Subcutaneous Nodules.—The subcutaneous nodules of rheumatoid arthritis constitute the one most characteristic pathologic lesion of the disease. These are similar to the nodules of rheumatic fever, and many observers believe that pathologically the nodules in the two diseases are essentially the same and that such differences as occur are explainable on the basis of the greater age and size of those of rheumatoid arthritis. Exudation of plasma and blood cellular constituents is a prominent feature of rheumatic fever nodules, which contain, in addition, small focal areas resembling Aschoff bodies. In the nodules of rheumatoid arthritis proliferation and degeneration predominate, Aschoff-like nodules are rare and exudation is not a prominent feature. The vascular changes seen in such nodules vary from perivascular infiltration of inflammatory cells to diffuse inflammation and degeneration of the entire wall. Thrombosis is observed more commonly in the nodules of rheumatoid arthritis.

Infiltrations in Skeletal Muscles.—Lymphocytic infiltrations in the skeletal muscles have been described in rheumatoid arthritis. They have also been found in other diseases, however, and cannot be considered pathologically specific. Similar collections of lymphocytes have been described in the sheaths of large peripheral nerves in rheumatoid arthritis.

Extra-Articular Lesions.—Extra-articular lesions have been noted in rare instances in the pleura and pericardium, and adherent pericarditis is occasionally encountered. Signs of cardiac valvulitis are found no more frequently in life in patients with rheumatoid arthritis than in the general population. At autopsy there are conflicting reports as to the incidence of rheumatic-fever-like lesions in the hearts of patients with rheumatoid arthritis, figures varying from 53 per cent to less than 1 per cent.

CLINICAL FEATURES

Onset.—Many authors refer to prodromal symptoms, but, as the onset of the disease is frequently insidious, it is impossible to be sure that these symptoms do not actually constitute a part of the disease itself. In many instances the initial complaints are those of fatigue, exhaustion, lassitude, vasomotor disturbances, muscular stiffness, loss of weight and general debility. Since similar symptoms become more pronounced in later stages of the disease, it is probable that the onset has already occurred by the time these symptoms have appeared.

Seventy five per cent of cases begin insidiously. One or more joints gradually become swollen and painful, and the disease slowly and progressively spreads to involve other articulations. In these cases there may be comparatively little systemic rea[illegible] early stages. In other instances the [illegible] subacute in character. There may be repe[illegible] attacks of polyarthritis accompanied by pain, sw[illegible] and redness of the affected joints, together with constitutional disturbances such as slight fever, tachycardia and mild leukocytosis. The feet may be the first joints involved, with the characteristic changes in the hands appearing only later. The pain of flat feet is relieved by rest, whereas the foot pain of rheumatoid arthritis is severe after inactivity. Finally, in certain proportion of cases the disease begins as acute polyarthritis with high grade fever and leukocytosis, and, in the initial stages, simulates rheumatic fever.

Clinical Features of the Articular Lesions.—In typical cases the articular involvement shows a symmetric distribution. The smaller joints of the hands are particularly prone to be affected, especially the proximal interphalangeal joints of the fingers. For some reason the terminal interphalangeal joints usually escape. In this respect it usually differs from degenerative joint disease. In cases of severe disease practically every joint in the body may become involved.

A typical rheumatoid joint presents a characteristic appearance. As a rule, swelling, pain and limitation of movement are present and the nature of the swelling is rather distinctive. Owing to the thickening of the periarticular tissues and the atrophy of the muscles above and below, the joint presents a spindle-shaped appearance. The adjacent bursae and tendon sheaths are frequently involved, but there is rarely as much increase in synovial fluid within the joint as might be expected, much of the swelling being due to synovial proliferation.

While rheumatoid arthritis may become arrested or quiescent at any stage, it usually proceeds to a chronic condition. The muscles about a joint usually fall into two groups acting as antagonists, of which one is stronger than the other. When the joint becomes inflamed and painful, muscle splinting involuntarily occurs with an element of persistent contraction. The stronger of the groups exerts the greater pull, and, since this is usually the flexors, the result is a flexion contracture. The periarticular swelling gradually subsides, and contractures begin to become of greater importance. The changes are likely to be particularly apparent in the hands, wrists, knees, elbows and toes, but almost every joint in the body may be involved. In cases of advanced disease fibrous and bony ankylosis may occur, accompanied by subluxation or dislocation of the affected joints.

Muscular Weakness and Atrophy.—Muscular weakness and atrophy are prominent in rheumatoid arthritis and in some cases constitute the most striking features. Atrophy usually is particularly noticeable in the muscles of the hands, but it also occurs in all the muscles of the extremities and contributes to the fusiform appearance of the joints. In the opinion of the majority of observers the muscular atrophy is an integral part of the disease and is not solely attributable to the two known factors—disuse and muscular malnutrition—associated with persistent contraction.

Cutaneous Changes.—The skin of the extremities frequently becomes smooth, glossy and atrophic, and there may be redness of the thenar and hypothenar eminences. The hands are usually cold and clammy. Psoriasis occurs in about 3 per cent of cases.

[illegible] *Nodules.*—Characteristic subcutaneous [illegible] in 15 to 20 per cent of cases. The [illegible] often found in the region of the elbows, [illegible] over the ulna just distal to the olecranon, and [illegible] frequently over other bony prominences. They vary in size from scarcely palpable seedlike particles to lesions the size of an olive or larger. They are not painful except when their position exposes them to undue pressure when they become ulcerated and secondarily infected. The nodule is usually located in sites exposed to frequent trauma. In contrast to the nodules of rheumatic fever, which last a matter of weeks or months, the rheumatoid nodules persist for months to years.

Constitutional Extra-Articular Manifestations.—In most cases the temperature is slightly elevated in the early acute stages of the disease. In a few cases elevation of temperature up to 104 F. may continue for weeks. There is usually moderate tachycardia and a decreased peripheral circulation.

The general nutrition may suffer severely in rheumatoid arthritis. In cases of severe disease profound cachexia may develop. Various expressions of abnormal gastrointestinal function are often seen, which are believed to be secondary to the chronic debilitating nature of the disease. Joint changes indistinguishable from rheumatoid arthritis are present in 4 per cent of patients with ulcerative colitis.

Splenic enlargement occurs in 5 to 10 per cent of cases. A generalized glandular enlargement of moderate degree is commonly observed. Pericarditis has been observed in patients with rheumatoid arthritis. Myocarditis and valvular lesions have also been reported, but in these instances the presence of previous or concurrent rheumatic fever must be considered. Iritis and uveitis, often of an intractable nature, may accompany or precede rheumatoid arthritis.

LABORATORY OBSERVATIONS

In rheumatoid arthritis there is usually a hypochromic microcytic anemia of the iron deficiency type which responds little if at all to iron. The white blood cell count, the differential count and the platelets are within normal limits in most patients. The erythrocyte sedimentation rate is almost always rapid, although a few exceptions of active disease with a normal rate may be seen. Group A hemolytic streptococci are agglutinated by the serums of a considerable number of patients with peripheral rheumatoid arthritis. This is a difficult technical procedure and cannot be carried out as a routine laboratory measure. If available, however, it is a valuable aid in diagnosis, as the agglutination is rather specific with few false positive reactions. The antistreptolysin-0 titer is not elevated in rheumatoid arthritis in a greater number of instances than in the general population. The uric acid is usually within normal limits.

ROENTGENOLOGIC OBSERVATIONS

The roentgenologic picture varies so much in different stages of rheumatoid arthritis that it is convenient to describe the early and late stages separately.

Early.—Early cases may show no roentgenologic abnormalities, but gradually characteristic changes occur. In addition to the evidence of intracapsular effusion and of periarticular soft tissue swelling, the most uniform of these is a generalized decalcification. As a result of the superimposed factor of disuse, the decalcification usually appears more prominently in the region of the affected articulations, but all the bones in the body participate in the process. There may be narrowing of joint spaces and spotty marginal resorption of bone. Cortical destruction of the metatarsal heads may appear rather early.

Late.—As the disease progresses, destruction of cartilage with narrowing of the joint space occurs and small areas of cortical erosion appear. These small areas of atrophic bone destruction, often referred to as "punched-out areas," are a prominent feature of rheumatoid arthritis as well as of gout. In advanced cases the articular surfaces may become fused through fibrous or bony ankylosis. Not infrequently there may be subluxations or dislocations, with or without destruction of the ends of the bones. Coincidentally with these changes there may occur some degree of bone production, lipping and osteophytes. These develop relatively late in the disease, however, and are evidences of degenerative joint disease secondary to the rheumatoid arthritis.

DIAGNOSIS

Criteria for diagnosis of rheumatoid arthritis have now been well established, and it is possible to distinguish this disease in most instances from other forms of arthritis. From the clinical picture and the laboratory aids, the typical case offers but little difficulty in diagnosis, and only the early or atypical case will cause trouble.

Differential Diagnosis.—Degenerative Joint Disease: The differentiation between rheumatoid arthritis and degenerative joint disease is important, since numerically these two groups account for approximately two thirds of all cases of chronic arthritis and there is a great difference in their prognosis and treatment. Rheumatoid arthritis is a systemic disease and the patients are sick. Degenerative joint disease, as a manifestation of aging, affects primarily hyaline cartilage, and the patients are otherwise well. Muscular weakness and atrophy and cutaneous changes are commonly associated with rheumatoid arthritis, rarely with degenerative joint disease. Weight-bearing joints are oftener involved in degenerative joint disease, while in rheumatoid arthritis the involvement is usually symmetric and generalized. The proximal interphalangeal joints are involved in rheumatoid arthritis, the terminal most often in degenerative joint disease (Heberden's nodes), although occasionally the proximal joints are involved also. Subcutaneous nodules are not seen in degenerative joint disease. The agglutination with group A hemolytic streptococci is not positive in degenerative joint disease and the erythrocyte sedimentation rate is elevated only slightly if at all unless for some other reason. By roentgen ray, osteoporosis and ankylosis are not seen with degenerative joint disease.

Gonococcic Arthritis: Gonococcic arthritis may be clinically confused with rheumatoid arthritis, especially if more than one joint is involved and if a recent attack of gonorrheal urethritis is concealed or not recognized by the patient. The true nature of the disease should, however, soon become apparent.

Rheumatic Fever: Typical rheumatic fever does not present any problem in diagnosis, but there is a chronic type of rheumatic polyarthritis very similar to that of rheumatoid arthritis (see section on rheumatic fever).

Gout: Acute gout should not be confused with rheumatoid arthritis, but chronic gout may readily be mistaken for it. In acute gout a therapeutic response to colchicine is diagnostic. In chronic gout tophi, an elevated serum uric acid level and roentgen changes serve to differentiate the two. Punched-out areas in bone are found in both rheumatoid arthritis and chronic gout.

Lymphogranuloma Venereum: A multiple arthritis may be associated with lymphogranuloma venereum.

Tuberculous Arthritis: Tuberculous arthritis is usually monarticular, and after a few months roentgen rays will help to differentiate the two. Culture and injection of the joint exudate into guinea pigs are of value if positive, but biopsy of the synovium may be needed.

Variants of Rheumatoid Arthritis.—The following four syndromes, while called by other names, cannot be clearly separated from rheumatoid arthritis. Until their exact causation is discovered they will probably be classified by most observers under the general heading of rheumatoid arthritis, although it is recommended that their other designations be shown also:

Still's Disease: Still's disease is a term applied to what probably is juvenile rheumatoid arthritis. The joints have the same appearance as in rheumatoid arthritis and there may be typical subcutaneous nodules, but as a rule the result of the streptococcus agglutination test is negative. A number of cases have been observed over a period of years and on into adulthood. At that time the entire clinical picture cannot be distinguished from rheumatoid arthritis.

Felty's Syndrome: The name Felty's syndrome has been applied to cases of rheumatoid arthritis in which the liver and spleen are enlarged and leukopenia is present. A high percentage of these patients have positive hemolytic streptococcus agglutination reactions, and they may show typical subcutaneous nodules.

Psoriatic Arthritis: Psoriasis occurs in about 3 per cent of patients with typical rheumatoid arthritis. This probably indicates merely a tendency for these two diseases to coexist. However, there are other cases of psoriasis in which there are arthritic changes only in terminal phalanges of fingers, which show overlying psoriatic lesions of skin and nails. These cases may represent a distinct form of arthritis, but at present the question remains open.

Rheumatoid Spondylitis: This syndrome, which is known also as ankylosing spondylitis, Marie-Strümpell arthritis, von Bechterew arthritis, spondylitis ankylopoietica and spondylitis rhizomelique, is regarded by many as rheumatoid arthritis of the spine, though the relationship is not clear, and this may be a separate entity. The fact that 20 per cent of these patients have changes in peripheral joints indistinguishable from those seen in classical rheumatoid arthritis suggests that this syndrome is merely a special form of the latter disease. However, there are also dissimilar features. The sex incidence is nine or more males to one female, which is in sharp contrast to typical rheumatoid arthritis. The response to certain therapeutic measures is different also, for these patients do not respond to chrysotherapy but do receive considerable benefit from roentgen therapy. In addition the result of the hemolytic streptococcus agglutination test is almost always negative in patients with spondylitis. The roentgen picture is characterized by narrowing and poor definition of the articular margins of the sacroiliac joints, of the lateral articulations (apophysial joints) of the spine and of the costovertebral joints. Later demineralization of the vertebral bodies and calcification of the lateral spinal ligaments give the characteristic roentgen picture of the bamboo spine, but this is a fairly late finding.

PROGNOSIS

In spite of the vast amount of crippling and deformity to which rheumatoid arthritis leads, the prognosis is by no means as unfavorable as is generally supposed. It is not sufficiently appreciated that a certain proportion of patients recover more or less completely. More frequently, the process becomes arrested or quiescent at some stage in its course and the patient is able to carry on activities with only a small amount of difficulty. In a smaller proportion of cases the disease pursues a cruel and inexorable course, leaving the patient severely crippled.

It is impossible to forecast the turn of events in an individual patient. In the most favorable case a severe relapse may occur at any time, while, on the other hand, the most malignant example of the disease may suddenly become arrested.

Few accurate statistics on the natural course of the disease are available, but in a recent series over a five to ten year period, 15 per cent were found to be in remission, 38 per cent were improved, 13 per cent were unchanged and 34 per cent were worse. Of the patients who had had the disease for more than one year, only 5 per cent were in remission and 50 per cent were stationary or worse. In this same report severe extensive disease was the most important single sign of a poor prognosis. Of no importance in the ultimate prognosis were such things as prodromal symptoms, acuteness of onset and the presence of anemia.

TREATMENT OF RHEUMATOID ARTHRITIS

Although at present there is no specific cure, it is often possible to control the disease or improve its clinical course. Rheumatoid arthritis is a systemic disease; the patient must be treated as a whole rather than with local therapy to the joints alone. Certain factors must be borne in mind in evaluating results of therapy: (*a*) the disease is subject to spontaneous relapses and remissions, and (*b*) certain patients recover fairly quickly, and the last therapy used is apt to be given the credit. Critical appraisal of any therapeutic agent in this disease requires several years of observation.

Realizing the difficulty of evaluating therapeutic claims, one should not be dogmatic in assessing the value of any single measure. In general, however, the therapeutic agents used in rheumatoid arthritis may be divided into three groups: (1) measures of proved value, (2) measures on which there is fairly uniform agreement but not complete unanimity and (3) measures which are of doubtful value or useless.

Measures of Proved Value.—These, for the most part, are directed toward improving the patient's general health.

(*a*) Rest: Rest is probably the most important single measure in the treatment of this disease—rest for the body as a whole and rest for the inflamed joints in particular. However, in prescribing rest, intelligence and insight are necessary. The amount of rest varies from confinement in a hospital for six weeks to one year for the patient with severe disease to breaking the day with a two hour rest period when the disease is mild. Rest must be regulated carefully. It is never necessary to prescribe absolute bed rest. Even in the case of most severe disease, mild muscle setting exercises should be prescribed and should be increased as the patient improves. Each case must be considered on its own merits. For local rest, suitable splints of the "gutter" type are of great assistance.

(*b*) Nutrition and General Hygiene: The majority of patients are underweight, undernourished and chronically ill. Every effort should therefore be made to maintain their nutrition in the best possible state. A well balanced diet of nourishing food is essential. All measures for improving the patient's general health should be encouraged. These include correct bowel function, dental care and removal of obvious foci of infection. No one now believes that the removal of an infected focus will alter the course of rheumatoid arthritis, and extraction of teeth, tonsils, gallbladders and pelvic organs is to be condemned unless they are so diseased that they should be removed for their own sakes. Indeed, wholesale removal of teeth usually is not only useless but actually harmful to the patient through interference with nutrition.

(*c*) Drugs: Salicylates constitute the one group of drugs which are of symptomatic value for the relief of pain. Occasionally it is necessary to resort to other drugs, such as barbiturates, for rest and sleep, and small amounts of codeine for brief periods of time. Morphine and meperidine hydrochloride (demerol®) should be avoided, as they should in any chronic, painful disease.

(*d*) Prevention and Correction of Deformities: In no disorder of the joints is the prevention of deformities of greater moment. The deformities are too often due to neglect and, to a great extent, can be prevented by skilful use of splints. For the prevention and correction of hand deformities light aluminum splints are usually used, but for other joints deep "gutter" splints of plaster are preferable. These are worn only part of each day and at night in most cases, although for the correction of existing contractures continuous use is sometimes advisable for short periods. In rheumatoid spondylitis, a suitable brace during the day and a plaster shell to sleep in may prevent the spine from becoming rigid in a faulty position. In general, when stiffness and pain are severe, weight bearing should be restricted. When weight bearing is allowed, shoes which give some support should be prescribed and worn consistently, and loose slippers are to be avoided. When flexion contractures have occurred, active and passive exercises in conjunction with repeated plaster casts made in increasing extension may help to correct the contracture. If ankylosis is to be the end result, it is of the utmost importance that the affected joint become ankylosed in the optimal position for use. The knee should be extended to 180 degrees; the hip in straight position; the wrist in middorsal flexion half way between pronation and supination, and the elbow flexed at about 90 degrees. When deformities due to ankylosis have occurred, surgical measures may be of great value. Such surgical procedures should be done when the activity of the disease has subsided.

(*e*) Physical and Occupational Therapy: Physical therapy and spa therapy are useful for many types of arthritis. Baths and exercises in warm pools are sometimes helpful. Heat in the form of poultices, melted paraffin baths, baking lamp or diathermy is often comforting but is not curative. In fact, in the case of acute disease local heat sometimes is not well tolerated. The most useful forms are simple measures such as the application of heat and muscle exercises which can be performed at home daily by the patient after a minimum of instruction. Violent massage and strenuous passive exercises are poorly tolerated, and all such therapy should be confined within limits of pain and fatigue. Occupational therapy can be of great assistance in awakening the patient's interest in exercising important groups of muscles.

(*f*) Psychotherapy: The importance of psychic factors in this disease is great but has not been clearly defined. It is clear, however, that the attitude of the physician to the patient is most important. Encouragement to the patient and an optimistic interest in his illness will often help him to carry out his routine, whereas the reverse attitude will permit the patient simply to sit and allow deformities to develop.

(*g*) Rehabilitation: The training of crippled patients to make the greatest use of their limited capacities is important in the severely disabled.

Measures on Which There Is Fairly Uniform Agreement but Not Complete Unanimity.—(*a*) Chrysotherapy in Rheumatoid Arthritis of Peripheral Joints: Gold compounds have been used widely in Europe for the last fifteen years and in this country for ten years. There is now fairly uniform agreement—but with some very competent dissenters—that gold is the one agent which has been shown to change the course of rheumatoid arthritis in a significant number of patients. The mechanism of its action is not understood. However, even the most enthusiastic proponents of gold recognize its limitations, which are these: 1. Gold is a toxic drug. Severe toxic reactions occur in from 10 to 20 per cent of patients. Fatalities occurred when gold was first used but, with the precautions now observed, deaths from gold are extremely rare at present. 2. Gold does not benefit a considerable number of patients with rheumatoid arthritis. 3. The beneficial effects of gold are temporary and relapses may occur after its use has been stopped.

Toxic reactions ascribed to gold in the past included practically every system in the body, but it is now generally agreed that these reactions fall into four categories: (1) cutaneous: varying from mild pruritus to fatal exfoliative dermatitis; (2) hemopoietic: with depression of one or more elements, agranulocytosis, thrombopenia or even aplastic anemia; (3) renal: varying from mild albuminuria to full blown heavy metal type of nephrosis, and (4) mucous membrane: stomatitis, gastritis, colitis.

There continues to be considerable discussion as to whether or not gold is a hepatic poison. Most cases of acute yellow atrophy or of the milder infectious hepatitis following use of gold compounds may also be due to a homologous serum jaundice either from contaminated needles or from a transfusion given concurrently with gold. However, some authorities maintain that gold is a hepatic poison, and evidence of hepatic damage should be searched for when a patient is receiving gold.

Toxic reactions may be prevented to a limited extent by care on the part of the physician. With the use of smaller doses (never above 50 mg. of the compound at a time) the incidence of renal and mucous membrane complications has decreased markedly. Urinalyses every week or two during the course of treatment with gold may help to avoid a serious reaction. When albuminuria appears, use of gold should be stopped. Fewer blood dyscrasias have been seen following the use of the smaller doses as well, but these still occur. White blood cell counts with differential counts and estimation of the number of platelets on the smear should be done every week or two in order to detect the earliest evidence of a toxic reaction. These reactions, however, may appear suddenly, and it is impossible to predict them. Manifestations of skin toxicity are usually preceded by pruritus, but they, too, may appear without warning. Any rash appearing during the course of gold therapy should be considered a toxic reaction to gold. At the first sign of leukopenia, thrombopenia with or without purpura, or pruritus, gold should be stopped. However, simply stopping the administration of gold is often of little value, since the gold injected remains in the tissues for long periods and even ten months after the last injection gold may be detected in the urine. Recent preliminary reports on the use of 2,3-dimercaptopropanol (BAL) in the treatment of gold toxicity have been encouraging and if confirmed, more effective therapy of the complications of chrysotherapy may be available. If a severe toxic reaction develops, gold should usually not be administered again.

Because almost all patients who have been benefited by gold relapse after the gold is stopped, the original method of treatment has been supplemented in almost all clinics by that of maintenance dosage whereby gold is continued indefinitely at intervals of two to four weeks. The efficacy of this method in preventing relapses has not yet been established. For detailed schedules of treatment, the reader is referred to articles on this subject, since no physicain should use this form of therapy who has not made a more thorough study of it than could be presented in this Primer.

(*b*) Transfusions: Hypochromic (secondary) anemia, refractory to the administration of iron, is common in this disease, and two or three transfusions of 500 cc. of whole blood at fortnightly intervals may be of distinct value. Some observers believe that in rheumatoid arthritis transfusions exert a beneficial effect in addition to the antianemic effect.

(*c*) Roentgen Therapy in Rheumatoid (Marie-Strümpell) Spondylitis: There is general agreement that chrysotherapy does not benefit rheumatoid spondylitis. Roentgen therapy, on the other hand, is of considerable value in rheumatoid spondylitis but not in rheumatoid arthritis of peripheral joints. Roentgen therapy, when combined with general care, proper exercises and the preservation of an erect posture, by braces if necessary, will cause a symptomatic remission in over 80 per cent of patients with rheumatoid spondylitis. This is characterized by decrease in pain and stiffness and increase in mobility of the spine. It is of interest that although the patients have relatively few subjective symptoms of pain and stiffness, roentgenologic changes and increasing rigidity of the spine continue to progress.

(*d*) Climate: Well controlled studies have not been made on the incidence of rheumatoid arthritis in various parts of the United States or on the effects of climate on the disease once established. One can say, however, that, other factors being equal, it seems wise for patients with rheumatoid arthritis to avoid the northern winters when economic and other factors do not make such a move a greater hardship.

Measures Which are of Doubtful Value or Useless.—The following belong in this category and cannot be recommended: (*a*) vaccine therapy, (*b*) foreign protein therapy, (*c*) vitamins in massive doses, (*d*) drugs as specifics, (*e*) endocrine preparations, (*f*) dietary fads, (*g*) fever therapy, (*h*) sulfur, (*i*) bee venom therapy, (*j*) sulfonamide derivatives, (*k*) penicillin and (*l*) antireticulocytotoxic serum.

The value of vaccine therapy remains unproved. The value of foreign protein injections in the form of milk, typhoid vaccine and the like has not been definitely proved. Fever therapy is followed by only temporary improvement. These are rigorous procedures, and few patients with rheumatoid arthritis can tolerate them. At the present time therapy with large doses of vitamin D should be regarded as of doubtful value with definite potentialities for harm. There are no specific drugs. Optimistic reports with endocrine preparations, dietary fads and colloidal sulfur have not been substantiated. Injections of bee venom are of no value. Sulfonamide compounds and penicillin have been useless. Bogomolets' antireticulocytotoxic serum has proved valueless in rheumatoid arthritis.

DEGENERATIVE JOINT DISEASE

This common articular disorder has been variously named osteoarthritis, hypertrophic arthritis, senescent arthritis and, by certain European writers, arthritis deformans.

PATHOGENESIS AND CAUSATION

Pathogenesis.—The earliest pathologic signs of this form of rheumatism are invariably small pits and irregularities of the articular surfaces. These are defects in the hyaline cement substance of cartilage which permit the structural fibrils of the normally homogeneous matrix to become apparent (fibrillation). Subsequently, the ulcerations extend toward the borders of the cartilage and more deeply into it. The cartilaginous surface may show wide erosions and splits, which penetrate to the epiphysial bone. Cell clusters, and occasionally macroscopic fragments of cartilage, are separated and dislodged into the articular space. Several reactive phenomena can be observed in other components of the joint secondary to this process. Even with early lesions there is active growth of primitive cells at the periphery where cartilage and synovial intima blend into a zone of transitional tissue. Metaplasia to cartilage and bone frequently occurs at this site. Marginal proliferations may also arise at the juncture of periosteum and fibrous synovial capsule, and from subchondral bone. In any case, this development of so-called bony spurs, lipping or osteophytes represents a fairly advanced phase of degenerative joint disease. As the breakdown of cartilaginous matrix begins, the calcified lamella separating cartilage from subchondral bone tends to become thicker and denser, and may even be reduplicated. In examples of severe destruction of cartilage the epiphysial marrow sometimes shows signs of irritation in increased vascularity and growth of endosteal cells and marrow fibrocytes. This granulation tissue may break through the calcified lamella to invade foci of degeneration in the cartilage. Detritus cysts are not infrequently encountered and may give rise to translucent defects in the subchondral area on roentgen examination. The ultimate stage of the disease is characterized by complete loss of hyaline cartilage from the articular surfaces and its replacement with sclerosed, eburnated bone. True ankyloses do not occur, although calcification and osseous bridges are found in some joints the coverings of which are made up in part or altogether of fibrocartilage (for example, the sacroiliac and acromioclavicular joints), and in interspinous ligaments leading to variable degrees of rigidity of the vertebral column. Alterations in the synovial membrane are not striking and consist mainly of increased density of subintimal tissue.

Causation.—The causation of degenerative joint disease is unknown. It is noteworthy that evidence of inflammation in synovial tissue is rare even in the most severe and final stages of the disease, and, when present, indicates a mild and chronic process. Focal infection is not a causative factor. Vascular disturbances, arteriosclerosis and urate deposits have not been encountered oftener than might be expected in an unselected group of persons of the same ages. The positive results, on the other hand, gained from anatomic review of sizable postmortem material, indicate clearly that the primary change is one of degeneration and that this is correlated with both advancing age and functional stresses such as weight bearing. It may be considered proved that the incidence, degree and distribution of degenerative articular lesions vary directly with these factors. Deterioration of cartilage in the weight-bearing areas, for instance of the knee joint, may be demonstrated in some persons toward the end of the second decade of life. It occurs with great frequency and in many joints between the ages of 20 and 40, and is present in 80 to 90 per cent of persons past 60 years of age. Increased wear and tear through excessive and abnormal use of a joint is known to accelerate and enhance the tendency to degenerative changes. As examples of such contributory factors, one may cite occupational stresses, obesity, malposture and habit spasm. Wear and tear is also increased by functional derangements, such as genu valgum, and other mechanical defects within a joint. Damage as the result of previous trauma or an attack of some other form of arthritis may cause degenerative changes to develop sooner. Although pathologic reviews have proved the distribution of histologic changes to be nearly equal in the two sexes, clinical manifestations are seen more often in females than in males. Statistical studies have established a higher incidence of Heberden's nodes in women and the presence in some families of a sex-linked hereditary predisposition for this classical feature of degenerative joint disease. These observations suggest that factors other than the aging process and attrition influence the development and course of degenerative joint disease.

CLINICAL FEATURES

The earliest symptoms usually are insidious mild stiffness and aching pain in or about the affected joint. Fever, leukocytosis, malaise, loss of weight, cachexia or other constitutional manifestations are lacking. Physical signs are inconspicuous at first, but even though there may be no visible changes, passive or active motion, especially in the extremes of range, may reproduce pain. Palpation of the joint during motion may elicit crepitus. Tenderness may be noted at the articular margins. As the disease progresses there is gradual firm or hard, irregular enlargement of the affected joints, although there also may occasionally be slight thickening of the soft tissues. Tenderness will then commonly be found over the periosteal-synovial junction and there may be spasm and tenderness of the associated muscles. Rarely, and in cases of severe disease, one may feel a moderate degree of local edema and increased warmth especially after excessive use of the joint. In the terminal interphalangeal articulations of the fingers the onset may occasionally occur in the form of a fairly sudden, tender, fluctuant swelling, often mistaken for an infection. Generally, articulations which are subject to greater strain, such as the knee and hip joints and the lower spinal articulations, become involved first and to a greater degree. For unknown reasons, the elbows, wrists and ankles are much less frequently affected. Degenerative joint disease is seen much oftener in the terminal than in the proximal interphalangeal joints. While, therefore, one may anticipate certain sites of predilection, the localization of the disease affords no absolute diagnostic criterion, since cartilage in any joint and throughout the body is subject to the same deteriorative process.

Whereas pathologic evidence of degenerative joint disease can be found in young adults and, to be sure, at any age without noteworthy symptoms, clinical manifestations usually do not occur in significant numbers of patients until the latter part of the fourth and the beginning of the fifth decade of life. Again, in contrast to the steadily progressive anatomic changes which have been demonstrated in 80 to 90 per cent of persons above 60, the frequency of symptomatic illness from this process is not of the same order in this age group.

LABORATORY AND ROENTGENOLOGIC OBSERVATIONS

These furnish no definite clue, in that degenerative joint disease does not cause abnormal blood counts, erythrocyte sedimentation rates or basal metabolic rates or characteristic immunilogic serum reactions or deviations in blood chemistry values. Contrary to widespread concept, normal roentgenograms do not exclude the diagnosis, since the familiar roentgen stigmas, such as subchondral condensation of bone, narrowing of the articular space and irregular new growths (osteophytes, spurs, lipping) at the articular margins, are secondary events and occur after the degeneration of cartilage has begun. Discrete subchondral rarifactions may be seen and erroneously interpreted as evidence of gouty arthritis.

DIAGNOSIS

During the early stage of the arthropathy positive identification is rarely possible. Intermittently progressive articular aching relieved on rest, with minimal physical signs of joint disease in a middle-aged person without evidence of general illness, should lead one to consider this diagnosis. The appearance of advanced degenerative joint disease, however, is distinctive, especially when it affects the smaller finger joints with firm

GRANULOMA OF THE SKIN AT SITE OF INJURY BY A FLUORESCENT BULB

WALTER A. COAKLEY, M.D.
RAYMOND N. SHAPIRO, M.D., D.D.S.
and
GEORGE W. ROBERTSON, M.D.
Brooklyn

In recent years the inhalation of the beryllium dusts has become a well recognized industrial hazard.[1] Van Ordstrand[2] and others have described acute pulmonary lesions and Hardy and Tabershaw[3] have described chronic pulmonary lesions associated with the industrial uses of this metal.

Four types of cutaneous lesions have been reported as resulting from exposure to beryllium salts:

1. Gelman, Van Ordstrand and others described a contact dermatitis after exposure to dust and fumes of beryllium sulfate, fluoride and oxyfluoride.

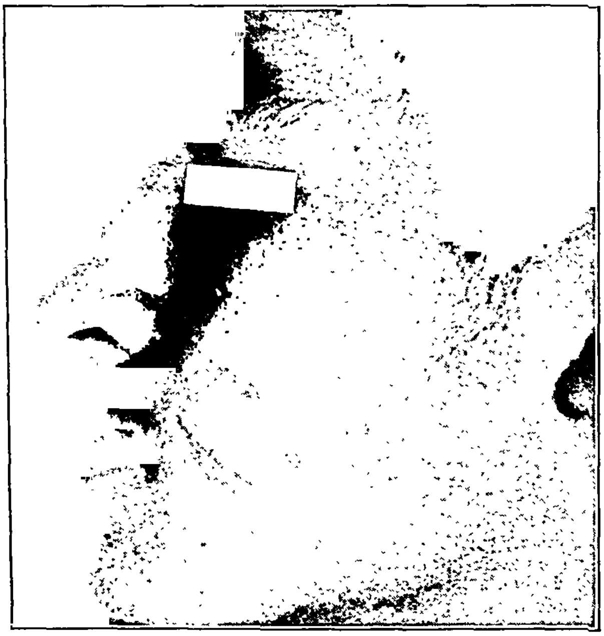

Fig. 1.—Preoperative appearance of scars.

2. Gelman and Van Ordstrand also reported ulcers which result from the implantation of crystals of beryllium sulfate in a laceration. These lesions do not heal unless the crystal of beryllium salt is removed.

3. Hardy and Tabershaw,[3] and Pyre and Oatway[4] have described cutaneous lesions which developed in patients with pulmonary granulomatosis. These lesions appeared from six months to five and one-half years after cessation of work with beryllium phosphors and showed a histologic picture "characteristic of sarcoid." The lesions are believed to be part of a generalized disease.

4. Grier, Nash and Freiman[5] reported 3 cases of subcutaneous granuloma occurring in persons who had cut themselves on fluorescent lamps. The histologic description of these granulomas was very like that of sarcoidosis of the skin. Zinc manganese beryllium silicate was the phosphor with which the inside of these lamps was covered.

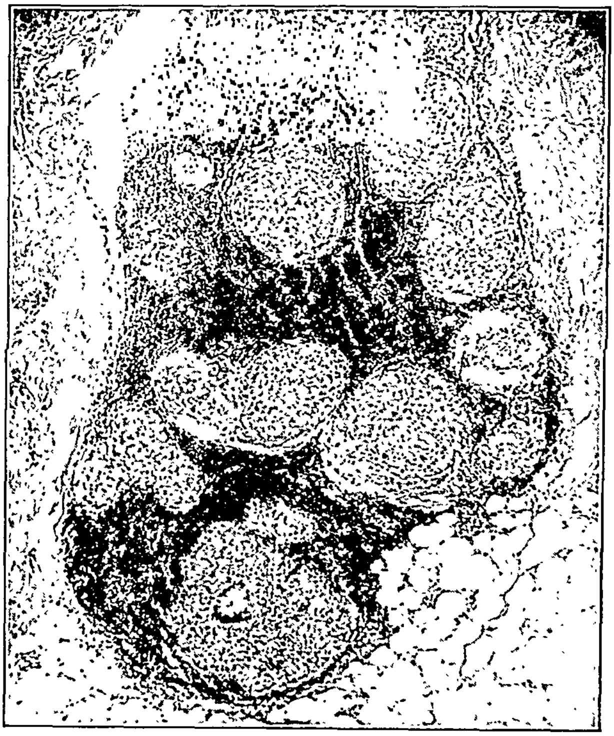

Fig. 2.—Photomicrograph showing sarcoid-like lesions.

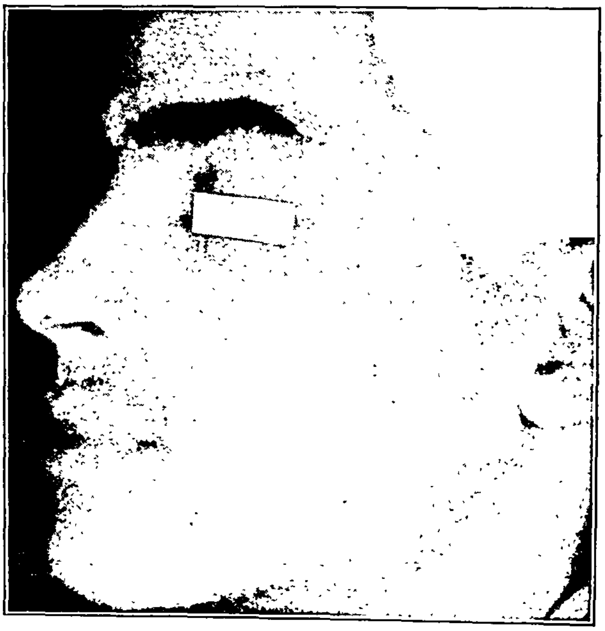

Fig. 3.—Appearance of the face nine months postoperatively.

Grier, Nash and Freiman[5] pointed out that the development of subcutaneous granulomas from local deposition of fluorescent powders raises a hazard in the disposal of burned out lamp

or hard, knobby enlargement leading eventually to gnarled deformities and a somewhat limited range of motion. Mention must be made of the frequency with which degenerative lesions in the articulations of the spine produce symptoms in remote areas, often without giving rise to local complaints. The phenomenon of referred sensations from the thoracic and lumbosacral segments to the trunk and lower extremities is generally recognized. It should also be appreciated that neuralgias localized to the occipital, frontal, retrobulbar or other areas of the head may have their origin in foci of cervical spondylosis. Careful palpation of the spinous processes and lateral spinal articulations, search for muscle spasm and the elicitation of pain in any of the three principal modes of motion of the spine may furnish the clue to this. Immediate though temporary amelioration of referred complaints after manual traction is sufficiently common to render this simple maneuver a useful diagnostic aid when roentgen rays fail to reveal any significant disease.

Degenerative joint disease can as a rule be readily distinguished from inflammatory and infectious arthritides by the lack of constitutional manifestations and by the absence of synovitis. There is usually no significant muscle atrophy, except in cases of advanced malum coxae senilis. In distinction to the various types of arthritis, the course of this disorder is slowly and steadily progressive over years and decades and not punctuated by fulminating attacks. However, more or less acute episodes may occur when the degenerative process has been accelerated and as the result of unusual or even trivial strains on devitalized cartilage.

As has been said, degenerative joint disease and rheumatoid arthritis are dissimilar and should not be confused. Sometimes, when degenerative joint disease involves not only the terminal interphalangeal joints of the fingers (Heberden's nodes) but also the proximal ones, the deformity of the latter may simulate somewhat the fusiform swelling of these joints in rheumatoid arthritis. The hard, knobby character of the enlargement in degenerative joint disease, however, makes the nature of the process clear.

TREATMENT

No specific therapy is known. Therefore this form of rheumatism must be managed by the control of symptoms and the relief of strains on the affected articulations. Except for degenerative hip disease (malum coxae senilis), which often ends in severe disability, and except for a small number of patients with an apparently marked constitutional predisposition, clinical results with this approach will be gratifying.

Reassurance.—It is essential to give the patient, who frequently harbors grave fears of becoming a hopeless cripple, the proper perspective of his fundamentally benign disorder, and it is neither wise nor correct to state or imply that nothing can be done for him and that he need not return. In some patients, coexistent neurotic conflicts and the attendant muscle tension appear to aggravate disability from degenerative joint disease. In such cases the resolution of emotional problems and the attainment of relaxation may produce striking benefit.

Rest.—The most rational therapeutic measures are those providing rest for the affected part. The means to insure this should be applied to the individual joint with a view to its peculiar stresses in weight bearing and motion. In the case of a peripheral articulation of the upper extremity, simple splinting is usually sufficient. In joints of the lower part of the spine, legs and feet, additional measures to relieve strain and weight bearing may be necessary. Support to various parts may be provided by strapping, belts, braces or by the use of canes or crutches. For more severe degenerative disease of the hips and lower part of the spine rest in recumbency with or without traction may be required.

Physical Therapy.—Physiatric measures are valuable in the correction of malpostures which act as contributory factors and in the treatment of degenerative joint disease. During especially painful phases such measures should be confined to applications of heat in a simple form, preferably hot soaks, hot towel packs or infra-red light, accompanied by stroking massage of the periarticular tissues and muscles. After a few days, when the lesion has become quiescent, passive motion should be added before a gradual return to active exercises and normal function. Roentgen therapy has been advocated for the relief of pain, but its benefit is unproved and its use for this purpose in degenerative joint disease unjustified when satisfactory relief can be obtained by safer means.

Diet.—The food intake should follow a normal pattern unless caloric restrictions are advisable. Since obesity is a common aggravating circumstance, weight reduction is frequently indicated to relieve abnormal strains on the joints of the lower part of the spine and the legs.

Drugs.—Relief from pain and muscle spasm in this disease is usually afforded by the salicylates, for instance acetylsalicylic acid in doses of 0.3 to 0.6 Gm. (grains 5 to 10) four to six times daily. The simultaneous administration of a mild sedative such as phenobarbital 0.008 Gm. (grains ⅛) may be helpful in patients with significant nervous tension. If the patient suffers from a deficiency of gonadal hormone, substitution therapy is reasonable, although the specific value of estrogens and androgens in human degenerative joint disease has not been proved. Other glandular elements or vitamins should also be given only on a demonstration of their specific lack. No rationale exists for the use of colchicine, cinchophen, iodides, vaccines, sulfur, gold salts, antibiotics or vitamins in massive dosage.

Surgery.—While the procedures outlined may ordinarily be relied on to control disability from degenerative joint disease and the successful handling of this disorder lies within the therapeutic scope of the general practitioner, the services of an orthopedic specialist will at times be required. Considerable benefits may, in some instances, be obtained from surgical procedures correcting a primary mechanical dysfunction or stabilizing severely damaged articulations. Arthroplasties on the hip joint, especially cup arthroplasties, have in many instances of advanced malum coxae senilis led to an increase in range and diminution of pain. It is pertinent to recall here that following surgical procedures, except those planned for stabilization, a careful program of physical therapy with special emphasis on passive motion should be instituted immediately.

Clinical Notes, Suggestions and New Instruments

GRANULOMA OF THE SKIN AT SITE OF INJURY BY A FLUORESCENT BULB

WALTER A. COAKLEY, M.D.
RAYMOND N. SHAPIRO, M.D., D.D.S.
and
GEORGE W. ROBERTSON, M.D.
Brooklyn

In recent years the inhalation of the beryllium dusts has become a well recognized industrial hazard.[1] Van Ordstrand[2] and others have described acute pulmonary lesions and Hardy and Tabershaw[3] have described chronic pulmonary lesions associated with the industrial uses of this metal.

Four types of cutaneous lesions have been reported as resulting from exposure to beryllium salts:

1. Gelman, Van Ordstrand and others described a contact dermatitis after exposure to dust and fumes of beryllium sulfate, fluoride and oxyfluoride.

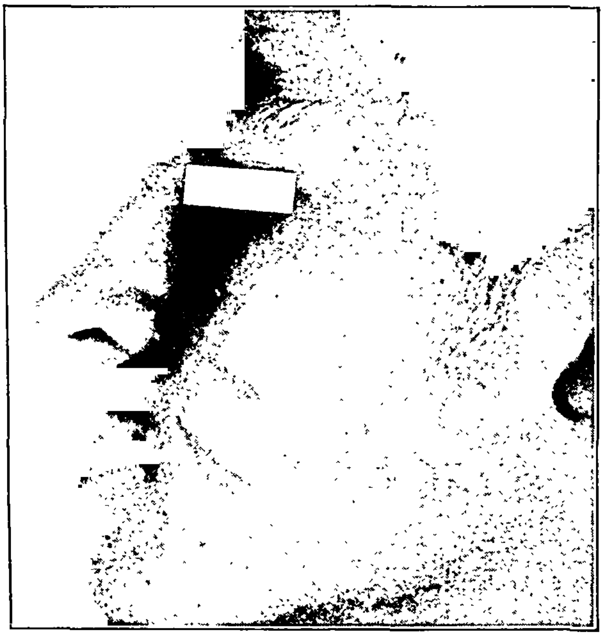

Fig. 1.—Preoperative appearance of scars.

2. Gelman and Van Ordstrand also reported ulcers which result from the implantation of crystals of beryllium sulfate in a laceration. These lesions do not heal unless the crystal of beryllium salt is removed.

3. Hardy and Tabershaw,[3] and Pyre and Oatway[4] have described cutaneous lesions which developed in patients with pulmonary granulomatosis. These lesions appeared from six months to five and one-half years after cessation of work with beryllium phosphors and showed a histologic picture "characteristic of sarcoid." The lesions are believed to be part of a generalized disease.

4. Grier, Nash and Freiman[5] reported 3 cases of subcutaneous granuloma occurring in persons who had cut themselves on fluorescent lamps. The histologic description of these granulomas was very like that of sarcoidosis of the skin. Zinc manganese beryllium silicate was the phosphor with which the inside of these lamps was covered.

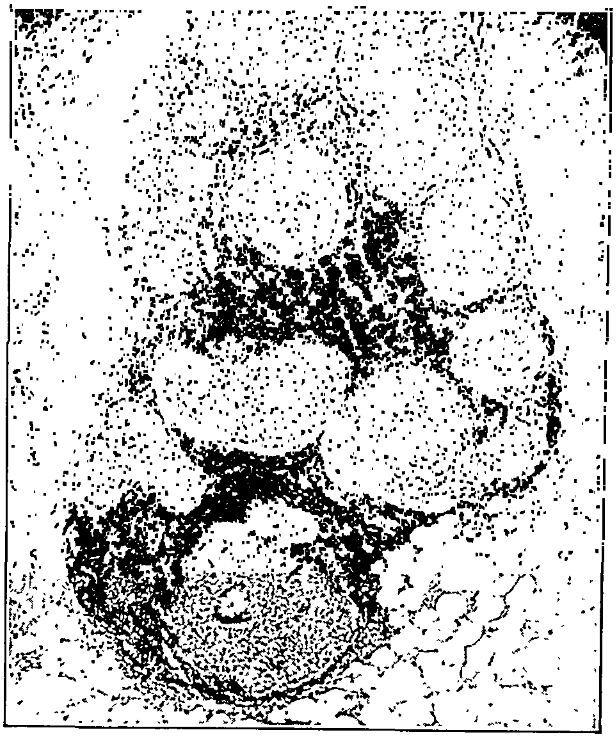

Fig. 2.—Photomicrograph showing sarcoid-like lesions.

tubes with respect to the general public. Fluorescent lighting is widely used today in homes and in places of employment, but few persons are aware that some caution should be used in the handling and disposal of fluorescent lamp tubes. The following case report brings out the danger of careless disposition of burned out fluorescent bulbs. The potentiality of injuries with fluorescent bulbs is called to the attention of practicing physicians.

REPORT OF A CASE

R. S., a 16 year old Puerto Rican boy, was admitted to the plastic surgery service of Kings County Hospital on Dec. 4, 1947. Two years before admission, while playing with burned out fluorescent bulbs, he broke one and was cut on his left cheek, in two places. The wounds were fine lacerations, approximately 1 inch (2.5 cm.) in length, horizontal and parallel in position, just below the level of the zygoma and ½ inch (1 cm.) apart. Although both wounds were superficial, the upper wound was sutured because of excessive bleeding. After several days, the sutures were removed and the wounds appeared to be healed. As time went on, a painful nodule appeared in the lower scar, and there was an intermittent discharge from this scar of "pieces of white meat." Because of the pain and discharge, one year after injury, the patient received radiation therapy to the scars. The amount of radiation is not known, but treatments were given once a month for four months, without causing any improvement.

A review of past history revealed that on April 6, 1942, the patient was brought to the outpatient department of Kings County Hospital for routine examination. At that time he was a normal 10 year old child. A roentgenogram of the chest revealed minimal prominence of both hilar regions and numerous small calcifications scattered throughout both hilar regions, especially the right, in the region of the right lower lung field. This was interpreted as being compatible with a healed tubercular process. The patient was not seen again at this hospital until admission for his present complaint. The remainder of the patient's history was noncontributory.

Physical examination on admission revealed no abnormality other than the two scars on the left cheek. The scars were about 1 inch long, flat, firm, crescentic and red, but nontender. There was no regional lymphadenopathy; the temperature was 98.6 F., pulse rate 72 and respiratory rate 18.

Laboratory Data.—The red blood cell count was 4,500,000 per cubic millimeter, hemoglobin 13.9 gm. per hundred cubic centimeters and white blood cell count 7,200 per cubic millimeter, with a normal differential count. Studies of the chemical content of the blood revealed: serum potassium 22 mg. and serum calcium 10.6 mg. per hundred cubic centimeters; serum alkaline phosphatase 7.5 units, and serum globulin 2.2 Gm., serum albumin 4.5 Gm., total protein 6.7 Gm. and total cholesterol 182 mg. per hundred cubic centimeters. The reaction to the tuberculin skin test was negative in a dilution of 1:10,000.

Roentgenologic Studies.—A roentgenogram of the face revealed no evidence of any opaque foreign bodies in the soft tissues of the face.

A roentgenogram of the chest revealed no evidence of mediastinal or hilar adenopathy. Both lung fields appeared clear, and there was no evidence of Boeck's sarcoid or tuberculosis.

On Dec. 5, 1947, the lesions were excised with local anesthesia and the wounds were closed with buried and cutaneous sutures. The wound healed by primary intention.

Histologic sections of the excised tissue revealed sections of skin showing epithelial atrophy and focal ulceration with subepithelial, intradermic, discrete and confluent granulomatous lesions, each consisting of compact collections of mononuclear cells with scattered lymphocytes, fibrocytes and a few giant cells of the Langhans and foreign body type. An occasional lesion showed a mild degree of central degeneration, but frank necrosis was not observed. A few of the lesions revealed internal hyalinization without concentric arrangement. Doubly contoured or concentrically laminated inclusion bodies were found within a few of the giant cells and also free within the lesions proper.

A diagnosis of subepidermal granuloma, resulting from local implantation of a beryllium phosphor, was made.

The patient was last seen in the outpatient department of the hospital on Sept. 7, 1948. At that time, there was no evidence of recurrence of the facial lesions and the operative scars were thin and inconspicuous. A roentgenogram of the chest revealed no evidence of pulmonary or pleural changes.

COMMENT

Lacerations caused by broken fluorescent bulbs may result in cutaneous lesions which are histologically similar to Boeck's sarcoid. Physicians who have occasion to treat such injuries should be aware of this possibility and should follow these patients for several years. The development of nodules and ulceration at the site of lacerations caused by broken fluorescent bulbs should arouse suspicion of granuloma due to beryllium. These suspicious lesions must be widely excised and subjected to careful histologic examination. One of the lesions reported by Grier, Nash and Freiman [5] was inadequately excised, and recurrence of the granuloma occurred. It is because of this danger of recurrence that wide excision is advised.

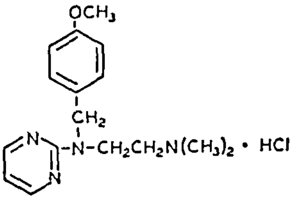
Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

THONZYLAMINE HYDROCHLORIDE.—"Neohetramine Hydrochloride"-Wyeth.—N,N-Dimethyl-N'-(p-methoxybenzyl)-N'-(2-pyrimidyl) ethylenediamine hydrochloride. —$C_{16}H_{22}N_4O.HCl$.—M. W. 322.83.—The structual formula for thonzylamine hydrochloride may be represented as follows:



Actions and Uses.—The therapeutic action of thonzylamine hydrochloride is qualitatively the same as with other members of the antihistaminic series, but the frequency and degree of effectiveness is of a lower order. Its outstanding advantage is that it is tolerated better than the other compounds, sedation being less frequent and less severe.

Dosage.—The average adult dose is 100 mg.

Tests and Standards.—

Thonzylamine hydrochloride occurs as a white, crystalline powder, having a faint odor. It melts between 173 and 176 C. It is very soluble in water, freely soluble in alcohol and chloroform, and practically insoluble in ether. The free base is obtained as an oil on the addition of 5 per cent sodium hydroxide to an aqueous solution of thonzylamine hydrochloride. A 2 per cent aqueous solution of thonzylamine hydrochloride has a *p*H between 5.1 and 5.7.

Dissolve about 25 mg. of thonzylamine hydrochloride in 5 cc. of water. Add a few drops of nitric acid, followed by 1 cc. of silver nitrate T. S.: a white precipitate of silver chloride is obtained. Add about 50 mg. of thonzylamine hydrochloride to 2 cc. of sulfuric acid: a pink solution is obtained which turns red on standing.

Add 3 drops of a saturated aqueous solution of Reinecke's salt to 2 cc. of a 2 per cent aqueous solution of thonzylamine hydrochloride: a pink precipitate is formed.

Dissolve about 0.1 Gm. of thonzylamine hydrochloride in 25 cc. of water and add the solution to 25 cc. of a saturated aqueous solution of picric acid containing 0.2 cc. of sulfuric acid. The yellow thonzylamine dipicrate obtained melts between 141 and 145 C.

Dissolve 1 Gm. of thonzylamine hydrochloride in 25 cc. of water. Add 1 cc. of diluted hydrochloric acid and then add 10 cc. of hydrogen sulfide T.S. The color produced is less than that obtained when 3 cc. of standard lead solution *(U.S.P. XIII)* is treated in a similar manner *(heavy metals)*.

Dry about 1 Gm. of thonzylamine hydrochloride, accurately weighed, at 110 C. for 4 hours: the loss in weight does not exceed 0.5 per cent.

Char about 0.5 Gm. of thonzylamine hydrochloride, accurately weighed, over a low flame. Cool, then add 1 cc. of sulfuric acid and continue ignition until no carbon remains: the residue should not exceed 0.1 per cent.

Transfer 0.1 Gm. of thonzylamine hydrochloride, accurately weighed, to a 100 cc. volumetric flask and dilute to the mark with alcohol. Mix thoroughly and transfer 10 cc. of the solution to another 100 cc. volumetric flask. Dilute to 100 cc. with alcohol; mix well and transfer 10 cc. of the solution to a third 100 cc. volumetric flask and dilute to 100 cc. The final solution (0.001 per cent) exhibits an ultraviolet absorption maximum at 2440 A. $(E^{1\%}_{1\ cm.} = 750 \pm 7)$ with minor peaks at approximately 2780, 2835 and 3070 A., and exhibits minimums at approximately 2680, 2800 and 2920 A.

Transfer 0.1 Gm. of dry thonzylamine hydrochloride to a semi-micro Kjeldahl flask and digest with 5 cc. of sulfuric acid, 2 Gm. of potassium sulfate, 0.2 Gm. of copper sulfate and 1 cc. of 30 per cent hydrogen peroxide. Dilute the clear solution to 15 cc. with water, make alkaline with 40 per cent sodium hydroxide, and distil the ammonia into 75 cc. of 0.02 *N* sulfuric acid. Titrate the excess acid with 0.02 *N* sodium hydroxide, using methyl red T.S. as an indicator. The nitrogen content is not less than 17.0 nor more than 17.6 per cent.

Transfer about 0.5 Gm. of dry thonzylamine hydrochloride, accurately weighed, to a separatory funnel. Add 25 cc. of water and 5 cc. of 20 per cent sodium hydroxide, and extract the mixture with four 25 cc. portions of ether. Collect the ether extracts in a separatory funnel and wash them successively with two 10 cc. and one 5 cc. portions of water. Combine the water extracts, saturate them with sodium chloride, extract them with 10 cc. of ether, and add this ether to the combined ether extracts. Treat the combined ether extracts with two 25 cc. portions of 0.05 *N* hydrochloric acid, and then successively with 10 cc. and 5 cc. of water. Combine the acid and water extracts, heat gently until the ether is removed, cool, and titrate the excess acid with 0.05 *N* sodium hydroxide, using methyl red T.S. as an indicator. Each cc. of 0.05 *N* acid used is equivalent to 0.01614 Gm. of thonzylamine hydrochloride: the amount of thonzylamine hydrochloride is not less than 98.5 nor more than 101.5 per cent.

Tablets: Thonzylamine hydrochloride in tablets may be identified as the dipicrate by dissolving the tablets in water, making the solution basic with sodium hydroxide T.S., extracting the solution with ether, reextracting the ether solution with diluted hydrochloric acid and then treating the acid solution with an excess of a saturated aqueous solution of picric acid. The dipicrate obtained melts between 141 and 145 C.

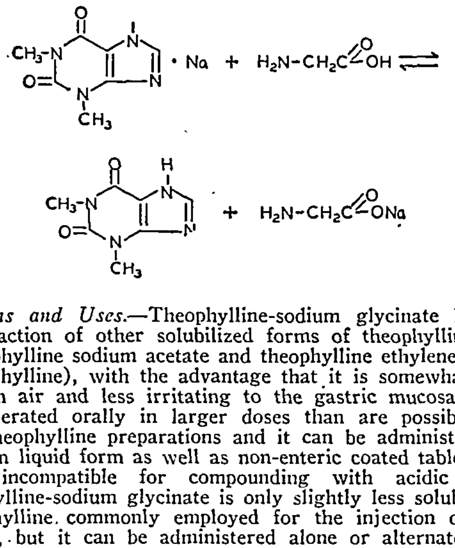
The tablets may be assayed by the method described in the monograph on thonzylamine hydrochloride. They contain not less than 95 nor more than 105 per cent of the claimed amount.

Wyeth, Incorporated, Philadelphia 3

Syrup Neohetramine: 6.25 mg. per cc., 475 cc. bottles.

Tablets Neohetramine: 25 mg., 50 mg. and 100 mg.

THEOPHYLLINE-SODIUM GLYCINATE.—"Glynazan."-First Texas Chemical.—"Glytheonate"-Patch.—"Synophylate"-Central. — "Theoglycinate"-Brayten. — $C_7H_8N_4O_2.C_2H_4NNaO$. — F. W. 491.4. — Theophylline-sodium glycinate contains slightly more than two moles of glycine to one mole of theophylline sodium. It contains not less than 49 nor more than 52 per cent Theophylline-U.S.P. It is considered to exist in a state of equilibrium which may be represented as follows:



Actions and Uses.—Theophylline-sodium glycinate has the typical action of other solubilized forms of theophylline such as theophylline sodium acetate and theophylline ethylenediamine (aminophylline), with the advantage that it is somewhat more stable in air and less irritating to the gastric mucosa. It is thus tolerated orally in larger doses than are possible with other theophylline preparations and it can be administered by mouth in liquid form as well as non-enteric coated tablet form. It is incompatible for compounding with acidic drugs. Theophylline-sodium glycinate is only slightly less soluble than aminophylline, commonly employed for the injection of theophylline, but it can be administered alone or alternated with penicillin as an aerosol for inhalation in the treatment of severe bronchial asthma. Until more evidence becomes available, claims for the uses of theophylline-sodium glycinate are restricted to those recognized for aminophylline; its value in cardiac conditions other than paroxysmal cardiac dyspnea is considered to be unestablished.

Dosage.—Theophylline-sodium glycinate consists of approximately 50 per cent of anhydrous theophylline whereas aminophylline consists of approximately 80 per cent. The dose of theophylline-sodium glycinate would thus be expected to be about one-third more than aminophylline. Orally, either as powder, tablets, elixir or syrup: Adults, 0.3 Gm. to 1.0 Gm.; children over 12 years, 0.15 Gm. to 0.4 Gm., children 6 to 12 years, 0.1 Gm. to 0.2 Gm. every four to six hours. The powder or tablets are preferably administered with water after meals. Suppositories are recommended only for adults until rectal doses for children are established. The adult rectal dose is 0.78 Gm. every 4 to 6 hours. Oral doses for children under 6 years are also unestablished.

Theophylline-sodium glycinate may be administered as an aerosol by nebulization with oxygen of a 5 to 10 per cent solution for inhalation, preferably under a canopy. Nebulization of 2 cc. of such a solution every four hours may be effective in refractory cases of bronchial asthma; very severe dyspnea may require continuous therapy or alternate inhalation of nebulized anti-infective agents such as penicillin.

Tests and Standards.—

Theophylline-sodium glycinate occurs as a white, odorless powder with the characteristic bitter taste of theophylline. It decomposes between 190 and 210 C. It is freely soluble in water and decomposed by acids.

Theophylline-sodium glycinate responds to the tests for Theophylline in *U.S.P. XIII,* p. 565.

Theophylline-Sodium Glycinate Powder: The powder responds to the tests for Theophylline in *U.S.P. XIII,* p. 565.

Theophylline-Sodium Glycinate Tablets: These tablets respond to the tests for Theophylline Tablets in *U.S.P. XIII,* p. 566.

Theophylline-Sodium Glycinate Suppositories: Place 5 suppositories in a beaker containing 50 cc. of water and dissolve them by heating on a steam bath. Cool the beaker in an ice bath until the fatty material congeals. Filter the solution through glass wool into a 250 cc. volumetric flask. Transfer the glass wool and residue to the original beaker. Add 50 cc. of water, heat the beaker on a steam bath, and again cool it in an ice bath and filter the solution through glass wool into the volumetric flask. Repeat the operation once more. Dilute the combined filtrates to volume. Proceed as directed in the *U.S.P. XIII,* p. 566, under the Theophylline assay beginning with "Transfer an accurately measured aliquot of the filtrate . . ."

Brayten Pharmaceutical Company, Chattanooga, Tenn.

Theoglycinate (*Powder*): Bulk. 113 Gm. bottles.

Suppositories Theoglycinate: 0.78 Gm.

Syrup Theoglycinate: 0.13 Gm. per 4 cc., 240 cc. bottles.

The E. L. Patch Company, Boston

Glytheonate (*Powder*): 113 Gm. and 454 Gm. bottles.

Suppositories Glytheonate: 0.78 Gm.

Tablets Glytheonate: 0.324 Gm.

Licensed under U. S. patent 2,433,765; U. S. trademark pending.

AMINOPEPTODRATE.—"Caminoids"-Arlington.—An enzymatic digest of extracted liver and beef muscle, wheat gluten, soya, yeast, casein and lactalbumin with dextrose, maltose and sucrose, containing amino acids and polypeptides equivalent to proteins (N x 6.25) 45% and carbohydrates 40% to provide a total of 350 available calories per 100 Gm.

Actions and Uses.—Aminopeptodrate is used to supplement the diet in conditions in which specially high protein intake is indicated and it is most feasible to accomplish this by use of ordinary foods.

Dosage.—Aminopeptodrate provides the average adult daily protein requirement when administered in amounts of one Gm. per kilogram of body weight per twenty-four hour period. It is administered orally in either hot or cold liquids as suited to the patients.

Arlington Chemical Company, Yonkers, N. Y.

Caminoids: 170.1 Gm., 453.6 Gm., 2.27 Kg. and 4.54 Kg. containers. One tablespoonful (9 Gm.) contains 4 Gm. of protein as partial hydrolysate.

SATURDAY, APRIL 23, 1949

ATLANTIC CITY SESSION

Again in June the American Medical Association will hold its annual session in Atlantic City. Already indications point to a tremendous attendance—well up to the great numbers of physicians who attended recent sessions in that city. More than 16,000 physicians were registered there in 1947, which was the Centennial meeting. Since the members of the Association may attend the session in 1949 for the first time, a record attendance may be anticipated. Members of the Association will not, of course, participate in the program or take part in the discussions, since these prerogatives are limited to Fellows of the American Medical Association. Members will, however, have full opportunity to attend the various functions, to view the exhibits (both scientific and technical) and to attend meetings of the sections. A special badge will be developed for members who register at the session. Incidentally, the American Medical Association does not require a registration fee from Fellows, members or guests.

The Council on Scientific Assembly and the secretaries of the individual sections have cooperated in the development of an extraordinarily interesting program covering every phase of current interest in the field of medicine. The many scientific sections, which this year include new meetings on allergy, diseases of the chest and the history of medicine, will attract many physicians whose special interests in these fields have not previously been so completely covered. Attention should be called also to the meetings dealing with advancement in medicine and in surgery under the direction and sponsorship of Drs. Roger I. Lee and Frank Lahey of Boston. These two sessions are in themselves a great contribution to graduate medical training. New also will be a special session of the Section on Preventive and Industrial Medicine and Public Health devoted to the timely topic of air pollution. Until the Donora episode, public interest in this subject was casual. Now people are asking about smoke and smog. The engineers and others who are concerned with measures for control seem to be thinking still of smog in terms of a nuisance rather than a public health problem. The symposium on environmental hygiene, directed primarily to this subject and concerning as well the possibility of a relationship between cancer and the inhalation of aromatic hydrogens, may well be one of the outstanding contributions of the annual session.

The usual scientific and technical exhibits will occupy the major portion of the great floor of the Atlantic City Convention Hall, and special exhibits designed for arthritis will be unique. The International Congress on Arthritis and Rheumatic Diseases will meet in New York City just prior to the annual session. Most of the invited guests from other countries will attend the Atlantic City session and participate in the special exhibits and considerations on this subject.

At the Chicago session and the St. Louis session, television was a striking contribution to new methods of visual education. At the Atlantic City session a program involving the use of television for teaching surgery will be unusual. Dr. Ravdin of the University of Pennsylvania will bring patients and equipment to the Atlantic City Hospital, and television in four colors will be available to convention visitors in the Convention Hall. Use of television in making roentgenograms clearer and sharper will be a contribution from the University of Illinois College of Medicine. Investigators found that an extremely high degree of accuracy can be obtained in presenting roentgen ray films on television. The four color surgical television is sponsored by Smith, Kline & French and the Columbia Broadcasting Company. The roentgen ray television is sponsored by E. R. Squibb & Sons and the R.C.A. division of the Radio Corporation of America.

To the usual attractions of Atlantic City, including the famous boardwalk along the ocean, the excellent golf courses and the magnificent hotels, will be added special features by the American Medical Association. A religious service similar to the one of 1947 is planned for Sunday. Also on that day will be a Grass Roots Conference for county medical society secretaries. The House of Delegates will begin its sessions on Monday, and a dinner is planned for Monday night. The opening general meeting on Tuesday night will feature a musical organization, probably the Westminster choir. On Wednesday night a commercial sponsor will offer a program of entertainment with radio stars similar to that which drew a capacity attendance in St. Louis. Also on this night will be the usual alumni, fraternity and specialist dinners. The president's reception will be held as usual on Thursday night. The Woman's Auxiliary has also developed a comprehensive program of discussions, luncheons and dinners. The president of the Woman's Auxiliary will participate in the open general meeting, and members of the Woman's Auxiliary are expected to attend this meeting with their husbands.

So great has been the demand for rooms in Atlantic City that arrangements are being made for special trains and busses to go regularly between Philadelphia and Atlantic City to provide for an overflow attendance. The cities near to Atlantic City will also make their facilities available.

The House of Delegates at the Atlantic City session will be concerned with current problems of great importance to American medicine. A variety of legislation dealing with medical care is under consideration by the House and the Senate. From present indications this legislation will still be in process of hearings by the time of the Atlantic City session and the House of Delegates will have full opportunity to study the views of representatives of most American physicians at that time. Current newspaper reports indicate that President Truman proposes to send his health message to Congress perhaps by the time this editorial is published. That too will be available for consideration by the House of Delegates. The coordinating committee which is in charge of the educational program for the American people on medical care in the United States will no doubt report to the House of Delegates the progress of their activities, as will the special public relations counsel in charge of this work. The Council on National Emergency Medical Service is actively engaged in developing the necessary personnel for the armed forces, and policies of the medical profession in relationship to military service will be considered. The Council on Medical Service has been conducting conferences with representatives of industry, labor, agriculture, insurance and other groups especially concerned with medical care. The report of this Council will no doubt occupy much of the time of the House of Delegates. The Council on Medical Education and Hospitals has begun a new survey of medical education in the United States, and a number of bills have been introduced into the Congress proposing various forms of federal aid to medical education. These policies likewise must be determined by the House of Delegates.

The Atlantic City session will obviously be one of the most important held by the greatest medical organization in the world, and the decisions of that session will be vitally significant in determining the future of medicine in our country.

CANCEROUS MELANOMA

The skin contains dendritic pigment-bearing cells in the lowermost layer known as chromatophores. They are present in greatest abundance in the dark races. In the Caucasian such cells are rarely evident except in localities protected from light, as in the areola of the nipple and the margins of the anus. The same variety of pigment cell occurs normally in the retina and choroid coat of the eye, in the interstices of the ciliary muscle and in the matrix of hairs. The chromatophore sometimes undergoes cancerous transformation, giving rise to a tumor which is extremely vicious —the so-called melanoma or melanotic sarcoma. As the position of the chromatophore among cells is still undetermined, the place of the melanoma among tumors is likewise debatable. Some regard the chromatophore as epithelial, some as endothelial, others as neurogenic and still others as a connective tissue cell. Consequently, the tumor which it causes is variously classified as a carcinoma, endothelioma, malignant neuroma or melanotic sarcoma. Stewart and Bonser [1] described a series of 57 epidermal pigment-forming tumors which they classify as "squamous papillomas, benign calcified epitheliomas, basal cell carcinomas and squamous carcinomas." They maintain, "These tumors have nothing in common with the malignant melanoma of the skin or its benign counterpart, except that they are pigment-forming."

Every one has one or more moles, and every mole is a potential source of a melanoma. The mole is a development characterized, even in the resting state, by an arrangement of chromatophores that bears a resemblance to that of a tumor. In fact, the number, formation and chromatic richness of the cells in many instances are such that a given microscopic field might be mistaken for a tumor with established cancerous qualities rather than an apparently trivial congenital malformation in the skin. The mole undisturbed may never cause trouble; in fact, the great majority maintain innocent quiet. If, however, a mole is located where it is exposed to frequent irritation or, as too often happens, a mole is deliberately subjected to ligation or to the action of escharotics by either the host himself or ignorant meddlers, a growth of highly dangerous qualities may develop. Moreover, cancerous transformation may occur soon after such interference, or it may be postponed for months or even for many years. In short, the skin mole should be left to its own devices or, if removal is considered advisable, the sacrifice of a considerable sweep of apparently healthy skin and subcutaneous tissue should be made.

Rarely in man and oftener in certain of the lower animals, notably in the snout of the pig, curious pigmented nerve end organs are found. These may proliferate to form the so-called neuronevus, a pigmented growth which may or may not be cancerous. In man the neuronevus may involve almost any part of the skin but is perhaps most common in the scalp. Histologically, the growth is composed of nonmyelinated strands arranged in whorl-like fashion resembling the structure of the end organs.

A peculiarity of the melanoma is that it may metastasize to other tumors. In one case of this sort, a myofibroma of the uterus revealed multiple pigmented metastatic deposits; in another case, a cystadenoma of the ovary was similarly metastasized and, in still another case, a fibroadenoma of the female breast showed a solitary metastatic deposit four years after the removal of a melanotic tumor of the eyeball.

AMINO ACID NEEDS FOR MAINTENANCE

Early in this century, attention of physiologic chemists was turned from a consideration of the quantity of protein required for physiologic well-being to the possible significance of the quality of food proteins. Largely as a consequence of the investigations of Fischer, Hopkins and Osborne and Mendel, the conception became established that for adequate growth certain of the amino acids into which proteins can be degraded through hydrolysis are indispensable, whereas other amino acids can apparently be synthesized by the animal organism itself. Through the more recent studies of Rose and his collaborators the list of these indispensable dietary components has been extended, until now there are ten amino acids recognized as "essential" for the growth of the young of those mammals thus far investigated, provided the rest of the diet is adequate nutritionally. With the generally increasing interest in the welfare of the adult and the aged, attention has been directed to the amino acid requirement for maintenance. An early study [1] on the rat indicated that all of the amino acids needed for growth in this species are also required for maintenance of the fully grown animal. Rose and Rice [2] showed that the adult dog can be maintained in nitrogen equilibrium when only nine of the essential amino acids are present in the ration. Later it was recorded [3] that of the ten amino acids needed for growth only six were required to maintain nitrogen balance in the adult rat. Of particular interest is the demonstration [4] that the adult human subject can maintain nitrogen equilibrium on only eight of the so-called "essential" amino acids. More recent studies have been carried out in an effort to define more clearly the nitrogenous needs for maintenance. With the regeneration of plasma proteins as a criterion, nine of the "essential" amino acids sufficed,[5] and, when maintenance of nitrogen balance was the criterion, again the same nine amino acids appeared adequate.[6]

The ten amino acids currently regarded as "essential" on the basis of growth of young laboratory rats are tryptophane, lysine, histidine, valine, threonine, methionine, leucine, isoleucine, phenylalanine and arginine. Arginine appears to be synthesized by the mammals thus far studied, in sufficient quantity to satisfy the physiologic needs for maintenance [7] of the adult. In addition, histidine is not required by the adult human subject. With the advent of widespread clinical use of hydrolyzed proteins and amino acid mixtures, a reliable background of experimental evidence is needed regarding the adequacy of these dietary devices in adult nutrition as well as during growth.

Current Comment

DOCTORS DO NOT LIVE LONGER

Elsewhere in this issue is a discussion of the leading causes of death among physicians in 1948. This analysis of the obituaries published in THE JOURNAL during 1948 shows that heart disease is still an occupational hazard of the medical profession. When allowance is made for the peculiar age distribution of the physician population, the average age at death is about the same as it would be for white males of the same ages chosen at random from the general population, although the pattern of causes of death is different. The present study confirms the earlier study by Dublin and Spiegelman which was based on the mortality of physicians during the five year period 1938-1942. Apparently the members of the medical profession cannot give their fellow members longer life than their patients enjoy. Physicians as a class enjoy the best of medical care; yet they do not live longer than other white males.

KNOW THYSELF

Recently Franz Alexander,[1] writing on "Emotional Maturity," emphasized that the Greek maxim "Know thyself" may once have been a luxury but has today become a necessity. If the world and the individual were both stable the application of fixed automatic patterns could insure harmonious adaptation to conditions. Adults who live under extremely stable conditions would not need the great ability in flexible adaptation necessary in a rapidly changing environment. In the feudal period in Europe when conditions and customs remained the same from generation to generation and the place of each person was rigidly determined by society, the same behavior patterns handed down from parent to child provided for sufficient adaptability. However, in the present industrial era rapid social change, which has been described as the most conspicuous feature of present times, requires that each person make several rapid readjustments to changing material and ideologic situations. Therefore, the comforts of life according to well tested traditions cannot be enjoyed by man in the modern era. In order to make the proper readjustment people must become more aware of themselves, their desires, impulses, motives and needs; in other words, more self reliant and more mature. Only by the development of personal security through self knowledge can the productive state of mind be reached which will allow each person to turn his interest outward toward the problems of his environment. As adaptability is the faculty of the conscious ego, the aim of psychoanalysis is to increase the effectiveness of the conscious ego by replacing automatic adaptations and repressions by conscious and flexible adjustments. The increasing complexities of modern life require increasing attention and effort by each person to reach and maintain emotional security. Lack of such security leads to confusion, fear and a tendency to regress to dependent ways of childhood, where security lies in unthinking, unquestioning, obedience.

THE ATLANTIC CITY SESSION

AMERICAN MEDICAL ASSOCIATION, NINETY-EIGHTH ANNUAL SESSION
ATLANTIC CITY, JUNE 6-10, 1949

OFFICIAL CALL

To the Officers, Fellows and Members of the American Medical Association

The ninety-eighth annual session of the American Medical Association will be held in *Atlantic City, N. J., June 6-10, 1949.*

The House of Delegates will convene at 10 a. m. Monday, June 6. In the House the representation of the various constituent associations for 1949 is as follows:

Alabama	2	New Hampshire	1
Arizona	1	New Jersey	5
Arkansas	2	New Mexico	1
California	10	New York	23
Colorado	2	North Carolina	3
Connecticut	3	North Dakota	1
Delaware	1	Ohio	8
District of Columbia	2	Oklahoma	2
Florida	2	Oregon	2
Georgia	3	Pennsylvania	11
Idaho	1	Rhode Island	1
Illinois	10	South Carolina	2
Indiana	4	South Dakota	1
Iowa	3	Tennessee	3
Kansas	2	Texas	7
Kentucky	2	Utah	1
Louisiana	2	Vermont	1
Maine	1	Virginia	3
Maryland	2	Washington	3
Massachusetts	7	West Virginia	2
Michigan	5	Wisconsin	3
Minnesota	4	Wyoming	1
Mississippi	2	Alaska	1
Missouri	4	Hawaii	1
Montana	1	Isthmian Canal Zone	1
Nebraska	2	Puerto Rico	1
Nevada	1		

The scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy, the Public Health Service and the Veterans Administration are entitled to one delegate each.

The Scientific Assembly of the Association will open with the General Scientific Meetings to be held Monday, June 6, starting at 2 p. m. and continuing throughout the morning and afternoon of Tuesday, June 7. The Inauguration Meeting at which the President will be installed will be held on Tuesday, June 7, starting at 8 p. m. The sections will meet Wednesday, Thursday and Friday, June 8, 9 and 10, as follows:

CONVENING AT 9 A. M.
THE SECTIONS ON

Internal Medicine.
Obstetrics and Gynecology.
Laryngology, Otology and Rhinology. (No Friday meeting)
Pathology and Physiology.
Orthopedic Surgery.
Urology.
Preventive and Industrial Medicine and Public Health.
Anesthesiology.
General Practice of Medicine.
Miscellaneous Topics:
Sessions on Physical Medicine; Session on Allergy.

CONVENING AT 2 P. M.
THE SECTIONS ON

Pediatrics.
Surgery, General and Abdominal.
Ophthalmology.
Experimental Medicine and Therapeutics.
Nervous and Mental Diseases.
Dermatology and Syphilology.
(No Friday meeting)
Gastro-Enterology and Proctology.
Radiology.
Diseases of Chest. (No Friday meeting)

The Registration Bureau, which will be located in the Convention Hall will be open from 8:30 a. m. until 5:30 p. m. Monday, Tuesday, Wednesday and Thursday, June 6, 7, 8 and 9, and from 8:30 a. m. to 12 noon Friday, June 10.

R. L. SENSENICH, President.
F. F. BORZELL, Speaker, House of Delegates.
GEORGE F. LULL, Secretary.

MEMBERS OF THE HOUSE OF DELEGATES

A Preliminary Roster of the Legislative Body of the American Medical Association

The list of members of the House of Delegates for the session is incomplete. The following is a list of the holdover members of the House of Delegates and of the newly elected members who have been reported to the Secretary in time to be included:

STATE DELEGATES

ALABAMA
Lloyd Noland, Fairfield
Carl A. Grote, Huntsville

ARIZONA
Jesse D. Hamer, Phoenix

ARKANSAS
William R. Brooksher, Fort Smith

CALIFORNIA
Robertson Ward, San Francisco
Samuel J. McClendon, San Diego
Lowell S. Goin, Los Angeles
John Winston Green, Vallejo
H. Gordon MacLean, Oakland
E. Vincent Askey, Los Angeles
John W. Cline, San Francisco
Donald Cass, Los Angeles
Ralph B. Eusden, Long Beach

COLORADO
George A. Unfug, Pueblo
William H. Halley, Denver

CONNECTICUT
Thomas P. Murdock, Meriden
Joseph H. Howard, Bridgeport
Creighton Barker, New Haven

DELAWARE
James Beebe, Lewes

DISTRICT OF COLUMBIA
Coursen B. Conklin, Washington
Herbert P. Ramsey, Washington

FLORIDA
Louis M. Orr II, Orlando
Homer L. Pearson Jr., Miami

GEORGIA
Allen H. Bunce, Atlanta
Benjamin H. Minchew, Waycross

IDAHO
H. B. Woolley, Idaho Falls

ILLINOIS
Rollo K. Packard, Chicago
Charles H. Phifer, Chicago
G. Henry Mundt, Chicago
Bernard Klein, Joliet
Willis I. Lewis, Herrin

INDIANA
William M. Cockrum, Evansville
Albert M. Mitchell, Terre Haute
Homer G. Hamer, Indianapolis
E. S. Jones, Hammond

IOWA
Thomas F. Thornton, Waterloo
George Braunlich, Davenport
Gerald V. Caughlan, Council Bluffs

KANSAS
John M. Porter, Concordia
Philip W. Morgan, Emporia

KENTUCKY
Clark Bailey, Harlan
Joshua B. Lukins, Louisville

LOUISIANA
James Q. Graves, Monroe
Val H. Fuchs, New Orleans

MAINE
Thomas A. Foster, Portland

MARYLAND
Jacob W. Bird, Sandy Spring
Warde B. Allan, Baltimore

MASSACHUSETTS
Charles J. Kickham, Brookline
Leland S. McKittrick, Brookline
Patrick J. Sullivan, Dalton
John J. Curley, Leominster
Walter G. Phippen, Salem
Frank W. Snow, Newburyport
Earle M. Chapman, Boston

MICHIGAN
Leo G. Christian, Lansing
William A. Hyland, Grand Rapids
Wyman D. Barrett, Detroit
Thomas K. Gruber, Eloise
Willis H. Huron, Iron Mountain

MINNESOTA
Erling W. Hansen, Minneapolis
George A. Earl, St Paul
William A. Coventry, Duluth
J. Arnold Bargen, Rochester

MISSISSIPPI
James P. Wall, Jackson
Felix J. Underwood, Jackson

MISSOURI
Howard B. Goodrich, Hannibal
Warren L. Allee, Eldon

MONTANA
Raymond F. Peterson, Butte

NEBRASKA
Karl S. J. Hohlen, Lincoln
Joseph D. McCarthy, Omaha

NEVADA

Roland W. Stahr, Reno

NEW HAMPSHIRE

Deering G. Smith, Nashua

NEW JERSEY

Joseph F. Londrigan, Hoboken
William F. Costello, Dover
J. Wallace Hurff, Newark
David B. Allman, Atlantic City
Thomas K. Lewis, Camden

NEW MEXICO

John F. Conway, Clovis

NEW YORK

John J. Masterson, Brooklyn
J. Stanley Kenney, New York
Thomas A. McGoldrick, Brooklyn
Andrew A. Eggston, Mount Vernon
Peter J. DiNatale, Batavia
George W. Kosmak, New York
Stephen R. Monteith, Nyack
Joseph P. Henry, Rochester
Scott Lord Smith Poughkeepsie
Thomas M. D'Angelo, Flushing
Walter P. Anderton, New York
Albert F. R. Andresen, Brooklyn
James R. Reuling, Bayside
Floyd S. Winslow, Rochester
Herbert H. Bauckus, Buffalo
Thomas M. Brennan, Brooklyn
Ralph T. B. Todd, Tarrytown
William B. Rawls, New York
Edward P. Flood, New York
Leo F. Schiff, Plattsburg
W. Guernsey Frey Jr., New York
B. Wallace Hamilton, New York
Clarence G. Bandler, New York

NORTH CAROLINA

Roscoe D. McMillan, Red Springs
Charles F. Strosnider, Goldsboro
George Grady Dixon, Ayden

NORTH DAKOTA

Glenn W. Toomey, Devils Lake

OHIO

L. Howard Schriver, Cincinnati
Clifford C. Sherburne, Columbus
Frank M. Wisely, Findlay
Edgar P. McNamee, Cleveland
Carl A. Lincke, Carrollton
George A. Woodhouse, Pleasant Hill
William M. Skipp, Youngstown

OKLAHOMA

Charles R. Rountree, Oklahoma City
James Stevenson, Tulsa

OREGON

Edward H. McLean, Oregon City
Raymond M. McKeown, Coos Bay

PENNSYLVANIA

William L. Estes Jr., Bethlehem
James L. Whitehill, Rochester
George S. Klump, Williamsport
Elmer Hess, Erie
James Z. Appel, Lancaster
E. Roger Samuel, Mount Carmel
William Bates, Philadelphia
Francis F. Borzell, Philadelphia
Harold B. Gardner, Pittsburgh
Charles L. Shafer, Kingston
Howard K. Petry, Harrisburg

RHODE ISLAND

Herman A. Lawson, Providence

SOUTH CAROLINA

Hugh P. Smith, Greenville

SOUTH DAKOTA

H. Russell Brown, Watertown

TENNESSEE

Hiram B. Everett, Memphis
Robert B. Wood, Knoxville

TEXAS

Howard R. Dudgeon, Waco
Britton E. Pickett Sr., Carrizo Springs
Edward H. Cary, Dallas
F. J. L. Blasingame, Wharton
Allen T. Stewart, Lubbock
Robert B. Homan Jr., El Paso

UTAH

James P. Kerby, Salt Lake City

VIRGINIA

Henry B. Mulholland, Charlottesville
J. Morrison Hutcheson, Richmond
John M. Emmett, Clifton Forge

WASHINGTON

Ross D. Wright, Tacoma
Raymond L. Zech, Seattle
Donald G. Corbett, Spokane

WEST VIRGINIA

Ivan Fawcett, Wheeling
Walter E. Vest, Huntington

WISCONSIN

William D. Stovall, Madison
Stephen E. Gavin, Fond du Lac
James C. Sargent, Milwaukee

WYOMING

Roscoe H. Reeve, Casper

ALASKA

Paul B. Haggland, Fairbanks

HAWAII

Forrest J. Pinkerton, Honolulu

CANAL ZONE

George R. Wright, Ancon

DELEGATES FROM THE SECTIONS AND GOVERNMENT SERVICES

INTERNAL MEDICINE

Charles T. Stone, Galveston, Texas

SURGERY, GENERAL AND ABDOMINAL

Grover C. Penberthy, Detroit

OBSTETRICS AND GYNECOLOGY

Jean Paul Pratt, Detroit

OPHTHALMOLOGY

William L. Benedict, Rochester, Minn.

LARYNGOLOGY, OTOLOGY AND RHINOLOGY

Gordon F. Harkness, Davenport, Iowa

PEDIATRICS

William Weston, Columbia, S. C.

EXPERIMENTAL MEDICINE AND THERAPEUTICS

Edgar V. Allen, Rochester, Minn.

PATHOLOGY AND PHYSIOLOGY

Leonard W. Larson, Bismarck, N.D.

NERVOUS AND MENTAL DISEASES

Hans H. F. Reese, Madison, Wis.

DERMATOLOGY AND SYPHILOLOGY

Everett C. Fox, Dallas, Texas

PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

Stanley H. Osborn, Hartford, Conn.

UROLOGY

Roy B. Henline, New York

ORTHOPEDIC SURGERY

Edward L. Compere, Chicago

GASTRO-ENTEROLOGY AND PROCTOLOGY

Louis A. Buie, Rochester, Minn.

RADIOLOGY

Byrl R. Kirklin, Rochester, Minn.

ANESTHESIOLOGY

Henry S. Ruth, Haverford, Pa.

GENERAL PRACTICE

Paul A. Davis, Akron, Ohio

OFFICERS OF THE AMERICAN MEDICAL ASSOCIATION, 1948-1949

President—R. L. Sensenich, South Bend, Ind.

President-Elect—Ernest E. Irons, Chicago

Vice President—Roy W. Fouts, Omaha.

Secretary and General Manager—George F. Lull, Chicago

Asst. Secretary—Ernest B. Howard, Chicago.

Treasurer—J. J. Moore, Chicago.

Speaker, House of Delegates—F. F. Borzell, Philadelphia.

Vice Speaker, House of Delegates— James R. Reuling, Bayside, N. Y.

Editor—Morris Fishbein, Chicago.

Business Manager—Thomas R. Gardiner, Chicago.

Board of Trustees—Louis H. Bauer, Hempstead, N. Y., 1949; E. L. Henderson, Chairman, Louisville, Ky., 1949; John H. Fitzgibbon, Portland, Ore., 1950; James R. Miller, Hartford, Conn., 1950; Walter B. Martin, Norfolk, Va., 1951; Dwight H. Murray, Napa, Calif., 1952; E. J. McCormick, Toledo, Ohio, 1952; Edwin S. Hamilton, Kankakee, Ill., 1953; Gunnar Gundersen, LaCrosse, Wis., 1953.

Judicial Council—Edward R. Cunniffe, Chairman, New York, *1949*; Louis A. Buie, Rochester, Minn., 1950; Walter F. Donaldson, Pittsburgh, 1951; H. L. Pearson Jr., Miami, Fla., 1952; John H. O'Shea, Spokane, Wash., 1953; George F. Lull, Secretary, Chicago.

Council on Medical Education and Hospitals—Reginald Fitz, Boston, 1949; Russell L. Haden, Cleveland, 1950; W. S. Middleton, Madison, Wis., 1951; H. G. Weiskotten, Chairman, Syracuse, N. Y., 1952; Victor Johnson, Rochester, Minn., 1953; W. L. Pressly, Due West, S. C., 1954; Harvey B. Stone, Baltimore, 1955; Donald G. Anderson, Secretary, Chicago.

Council on Scientific Assembly—Charles H. Phifer, Chicago, 1949; Henry R. Viets, Chairman, Boston, 1950; L. W. Larson, Bismarck, N. D., 1951; Stanley P. Reimann, Philadelphia, 1952; Alphonse McMahon, St. Louis, 1953; and ex officio the President-Elect, the Editor and the Secretary of the Association.

Council on Medical Service—Elmer Hess, Erie, Pa., 1949; Thomas A. McGoldrick, Brooklyn, 1949; Jesse D. Hamer, Phoenix, Ariz., 1950; James R. McVay, Chairman, Kansas City, Mo., 1950; H. B. Mulholland, Charlottesville, Va., 1951; Joseph D. McCarthy, Omaha, 1951; Edward L. Bortz, Philadelphia; R. L. Sensenich, South Bend, Ind.; Walter B. Martin, Norfolk, Va.; George F. Lull, Chicago, Thomas A. Hendricks, Secretary, Chicago.

Council on Pharmacy and Chemistry (Standing Committee of Board of Trustees)—M. Fishbein, Chicago, 1950; G. W. McCoy, New Orleans, 1950; P. H. Long, Baltimore, 1950; *E. M. Nelson, Washington, D. C., 1950*; Torald Sollmann, Chairman, Cleveland, 1951; Isaac Starr, Philadelphia, 1951; R. F. Loeb, New York, 1951; E. M. K. Geiling, Chicago, 1952; S. W. Clausen, Rochester, N. Y., 1952; Paul R. Cannon, Chicago, 1952; Joseph Stokes, Jr., Philadelphia, 1953; C. Guy Lane, Boston, 1953; Robert T. Stormont, Washington, D. C., 1953; James P. Leake, Washington, D. C., 1954; W. B. Wood, Jr., St. Louis, 1954; Austin E. Smith, Secretary, Chicago.

Council on Physical Medicine and Rehabilitation (Standing Committee of Board of Trustees)—Anthony C. Cipollaro, New York, 1950; M. A. Bowie, Bryn Mawr, Pa., 1950; G. M. Piersol, Philadelphia, 1950; W. E. Garrey, Nashville, Tenn., 1951; W. W. Coblentz, Washington, D. C., 1951; John S. Coulter, Chairman, Chicago, 1951; Derrick Vail, Chicago, 1951; W. E. Grove, Milwaukee, 1951; A. C. Ivy, Chicago, 1952; Frank R. Ober, Boston, 1952; Frank D. Dickson, Kansas City, Mo., 1952; H. B. Williams, New York, 1953; Frank H. Krusen, Rochester, Minn., 1953; Shields Warren, Boston, 1953; Morris Fishbein, ex officio, Chicago; Howard A. Carter, Secretary, Chicago.

Council on Foods and Nutrition (Standing Committee of Board of Trustees)—Harold C. Stuart, Boston, 1950; Morris Fishbein, Chicago, 1950; R. M. Wilder, Rochester, Minn., 1951; Howard B. Lewis, Ann Arbor, Mich. 1951; J. S. McLester, Chairman, Birmingham, Ala., 1951; Philip C. Jeans, Iowa City, 1952; *C. A. Elvehjem, Madison, Wis., 1952*; William J. Darby, Nashville, Tenn., 1953; George R. Cowgill, New Haven, Conn., 1953; C. S. Ladd, Washington, D. C., 1954; John B. Youmans, Chicago, 1954; James R. Wilson, Secretary, Chicago.

Council on Industrial Health (Standing Committee of Board of Trustees)—Warren F. Draper, Washington, D. C., 1950; Raymond Hussey, Detroit, 1950; Henry H. Kessler, Newark, N. J., 1950; L. D. Bristol, Harris*burg, Pa., 1951; Paul B. Magnuson*, Washington, D. C., 1951; Robert A. Kehoe, Cincinnati, 1951; Harold A. Vonachen, Peoria, Ill., 1952; W. A. Sawyer, Rochester, N. Y., 1952; James S. Simmons, Boston, 1952; Rutherford T. Johnstone, Los Angeles, 1953; A. J. Lanza, Chairman, New York, 1953; C. D. Selby, Detroit, 1953; E. J. McCormick, Toledo, Ohio, ex officio; C. M. Peterson, Secretary, Chicago.

Council on National Emergency Medical Service (Standing Committee of Board of Trustees)—W. McK. Craig, Rochester, Minn.; Harold S. Diehl, Minneapolis; Perrin H. Long, Baltimore; Richard L. Meiling, Columbus, Ohio; Harold C. Lueth, Omaha; James C. Sargent, Chairman, Milwaukee; Stafford Warren, Los Angeles, and ex officio the President and the Secretary of the Association.

Committee on Scientific Exhibit—E. J. McCormick, Toledo, Ohio; Dwight H. Murray, Chairman, Napa, Calif.; Gunnar Gundersen, La Crosse, Wis.; Thomas G. Hull, Director, Chicago; Advisory Committee—Howard F. Root, Boston; Paul J. Hanzlik, San Francisco Ludvig Hektoen, Chicago; Urban Maes, New Orleans; Max M. Peet*, Ann Arbor, Mich.; James P. Leake, Washington, D. C.

THE CONVENTION HALL WHERE THE ANNUAL SESSION WILL BE HELD.

ATLANTIC CITY—1949

Again in 1949 the American Medical Association convenes in Atlantic City. This place was chosen by the House of Delegates and by the Board of Trustees because it offers the best available hotel facilities and convention auditorium in the United States. No doubt within the next ten years other cities will attempt to provide equal facilities. Thus far, however, no other city has a convention hall in which adequate space is available for the exhibits, the large meetings and the other features of a convention such as that of the American Medical Association.

The hotels of Atlantic City are in themselves one of the greatest attractions. Their glittering beauty excites the imagination. The many rooms that are available both in the Boardwalk hotels and those somewhat removed from the Boardwalk are well furnished, well ventilated and restful. The Boardwalk stretches for many miles along the ocean frontage and the intense activities in attendance on scientific sessions and on the technical and scientific exhibits yield to rest and relaxation by a stroll along the Boardwalk or by occupancy of the chairs propelled by manpower at a not too rapid gait from early morning until long past midnight. Far into the ocean stretch several piers devoted wholly to entertainment, including dancing, circuses, motion pictures and exhibits. At the ends of some of these piers boats are available for fishing. The atmosphere in general is one of gaiety.

Many of the restaurants and cafes of Atlantic City are world known for their cuisine. Any midwestern physician addicted to lobster, crab or any other seafood will find that Atlantic City's cafés and restaurants can provide everything that titillates the palate.

Several golf courses, not too far removed from the Boardwalk hotels, including particularly the famous Seaview Course, will attract the golfers who like courses with hazards based on shifting sand, towering bunkers and deep, deep traps. During the week of the annual session the facilities of these clubs are available to the convention visitors.

The American Medical Association during more than one hundred years of its existence has visited Atlantic City many times, and satisfaction has always been so great that on one occasion an action was taken to meet in Atlantic City every second year. One of the greatest thrills of the convention is to meet a classmate accidentally in the exhibit halls or on the Boardwalk and to exchange reminiscences of earlier days.

Especially significant of the Atlantic City session will be television programs devoted to newer discoveries in the use of the roentgen ray and to surgical procedures. The accessibility of these television programs will be such that many a physician will find himself actually peering over the shoulder of the surgeon as he operates, actually viewing the roentgenogram under conditions far more advantageous than would be possible even in the hospital. In this annual session every technic of visual education thus far established will be utilized for graduate study by the convention visitor. The features for entertainment, for the Woman's Auxiliary, for alumni associations and specialist groups constitute a program of convention features that is in every way the greatest that the medical world offers.

The annual session of 1947, which celebrated one hundred years of activity by the American Medical Association, attracted the largest medical attendance that any convention has ever mustered, including hundreds of visiting physicians from foreign countries. Already there are indications that the 1949 session may be even greater in attendance and in scope.

REGISTRATION

The Bureau of Registration will be located in Convention Hall. An information bureau will be operated in connection with the Bureau of Registration.

Who May Register

Only Fellows, Affiliate, Associate and Honorary Fellows and Invited Guests may register and take part in the work of the sections. Fellows of the Scientific Assembly are those who have, on the prescribed form, applied for Fellowship, subscribed to THE JOURNAL and paid their Fellowship dues for the current year. Fellowship dues and subscription to THE JOURNAL are included in the one annual payment of $12, which is the regular subscription price of THE JOURNAL. Fellowship cards are sent to all Fellows after payment of annual dues, and these cards should be presented at the registration window. Any who have not received cards for 1949 should secure them at once by writing to the American Medical Association, 535 North Dearborn Street, Chicago 10.

Members in Good Standing Eligible to Apply for Fellowship in the Association

Members in good standing in the American Medical Association are those members of component county medical societies and of constituent state and territorial medical associations whose names are officially reported for enrolment to the Secretary of the American Medical Association by the secretaries of the constituent medical associations. All members in good standing may apply for Fellowship in the Scientific Assembly and are urged to qualify as Fellows before leaving home in order that pocket cards may be secured and brought to Atlantic City so that registration can be more easily and more promptly effected.

Application forms may be had on request.

Those subscribers to THE JOURNAL who have not received pocket cards for 1949 should write to the American Medical Association in order to obtain application blanks and information as to further requirements.

Members who do not qualify as Fellows will be permitted to attend meetings but may not register as Fellows for the Scientific Assembly.

Register Early

Fellows living in Atlantic City as well as all other Fellows who are in Atlantic City on Monday and Tuesday, should register as early as possible.

The names and local addresses of those who register will be included in the issue of the *Daily Bulletin* appearing the next day, and this will enable visiting physicians to find friends who have registered.

Suggestions That Will Facilitate Registration

Fellows should fill out completely the spaces on both sections of the front of the registration card. Physicians who desire to qualify as Fellows should fill out completely the spaces on both sections of the front of the registration card and sign the application on the back. These cards will be found on the tables.

Entries on the registration card should be written plainly, or printed, as the cards are given to the printer to use as "copy" for the *Daily Bulletin*, which appears on Tuesday, Wednesday, Thursday and Friday mornings during the week of the session.

Fellows who have their pocket cards with them can be registered with little or no delay. They should present the filled out registration card, together with the pocket card, at one of the windows marked "Registration by Pocket Card." There the clerk will compare the two cards, stamp the pocket card and return it and supply the Fellow with a badge and a copy of the official program.

As previously stated, it will assist in the registration if those who desire to qualify as Fellows will file their applications and qualify as Fellows by writing directly to the American Medical Association, 535 North Dearborn Street, Chicago 10, so that their Fellowship may be entered not later than May 6. Any applications that are received later than May 6 will be given prompt attention, but the Fellowship pocket card may not reach the applicant in time for him to register at the Atlantic City session.

It will be possible for members of the organization to qualify as Fellows at Atlantic City. In order to do this, applicants for Fellowship will be required to fill out both sections of the front of the registration card and to sign the formal application that is printed on the reverse side of the card. It is suggested that those members who apply for Fellowship at Atlantic City bring with them their state membership cards for the year 1949. The state membership card should be presented along with the filled in registration card at the window in the booth marked "Applicants for Fellowship and Invited Guests."

As already stated, registration can be effected more easily and promptly if members will qualify as Fellows before leaving home.

Registration for General Officers and Delegates at the Hotel Traymore

General Officers of the American Medical Association and members of the House of Delegates may register for the Scientific Assembly outside the American Room of the Hotel Traymore. This arrangement is made for the convenience of members of the House of Delegates, which will convene on Monday morning at 10 o'clock in the American Room of the Hotel Traymore. Delegates are requested to register for the Scientific Assembly before presenting credentials to the Reference Committee on Credentials of the House of Delegates. Registration of delegates for the Scientific Assembly will begin at 8 o'clock Monday morning, June 6, and delegates are urged to register early so that all members of the House of Delegates may be seated in time for the opening session of the House. If any delegate is in Atlantic City on Sunday, June 5, he may register for the Scientific Assembly at the American Room of Hotel Traymore.

TRANSPORTATION

It is suggested that those Fellows who contemplate traveling to Atlantic City to attend the annual session of the Association secure information concerning railroad and airplane travel directly from their local ticket agents, who are in a position to give them information regarding train or plane schedules and fares.

International Travel Service, Inc.

A Special A.M.A. Tour Train has been arranged for doctors and their families who plan to attend the convention in Atlantic City in June.

The train leaves Chicago Saturday, June 4, and leaves Atlantic City, Friday, June 10, for New York City, Montreal and Quebec by train and steamer, including the St. Lawrence and Saguenay River trips and motor launch tours of the Thousand Islands, returning to Chicago June 18.

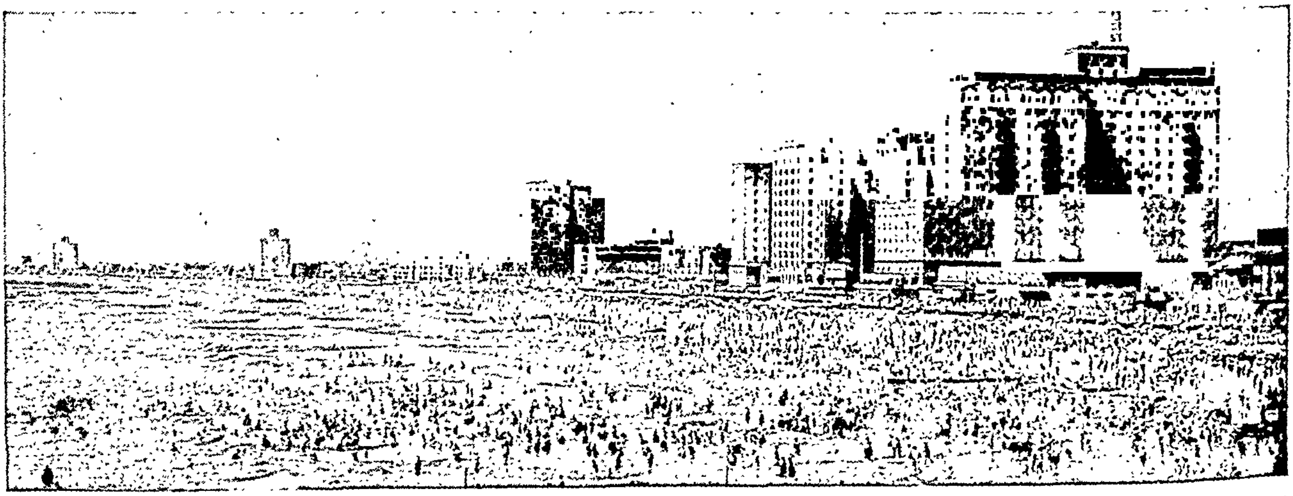
This all-expense trip includes railroad and Pullman as selected, best of hotels, meals, sightseeing, steamer reservations and special arranged programs. This is a de luxe trip, moderately priced from $208. A limited number may join from Atlantic City.

This program is presented by International Travel Service, Inc., Palmer House, Chicago.

Air Travel

The United Air Lines suggests that members fly to Philadelphia on United's Mainliner 300 (DC6), have a limousine or bus meet their plane and take the passengers, with their luggage, directly to their hotel in Atlantic City. The limousine or bus trip takes about two hours. This is the fastest possible service into Atlantic City from the west, except for charter direct.

For further information concerning United Air Lines to Atlantic City in June, please communicate with M. M. Mathews, United Air Lines Building, Chicago 38,



PANORAMA OF THE BOARDWALK IN ATLANTIC CITY, SHOWING BOARDWALK HOTELS THE CONVEN

TELEVISION

UNIVERSITY OF PENNSYLVANIA SCHOOL OF MEDICINE PROGRAM IN COLOR

Sponsored by Smith, Kline and French Laboratories

MONDAY, JUNE 6

A. M.

9:00- 9:10 Introductory Remarks.
I. S. RAVDIN, John Rhea Barton Professor of Surgery, University of Pennsylvania.

9:10-10:00 Appendectomy.
DAVID ALLMAN, Surgical Director, Atlantic City Hospital.

10:00-11:00 Cholecystectomy and Choledochotomy.
I. S. RAVDIN.

11:00-12:00 Gastric Resection.
JONATHAN E. RHOADS, Associate Professor of Surgery, University of Pennsylvania.

12:00-12:30 Clinic—Strictures of the Common Bile Duct.
WALTMAN WALTERS, Professor of Surgery, Graduate School, University of Minnesota at the Mayo Foundation, Rochester, Minn.

P. M.

1:30- 3:30 Pediatric Seminar Conducted by JOSEPH STOKES JR., William H. Bennett Professor of Pediatrics, University of Pennsylvania.

1:30- 2:00 The Diagnosis and Treatment of Meningitis in Children.
LEWIS CORRIELL, Instructor in Pediatrics, University of Pennsylvania.

2:00- 2:20 The Technic of Transfusion and Fluid Administration in Infants.
WALLACE W. MCCRORY, Assistant Instructor in Pediatrics, University of Pennsylvania.

2:20- 2:40 The Adrenocortical Syndrome (Cushing's) in a Four Year Old Boy.
ELIZABETH KIRK ROSE, Assistant Professor of Pediatrics, University of Pennsylvania.
F. H. HARVIE, Associate in Pediatrics, University of Pennsylvania.

2:40- 3:10 Congenital Hemolytic Anemias, Demonstration of Patients.
BENJAMIN DICKSTEIN, Assistant Instructor in Pediatrics, University of Pennsylvania, and IRVING J. WOLMAN, Assistant Professor in Pediatrics, University of Pennsylvania.

3:10- 3:30 Demonstration and Interpretation of Skin Tests in Various Infectious Diseases.
AIMS C. MCGUINNESS, Assistant Professor of Pediatrics, University of Pennsylvania.

3:30- 4:00 Psychiatric Case Presentation and Conference.
KENNETH E. APPEL, Professor of Clinical Psychiatry, University of Pennsylvania, and Staff.

TUESDAY, JUNE 7

A. M.

9:00-10:00 Herniorrhaphy.
JAMES MASON, Chief of Service, Atlantic City Hospital.

10:00-11:00 The Manchester Operation for Uterine Descensus.
FRANKLIN L. PAYNE, William Goodell Professor of Obstetrics and Gynecology, University of Pennsylvania.

11:00-12:00 The Surgical Treatment of Coarctation of the Aorta.
JULIAN JOHNSON, Associate Professor of Surgery, University of Pennsylvania.

12:00-12:30 Clinic—Venous Thrombosis.
ARTHUR ALLEN, Lecturer on Surgery, The Harvard Medical School, Boston.

P. M.

1:30- 2:00 Problems in Heart Disease.
C. C. WOLFERTH, Professor of Medicine, University of Pennsylvania, and Staff.

2:00- 4:00 Medical Clinics.
O. H. PERRY PEPPER, Professor of Medicine, University of Pennsylvania, FRANCIS C. WOOD, Professor of Medicine, and Staff.

WEDNESDAY, JUNE 8

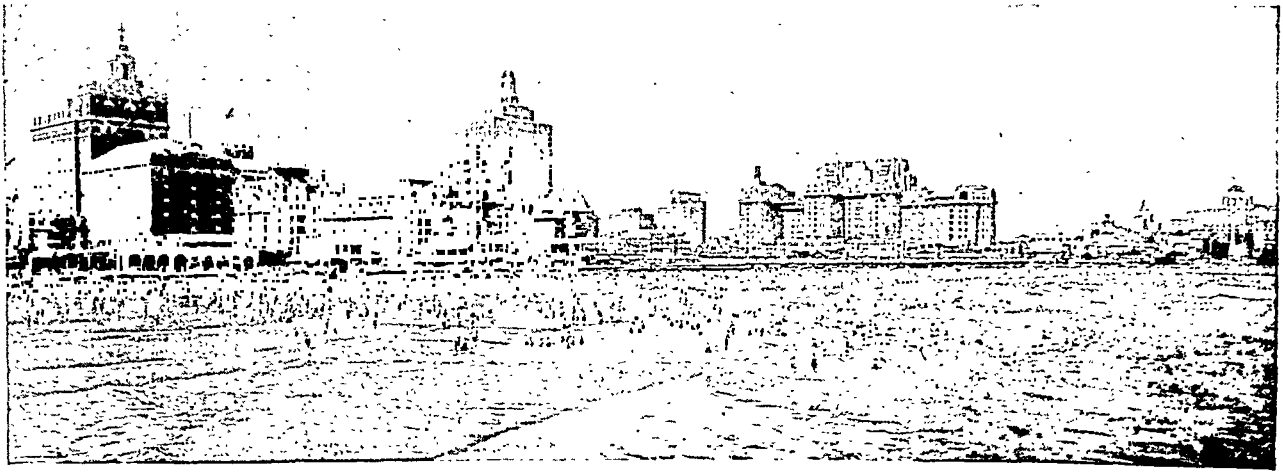
A. M.

9:00-10:00 Caesarean Section.
CARL BACHMAN, Professor of Obstetrics and Gynecology, University of Pennsylvania.

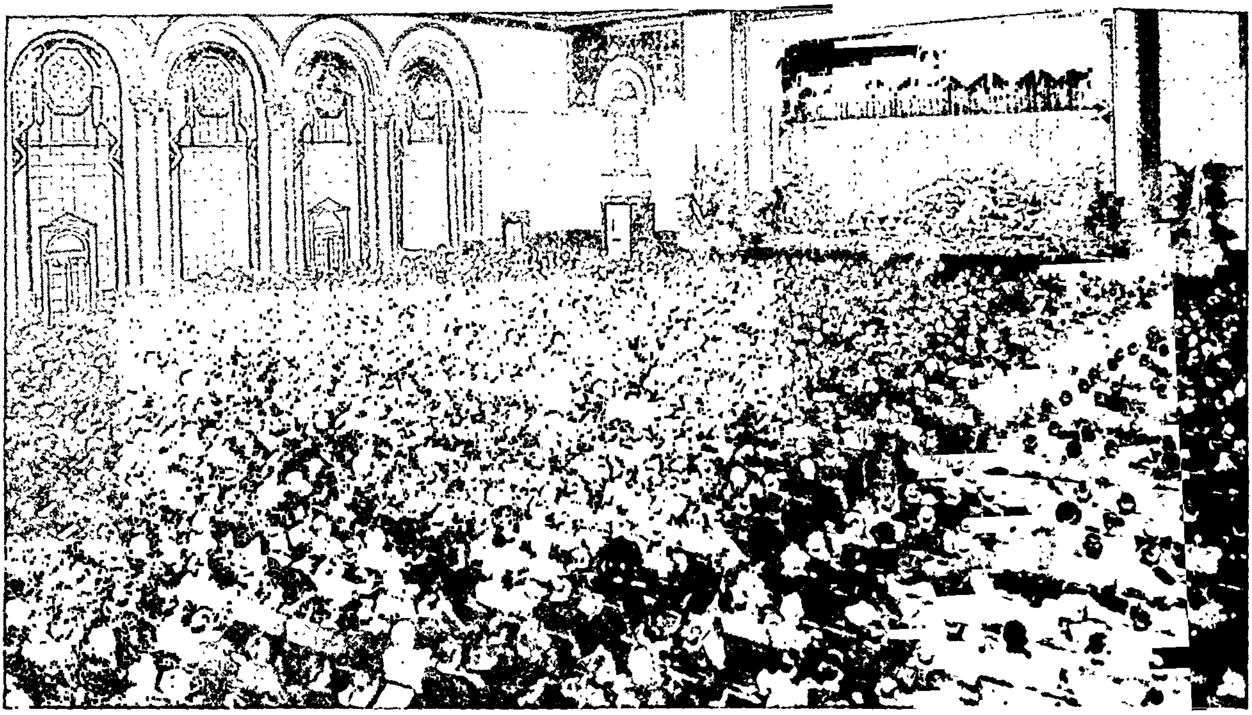
10:00-11:00 Total Hysterectomy.
PAUL O. KLINGENSMITH, Associate in Obstetrics and Gynecology, University of Pennsylvania.

11:00-12:00 Bone Grafting.
PAUL C. COLONNA, Professor of Orthopedic Surgery, University of Pennsylvania.

12:00-12:30 Clinic—The Surgery of Ulcerative Colitis.
HENRY CAVE, Clinical Professor of Surgery, College of Physicians and Surgeons, Columbia University, New York City.



TION AUDITORIUM IS LOCATED AT A CONVENIENT DISTANCE FROM MOST OF THE LARGE HOTELS.



INTERIOR OF THE AUDITORIUM. SCENE OF THE OPENING MEETING AND THE RECEPTION TO THE PRESIDENT.

P. M.

1:30- 2:30 Tumor Conference.

Panel: Chairman, Robert C. Horn, Associate Professor of Surgical Pathology, University of Pennsylvania; I. S. Ravdin; E. P. Pendergrass, Professor of Radiology, University of Pennsylvania; R. H. Chamberlain, Assistant Professor of Radiology, University of Pennsylvania; H. P. Royster, Assistant Professor of Surgery, University of Pennsylvania; H. Beerman, Assistant Professor of Dermatology and Syphilology, University of Pennsylvania; Ralph Jones, Assistant Instructor in Medicine, University of Pennsylvania, and Jeanette M. Shorey, Instructor in Medicine, University of Pennsylvania.

2:30- 2:50 Demonstration of Dermatologic Patients.

Donald M. Pillsbury, Professor of Dermatology and Syphilology, University of Pennsylvania.

2:50- 3:10 Demonstration of Mycologic Methods in Dermatology.

Edward D. Delamater, Research Associate Professor, Department of Dermatology and Syphilology, University of Pennsylvania.

Alfred Kligman, Assistant Instructor in Dermatology and Syphilology, University of Pennsylvania.

3:10- 3:30 Virologic Methods in Dermatology.

G. Douglas Baldridge, Assistant Instructor in Dermatology and Syphilology, University of Pennsylvania.

3:30- 4:00 Subject to be announced.

A. M. Thursday, June 9

9:00-10:00 Prostatectomy.

P. Boland Hughes, Assistant Professor of Urology, University of Pennsylvania.

10:00-11:00 Cranial Trauma.

Francis C. Grant, Professor of Neurosurgery, University of Pennsylvania.

11:00-11:30 Corneal Transplant.

Harold G. Scheie, Assistant Professor of Ophthalmology, University of Pennsylvania.

12:00-12:30 Cancer of the Thyroid.

Clinic: George Crile Jr., Cleveland Clinic.

P. M.

1:30- 2:30 A Demonstration of Some Drug Actions in Various Neurological Disorders.

George D. Gammon, Professor of Clinical Neurology, University of Pennsylvania, and Staff.

2:30- 4:00 The Application of Radioactive Isotopes to Medicine (Demonstration).

Richard H. Chamberlain; Edward W. Chamberlain, Professor of Radiology, Temple University; George C. Henny, Professor of Medical Physics, Temple University; Edith Quimby, Associate Professor of Radiology, Columbia University; Robert Newell, Professor of Radiology, Stanford University; Earl R. Miller, Associate Professor of Radiology, University of California, and Theodore Eberhard, Assistant Professor of Radiology, Jefferson Medical College.

TELEVISION INTERPRETATION OF ROENTGENOGRAMS

Presented by
John S. Garvin, Craig W. Goodwin
and
Roger A. Harvey,
University of Illinois College of Medicine, Chicago

Sponsored by E. R. Squibb and Sons, New York

(Rooms 15 and 16—Second Floor—Convention Hall)

This is a demonstration of viewing roentgenograms by use of a scanning device which functions as a continuously acting densitometer. The electrical output from the scanner is overamplified, and fed into a kinescope as in conventional television. By changing the range and intensity of contrast one can see faint shadows with exactness and clarity. The untrained eye sees objects previously unnoticed, and the roentgenologist can interpret questionable shadows. This permits more exact interpretation and increases the usefulness of roentgenograms. It is applicable to teaching in large lecture halls and operating rooms by exhibiting the details at a distance.

MEETING PLACES

House of Delegates: American Room, Hotel Traymore, Boardwalk at Illinois Avenue.

General Scientific Meetings: Ballroom, Convention Hall.

Inaugural Meeting: Ballroom, Convention Hall.

General Headquarters, Registration Bureau, Scientific Exhibit, Technical Exhibits and Information Bureau: Convention Hall.

SECTIONS OF SCIENTIFIC ASSEMBLY

Internal Medicine: Ballroom, Convention Hall.

Surgery, General and Abdominal: Westminster Hall, Chelsea Hotel, Boardwalk between Morris and Brighton Avenues (Wednesday and Thursday); American Room, Hotel Traymore, Boardwalk at Illinois Avenue (Friday).

Obstetrics and Gynecology: Westminster Hall, Chelsea Hotel, Boardwalk between Morris and Brighton Avenues.

Ophthalmology: Renaissance Room, Ambassador Hotel, Boardwalk at Brighton Avenue.

Laryngology, Otology and Rhinology: Renaissance Room, Ambassador Hotel, Boardwalk at Brighton Avenue (Wednesday and Thursday only).

Pediatrics: Ballroom, Convention Hall.

Experimental Medicine and Therapeutics: Wedgewood Room, Chelsea Hotel, Boardwalk between Morris and Brighton Avenues.

Pathology and Physiology: Wedgewood Room, Chelsea Hotel, Boardwalk between Morris and Brighton Avenues.

Nervous and Mental Diseases: Trellis Room, Ritz-Carlton Hotel, Boardwalk at Iowa Avenue.

Dermatology and Syphilology: Wedgewood Room, Marlborough-Blenheim Hotel, Boardwalk at Ohio Avenue (Wednesday and Thursday only).

Preventive and Industrial Medicine and Public Health: Trellis Room, Ritz-Carlton Hotel, Boardwalk at Iowa Avenue.

Urology: Wedgewood Room, Marlborough-Blenheim Hotel, Boardwalk at Ohio Avenue.

Orthopedic Surgery: St. Dennis Room, Dennis Hotel, Boardwalk at Michigan Avenue.

Gastro-Enterology and Proctology: St. Dennis Room, Dennis Hotel, Boardwalk at Michigan Avenue.

Radiology: Venetian Room, Ambassador Hotel, Boardwalk at Brighton Avenue.

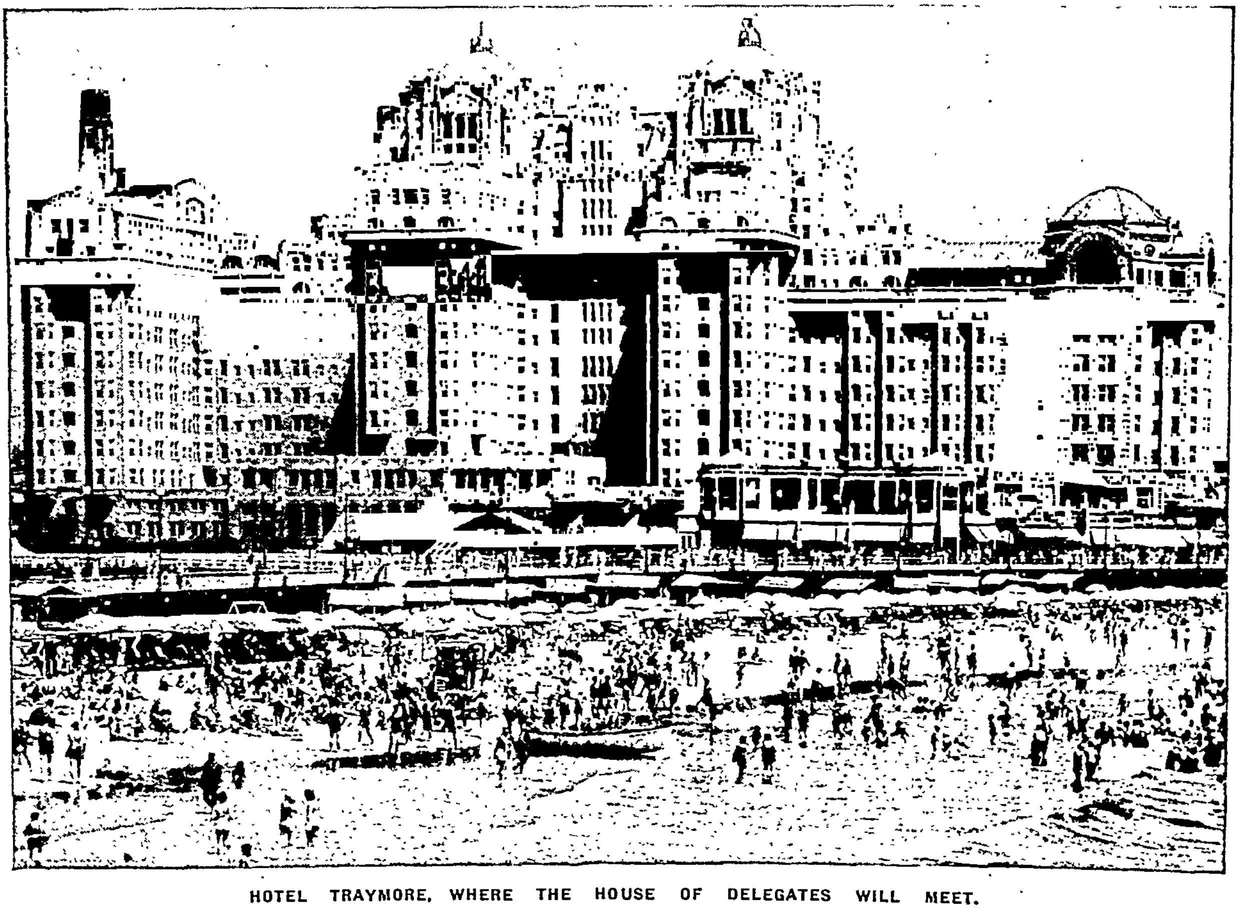
Anesthesiology: Venetian Room, Ambassador Hotel, Boardwalk at Brighton Avenue (Wednesday and Thursday); American Room, Hotel Traymore, Boardwalk at Illinois Avenue (Friday).

General Practice: Trimble Hall, Claridge Hotel, Boardwalk between Indiana and Ohio Avenues.

Diseases of Chest: Trimble Hall, Claridge Hotel, Boardwalk between Indiana and Ohio Avenues (Wednesday and Thursday only).

Miscellaneous Topics: Sessions on Physical Medicine: Ocean Hall, Marlborough-Blenheim Hotel, Boardwalk at Ohio Avenue (Wednesday and Thursday); Session on Allergy: Renaissance Room, Ambassador Hotel, Boardwalk at Brighton Avenue (Friday).

The Convention Hall is located on the Boardwalk between Mississippi and Georgia Avenues.



HOTEL TRAYMORE, WHERE THE HOUSE OF DELEGATES WILL MEET.

Rush Medical College Alumni Association, Dinner, Ritz-Carlton Hotel, Wednesday, June 8, 6:30 p. m.

Stanford University Medical Alumni Association, Luncheon, Ritz-Carlton Hotel, 12:30 p. m.

Theta Kappa Psi, Jefferson Hotel, Wednesday, June 8.

University of Louisville Alumni, Cocktail Party and Buffet Dinner, Wednesday, June 8, Brighton Hotel, 5:30 p. m. Alumni are requested to register at the University of Louisville booth in Convention Hall.

WOMAN'S AUXILIARY

Information

A most cordial invitation is extended to all women who are Auxiliary members, or guests of physicians attending the convention of the American Medical Association, to participate in all social functions and attend the general sessions. Whether Auxiliary members or not, wives of doctors will be most welcome.

Auxiliary headquarters will be on the Lounge Floor of Haddon Hall. All meetings and functions will be held at Haddon Hall unless otherwise stated in the program. Please register early and obtain your badge and program of the social functions.

All tickets should be purchased soon after arrival. Members of the Hospitality and Information Committees will be at the hotels. Committee members will gladly help plan an interesting visit in Atlantic City. Tickets will be sold only at Auxiliary headquarters in Haddon Hall. All meetings and social affairs will begin at the time scheduled. Please be prompt.

Registration Hours

Sunday	12 m.	4 p. m.
Monday	9 a. m.	4 p. m.
Tuesday	9 a. m.	4 p. m.
Wednesday	9 a. m.	4 p. m.
Thursday	9 a. m.	12 m.

Acknowledgments

The Woman's Auxiliary to the American Medical Association is pleased to acknowledge the courtesy and generosity of Wyeth, Incorporated, who provided this program for the Annual Meeting.

For the many courtesies extended to the chairmen of the various committees in preparation for the convention, detailed acknowledgment will be published later.

The General Chairman on Convention Arrangements desires to express her sincere appreciation to the members of the Executive Committee, the chairmen, co-chairmen and members of the Convention Committees, and to Mr. Al Skean and the personnel of the Atlantic City Convention Bureau for their splendid cooperation and generous service.

Mrs. James H. Mason,
General Chairman,
Committee on Convention Arrangements.

Preconvention Meetings

Sunday, June 5

12. m. to 4 p. m.	The members of the Hospitality Committee will welcome members and guests of the Woman's Auxiliary.

COMMITTEE MEETINGS

1 p. m.	Nominating Committee, Rowsley Room (first floor). Mrs. Jesse D. Hamer, Chairman.
8 p. m.	Finance Committee, Bakewell Room (first floor). Mrs. Scott C. Applewhite, Chairman.

Monday, June 6

9:30 a. m.	Board of Directors, Room 134 (first floor). Presiding, Mrs. Luther H. Kice, President.

10 a. m. to 12 m. Round Table Discussions:

Hygeia, Mrs. Aldace W. Hammond, Chairman, Room 1344, (thirteenth floor).

Legislation, Mrs. Charles L. Shafer, Chairman, Lounge Floor Solarium.

Program, Mrs. Harry F. Pohlmann, Chairman, Mandarin Room (thirteenth floor).

Public Relations, Mrs. Asher Yaguda, Chairman, Sun Parlor (lounge floor).

12 m. Luncheon and meeting of Board of Directors, Bakewell Room (first floor).

3 p. m. Revisions Committee, Rowsley Room (first floor). Mrs. Roscoe E. Mosiman, Chairman.

4 p. m. to 6 p. m. Tea honoring Mrs. Luther H. Kice, President, and Mrs. David B. Allman, President-Elect, for the members of the National Board of Directors, State Presidents and President-Elect and guests, Garden Room (lounge floor).

Hostesses: The Woman's Auxiliary to the Medical Society of New Jersey.

8:30 p. m. Fashion Show, Ballroom, Convention Hall.

PROGRAM

Tuesday, June 7

9 a. m.

Formal opening of the Twenty-Sixth Annual Meeting of the Woman's Auxiliary to the American Medical Association, Vernon Room, Lounge Floor.

Presiding..................Mrs. Luther H. Kice, President

Invocation............................Rev. Harvey Bennett
Pastor, First Presbyterian Church

Pledge of Loyalty to the Woman's Auxiliary to the American Medical Association...............Mrs. Eustace A. Allen

Greetings.....Hon. Joseph Altman, Mayor of Atlantic City; Browne Holoman, M.D., Pres., Atlantic County Med. Soc.

Address of Welcome...............Mrs. Robert B. Walker
President, Woman's Auxiliary to the Medical Society of New Jersey

Response.............................Mrs. John S. Bouslog
Past President, Woman's Auxiliary to the Colorado State Medical Society

PHYSICIAN-ARTISTS

If you plan to exhibit at the Atlantic City Exhibition (American Medical Association, June 6-10, 1949) now is the time to write for entry blanks, rules, shipping labels, etc. Haste is necessary because your entries must reach Atlantic City sometime during the period April 15 to May 9. For details, please write air mail to Francis H. Redewill, M.D., Secretary, American Physicians Art Association, Flood Building, San Francisco, Calif.

GOLF TOURNAMENT

The American Medical Golfing Association will hold its thirty-third tournament on Monday, June 6. The nationally famous and beautiful Seaview Country Club at Absecon, N. J., has been reserved for the medical golfers' tournament. Dinner will be served at Seaview at 7 p. m., followed by presentation of the many trophies and prizes.

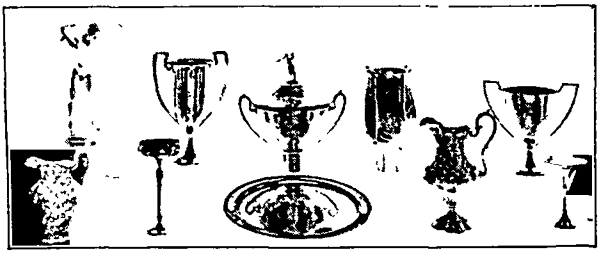
Two Courses

Seaview has two sporty courses, one of eighteen holes located on the edge of the water, called the Bay Course, and the other of nine holes located in a wooded section of the terrain, called the Woods Course. The Bay Course will be utilized by golfers playing only eighteen holes. while both the Bay Course and the Woods Course will test the ability of the thirty-six hole golfers.

Fellows may tee off between 7:30 a. m. and 2 p. m. Luncheon will be served at the club. Entertainment will be held during and after the golfers' banquet at 7 p. m.

Trophies and Prizes

Trophies will be awarded for the Association championship (thirty-six holes), the Will Walter Trophy; to the runner-up champion, the Detroit Trophy; for the eighteen hole championship, the Golden State Trophy; to the runner-up eighteen hole champion, the Ben Thomas Trophy. The Section event will include sterling silver pitchers for such sections as Internal Medicine, Surgery, Gynecology and Obstetrics, Dermatology and Syphilology, General Practice, etc. The first flight (0 to 13) will contain trophies and prizes for both gross and net in thirty-six and eighteen holes, including the St. Louis Trophy, the President's Trophy, the Atlantic City Trophy and the Sperry Trophy. The second and third flights (14 to 18 and 19 to 30) will contain prizes for both thirty-six and eighteen holes; the maturity event (for Fellows 60 years and older), the Minneapolis Trophy, and the Old Guard Championship, the Wendell Phillips Trophy. In addition to these, approximately seventy-five other prizes will be in competition.



Trophies awarded at Recent Annual Tournaments of American Medical Golfing Association

Ten trophies of the American Medical Golfing Association are on permanent display at the American Medical Association headquarters in Chicago.

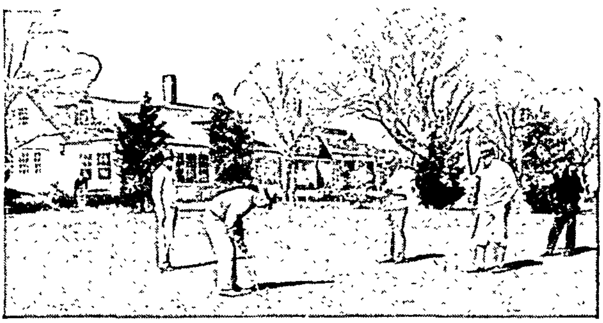
Atlantic City Committee on Arrangements

The Atlantic City Committee on Arrangements is under the Chairmanship of Jean A. Gruhler, 1616 Pacific Avenue, Atlantic City. He is being assisted by Samuel Halpern, A. G. Merendino, Sloan G. Stewart, Baxter H. Timberlake and F. Rolfe Westney, all of Atlantic City, and by D. H. Houston, Seattle, Permanent Chairman of the Advisory Committee.

Applications for Membership

The Atlantic City Tournament will give an opportunity to American Medical Golfing Association Fellows, and to those who join the Association in 1949, to enjoy a wonderful day of golf, to win a nice prize and to join in the famous good fellowship of the American Medical Golfing Association.

All male Fellows of the American Medical Association are cordially invited to become Fellows of the American Medical Golfing Association and execute the application blank at the end of the notice of the Golf Tournament and mail it to Secretary Bill Burns, 2020 Olds Tower, Lansing 8, Mich. Participants in the tournament are required to present their home club handicap, signed by the club secretary—or to accept a handicap set by the American Medical Golfing Association Handicap Committee. No handicap over 30 is allowed. All eighteen hole trophies and prizes are awarded on the basis of scores for the first eighteen holes played. A Fellow absent from the annual banquet following the tournament forfeits his rights to a trophy or prize.



The Atlantic City Golf Club where the Annual Tournament was held in 1947.

Officers of the American Medical Golfing Association

W. C. Speidel, Seattle, is President; C. E. Shannon, Chicago, is President Elect; J. A. Gruhler, Atlantic City, is First Vice President and Director of Handicaps, and I. N. Tucker, New Orleans, is Second Vice President and Director of Arrangements. Waltman Walters, Rochester, Minn., is the most recent addition to the Advisory Committee of Past Presidents.

President Bill Speidel anticipates that approximately two hundred and seventy-five American Medical Golfing Association Fellows will play in the enjoyable Atlantic City Tournament at Seaview Country Club on Monday, June 6.

Mail following application blank to Bill Burns, Secretary, 2020 Olds Tower, Lansing 8, Michigan.

THE PROGRAMS OF THE SECTIONS

Outline of the Scientific Proceedings

The following papers are announced to be read before the various sections. The order here is not necessarily the order that will be followed in the Official Program. The Official Program will be similar to the programs issued in previous years and will contain the final program of each section with abstracts of the papers, as well as lists of committees, program of the Inaugural Meeting, list of entertainments and other information. To prevent misunderstandings and protect the interest of advertisers, it is here announced that this Official Program will contain no advertisements. It is copyrighted by the American Medical Association and will not be distributed before the session. A copy will be given to each Fellow on registration.

SECTION ON INTERNAL MEDICINE

MEETS IN BALLROOM, CONVENTION HALL

OFFICERS OF SECTION

Chairman—M. A. Blankenhorn, Cincinnati.
Vice Chairman—Priscilla White, Boston.
Secretary—Walter L. Palmer, Chicago.
Executive Committee—Joseph T. Wearn, Cleveland; Cecil J. Watson, Minneapolis; M. A. Blankenhorn, Cincinnati.

Wednesday, June 8—9 a. m.

The Diagnostic Value of Cardiac Auscultation. Samuel A. Levine, Boston.
Discussion to be opened by Howard B. Sprague, Boston.

Neurocirculatory Asthenia (Anxiety Neurosis, Effort Syndrome): A Twenty-Year Follow-Up Study of 173 Patients.
E. O. Wheeler, P. D. White, E. W. Reed and M. E. Cohen, Boston.
Discussion to be opened by Arthur M. Master, New York, and Maurice H. Greenhill, Durham, N. C.

The Role of Coronary Vasodilating Drugs in Coronary Occlusion.
N. C. Gilbert, G. K. Fenn and L. A. Nalefski, Chicago.
Discussion to be opened by Roy W. Scott, Cleveland, and W. M. Fowler, Iowa City.

The Frank Billings Lecture: Osler and the American Medical Association. Reginald Fitz, Boston.

Bacteremia Following Tooth Extraction: Prevention with Penicillin and a New Sulfonamide, Gantrisan.
Paul S. Rhoads and Warren R. Schram, Chicago.
Discussion to be opened by Harry F. Dowling, Washington, D. C.

Diagnostic Problems of Prolonged Fever.
Hobart A. Reimann, Philadelphia.
Discussion to be opened by Wesley W. Spink, Minneapolis, and Harold Jeghers, Washington, D. C.

Thursday, June 9—9 a. m.

ELECTION OF OFFICERS

Critique of Reports of the Surgical and Dietary Therapy in Hypertension. David Ayman, Boston.
Discussion to be opened by Frederick M. Allen, New York, and Keith S. Grimson, Durham, N. C.

Hazards in the Use of Low Salt Diets.
Henry A. Schroeder, St. Louis.
Discussion to be opened by J. Edwin Wood Jr., Charlottesville, Va.

Chairman's Address: Deficiency Diseases in a General Hospital; a Ten-Year Study.
M. A. Blankenhorn, Cincinnati.

The Prepsychotic and Early Psychotic Sees the Family Doctor or Internist First.
G. Gill Richards and Louis G. Moench, Salt Lake City.
Discussion to be opened by Milton Rosenbaum, Cincinnati.

Other Factors Beside Allergy in Asthma.
Francis M. Rackemann, Boston.
Discussion to be opened by Simon S. Leopold, Philadelphia.

The Use of Radioactive Isotopes in Clinical Medicine.
John Z. Bowers, Washington, D. C.
Discussion to be opened by Paul C. Aebersold, Oak Ridge, Tenn.

Friday, June 10—9 a. m.

JOINT MEETING WITH SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

The General Management of Rheumatoid Arthritis.
Charles A. Ragan, New York.
Discussion to be opened by Hans Waine, Winchester, Mass.

The Present Status of Gold Therapy in Rheumatoid Arthritis.
Richard H. Freyberg, New York.
Discussion to be opened by Edward F. Rosenberg, Chicago.

Prevention and Treatment of Deformities in Rheumatoid Arthritis.
Donald F. Hill and W. Paul Holbrook, Tucson, Ariz.
Discussion to be opened by Robert L. Preston, New York.

NPH-50 (Modified Protamine) Insulin in the Treatment of Severe Diabetes.
Priscilla White, Boston.
Discussion to be opened by Cyril M. MacBryde, St. Louis, and Henry T. Ricketts, Chicago.

Treatment of Myasthenia Gravis.
Charles T. Stone and J. Alfred Rider, Galveston, Texas.
Discussion to be opened by A. McGehee Harvey, Baltimore.

Favorable Results in Bulbar Poliomyelitis Treated as a Problem in Respiratory Obstruction.
Thomas C. Galloway, Evanston, Ill., and Martin H. Seifert, Wilmette, Ill.
Discussion to be opened by Albert G. Bower, Pasadena, Calif.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

MEETS IN WESTMINSTER HALL, CHELSEA HOTEL

OFFICERS OF SECTION

Chairman—William F. MacFee, New York.
Vice Chairman—Emile Holman, San Francisco.
Secretary—Michael E. DeBakey, Houston, Texas.
Executive Committee—Alton Ochsner, New Orleans; B. Noland Carter, Cincinnati; William F. MacFee, New York.

Wednesday, June 8—2 p. m.

Acute Massive Hemorrhage from the Upper Gastro-Intestinal Tract.
Claude E. Welch, Boston.
Discussion to be opened by John Stewart, Buffalo, and Jonathan E. Rhoads, Philadelphia.

Results of Classical Operations for Duodenal Ulcer and Benign Ulcerating Lesions of the Stomach.
Howard K. Gray, Rochester, Minn.
Discussion to be opened by I. Ridgeway Trimble, Baltimore, and Harold D. Harvey, New York.

Changing Concepts in the Use of Colostomy.
D. Henry Poer, Atlanta, Ga.
Discussion to be opened by Claude E. Welch, Boston, and Fred W. Rankin, Lexington, Ky.

Acute Pancreatitis.
Vinton E. Siler, Cincinnati.
Discussion to be opened by I. Mims Gage, New Orleans, and Robert Elman, St. Louis.

Sterilization of the Intestinal Tract by Antibiotics and Supplemental Agents.
Major Edwin J. Pulaski, Medical Corps, U. S. A.; Lieut. James F. Connell, Medical Corps, U. S. A., and Col. Sam Seeley, Medical Corps, U. S. A.
Discussion to be opened by John S. Lockwood, New York, and Edgar J. Poth, Galveston, Texas.

Some Common Fallacies and Confusions with Regard to Inguinal Hernia Repair.
Amos R. Koontz, Baltimore.
Discussion to be opened by Carrington Williams, Richmond, Va., and Bradley L. Coley, New York.

Thursday, June 9—2 p. m.

ELECTION OF OFFICERS

Chairman's Address: Painless Jaundice.
William F. MacFee, New York.

Craniocerebral Trauma.
R. Glen Spurling and Ludwig H. Segerberg, Louisville, Ky.
Discussion to be opened by Barnes Woodhall, Durham, N. C., and Winchell McK. Craig, Rochester, Minn.

The Present Status of Anticoagulant Therapy in Surgery.
Geza de Takats, Chicago.
Discussion to be opened by Dan C. Elkin, Atlanta, Ga., and Walter F. Kvale, Rochester, Minn.

Acute Changes in Renal Function Associated with Major Surgical Procedures.
Carl A. Moyer, Dallas, Texas.
Discussion to be opened by Charles H. Burnett, Boston, and Ernest E. Muirhead, Dallas, Texas.

Adaptation of Supportive Therapy to the Needs of the Surgical Patient.
Francis D. Moore, Boston.
Discussion to be opened by Everett I. Evans, Richmond, Va., and Carl A. Moyer, Dallas, Texas.

Friday, June 10—9 a. m.

JOINT MEETING WITH SECTION ON ANESTHESIOLOGY IN AMERICAN ROOM, HOTEL TRAYMORE

Preliminary Report of the Committee on Operative Mortality.
Frederick P. Haugen, Portland, Ore.
Discussion to be opened by H. K. Beecher, Boston, and Ambrose H. Storck, New Orleans.

Management of Pain.
F. A. D. Alexander, McKinney, Texas, and T. McD. Anderson, Dallas, Texas.
Discussion to be opened by Henry S. Ruth, Haverford, Pa., and James C. White, Boston.

Cyclopropane Anesthesia.
L. H. Mousel, Washington, D. C.
Discussion to be opened by R. D. Dripps, Philadelphia, and Frank B. Berry, New York.

Cardiac Arrest During Anesthesia and Surgery.
Claude S. Beck and H. J. Rand, Cleveland.
Discussion to be opened by T. J. Dry, Rochester, Minn., and Frank H. Lahey, Boston.

Anesthesia in Thoracic Surgery.
John C. Jones, Los Angeles.
Discussion to be opened by Charles F. McCuskey, Los Angeles, and Victor Richards, San Francisco.

Anesthesia in Infants and Young Children for Major Surgical Procedures.
C. R. Stephen, Montreal, Canada.
Discussion to be opened by Curtiss B. Hickcox, Hartford, Conn., and Edward J. Donovan, New York.

SECTION ON OBSTETRICS AND GYNECOLOGY

MEETS IN WESTMINSTER HALL, CHELSEA HOTEL

OFFICERS OF SECTION

Chairman—Leroy A. Calkins, Kansas City, Kans.
Vice Chairman—Herbert E. Schmitz, Chicago.
Secretary—Arthur B. Hunt, Rochester, Minn.
Executive Committee—Alice F. Maxwell, San Francisco; William F. Mengert, Dallas, Texas; Leroy A. Calkins, Kansas City, Kans.

Wednesday, June 8—9 a. m.

Rheumatic Heart Disease in Pregnancy.
Joseph J. Bunim, New York.
Discussion to be opened by Julius Jensen, St. Louis; Burton E. Hamilton, Boston, and Nicholson J. Eastman, Baltimore.

Evaluation of Present Day Trends Pertaining to Personality and Psychologic Aspects of Pregnancy.
Duncan E. Reid, Boston.
Discussion to be opened by Sprague H. Gardiner, Indianapolis, and Gordon R. Kamman, St. Paul.

The Conservative Treatment of Premature Separation of the Normally Implanted Placenta.
John R. McCain and Samuel R. Poliakoff, Atlanta, Ga.
Discussion to be opened by M. Peirce Rucker, Richmond, Va.; C. O. McCormick, Indianapolis, and Edward G. Waters, Jersey City, N. J.

The Reproductive Careers of Women Who Have Menstrual Dysfunctions.
Lois A. Day and Philip L. Smith, Rochester, Minn.
Discussion to be opened by Jean Paul Pratt, Detroit, and S. Leon Israel, Philadelphia.

Newer Methods in the Management of Infertility.
G. E. Seegar Jones, Baltimore.
Discussion to be opened by J. P. Greenhill, Chicago, and John Rock, Brookline, Mass.

Steroid Therapy in Early Pregnancy Complications.
M. Edward Davis, Chicago.
Discussion to be opened by Olive W. Smith, Brookline, Mass.; A. E. Rakoff, Philadelphia, and A. R. Abarbanel, Los Angeles.

Thursday, June 9—9 a. m.

ELECTION OF OFFICERS

Chairman's Address: Reproduction in the Older Woman.
Leroy A. Calkins, Kansas City, Kans.

A New Simplified Classification of the Pelvis.
H. Robert Berman, Newark, N. J.

Secretary—Margaret Mary Nicholson, Washington, D. C.
Executive Committee—Gilbert J. Levy, Memphis, Tenn.; Oscar Reiss,* Los Angeles; Woodruff L. Crawford, Rockford, Ill.

Wednesday, June 8—2 p. m.

Treatment of Acute Rheumatic Fever and Prevention of Recurrences.
Robert L. Jackson, Iowa City.
Discussion to be opened by William Weston Jr., Columbia, S. C.; John P. Hubbard, Philadelphia, and May G. Wilson, New York.

The Treatment of Infection with New Antibiotics.
Perrin H. Long, Emanuel B. Schoenbach, Morton S. Bryer, Caroline A. Chandler and Eleanor A. Bliss, Baltimore.
Discussion to be opened by Vernon Knight, New York, and Robert B. Lawson, Winston-Salem, N. C.

"3-Day Fever": An Endemic Febrile Disease of Childhood, with Virus Studies.
Clarence H. Webb, Shreveport, La.; S. George Wolfe, New York, and Beatrice F. Howitt, Montgomery, Ala.
Discussion to be opened by Joseph E. Smadel, Washington, D. C.; Thomas F. McNair Scott, Philadelphia, and Kari Penttinen, Helsinki, Finland.

Acute Conjunctivitis Caused by Hemophilus
Dorland J. Davis and Margaret Pittman, Bethesda, Md.
Discussion to be opened by James C. Overall, Nashville, Tenn; Samiye Argut, Ankara, Turkey; Thomas D. Allen, Chicago, and Alson E. Braley, New York.

Congenital Obstruction of the Alimentary Tract.
John P. Caffey, New York.
Discussion to be opened by Orvar Swenson, Boston; Mercer Blanchard, Columbus, Ga., and McLenmore Birdsong, Charlottesville, Va.

Congenital Dislocation of the Hip Joint: Early Recognition and Prevention.
Vernon L. Hart, Minneapolis.
Discussion to be opened by Russell C. Bond, Wheeling, W. Va.; Mayer S. DeRoy, Pittsburgh; Esperanza Oteo de Hoogh, México D. F., Mexico, and Willis H. Thompson, Minneapolis.

Thursday, June 9—2 p. m.

ELECTION OF OFFICERS

SYMPOSIUM ON CONGENITAL HEART DISEASE

Congenital Heart Disease from the Pediatric View.
Stanley Gibson, Chicago.

Common Cardiac Defects Which Can Be Treated by Surgery: Discussed from Standpoint of Functional Pathology.
Jesse E. Edwards, Rochester, Minn.

The Clinical Syndromes of the Tetralogy of Fallot.
Helen B. Taussig, Baltimore.

Problems Encountered in Surgical Treatment of Patients with Coarctation of the Aorta.
Alfred Blalock, Baltimore.
Discussion to be opened by John C. Jones, Los Angeles.

Angiocardiographic Examples.
John D. Keith, Toronto, Canada.

Friday, June 10—2 p. m.

Medical Implications and Applications of Radioisotopes.
George M. Lyon, Alexandria, Va.
Discussion to be opened by Malcolm W. Mason and Fred R. Lang, Bethesda, Md.

* Deceased.

Factors Responsible for Laryngeal Obstruction in Infants. Paul H. Holinger, Chicago.
Discussion to be opened by Louis H. Clerf and Waldo E. Nelson, Philadelphia, and E. Clarence Rice, Washington, D. C.

Asphyxia of the Newborn. Wyman C. C. Cole, Detroit.
Discussion to be opened by Stewart H. Clifford, Brookline, Mass.; William F. O'Donnell, Washington, D. C., and James B. Stone, Richmond, Va.

Evils of Thumb Sucking. Charles Hendee Smith, New York.
Discussion to be opened by Julio Periera, La Paz, Bolivia; Henry H. Work Jr., Arlington, Va., and Argimiro Brachamonte, Berquisimeto, Venezuela.

Breast Feeding Comes of Age. Frank Howard Richardson, Asheville, N. C.
Discussion to be opened by Alicia Gallaga Romero, México, D. F., Mexico, and M. Hines Roberts, Atlanta, Ga.

Chemotherapy of Childhood Cancer Including Leukemia. Sidney Farber, Boston.
Discussion to be opened by Murray Schear, Bethesda, Md.; Lewis Katz Alpert, Washington, D. C.; Roswell D. Johnson, New Orleans; S. D. Mills, Rochester, Minn., and Oscar Brentwood Hunter Jr., Washington, D. C.

SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

MEETS IN WEDGEWOOD ROOM OF CHELSEA HOTEL

OFFICERS OF SECTION

Chairman—Dwight L. Wilbur, San Francisco.
Vice Chairman—McKeen Cattell, New York.
Secretary—Carl V. Moore, St. Louis.
Executive Committee—Carl A. Dragstedt, Chicago; Walter Bauer, Boston; Dwight L. Wilbur, San Francisco.

Wednesday, June 8—2 p. m.

SYMPOSIUM ON CHEMOTHERAPY AND INFECTIOUS DISEASE

Dosage Forms of Penicillin. Chester S. Keefer, Boston.

The Relation of Streptomycin Dosage to Toxicity and to Emergence of Resistant Organisms. Walsh McDermott, New York.

Aureomycin. Wesley W. Spink, Minneapolis.
Discussion to be opened by Perrin H. Long, Baltimore.

Clinical Use of the New Antibiotic Chloromycetin. Joseph E. Smadel, Washington, D. C.

The Status of Research on the Common Cold. Norman H. Topping, Bethesda, Md.

Serum Prophylaxis After Exposure to Rabies. Hilary Koprowski, Pearl River, N. Y.

Thursday, June 9—2 p. m.

ELECTION OF OFFICERS

Chairman's Address: The Clinical Management of the Patient with Fatigue and Nervousness. Dwight L. Wilbur, San Francisco.

The Treatment of Addisonian Pernicious Anemia with Vitamin B_{12}. Randolph West, New York.
Discussion to be opened by William J. Darby, Nashville, Tenn., and Byron E. Hall, Rochester, Minn.

Chemotherapy of Malignant Neoplastic Disease. Edward H. Reinhard and James T. Good, St. Louis, and Edward Martin, New Britain, Conn.
Discussion to be opened by J. M. Stickney, Rochester, Minn.

Some Observations on Digitoxin and Other Glycosides of the Digitalis Series. Harry Gold, New York.
Discussion to be opened by Harold E. B. Pardee, New York.

Clinical and Experimental Use of Lithium Salts as a Seasoning Substitute for Lithium Chloride. John H. Talbott, Buffalo.
Discussion to be opened by Henry A. Schroeder, St. Louis.

Modern Treatment of Diabetes with Special Reference to the Use of New Modified Protamine Insulin. Cyril M. MacBryde, St. Louis.

Friday, June 10—9 a. m.

JOINT MEETING WITH SECTION ON INTERNAL MEDICINE IN BALLROOM, CONVENTION HALL

The General Management of Rheumatoid Arthritis. Charles A. Ragan, New York.
Discussion to be opened by Hans Waine, Winchester, Mass.

The Present Status of Gold Therapy in Rheumatoid Arthritis. Richard H. Freyberg, New York.
Discussion to be opened by Edward F. Rosenberg, Chicago.

Prevention and Treatment of Deformities in Rheumatoid Arthritis. Donald F. Hill and W. Paul Holbrook, Tucson, Ariz.
Discussion to be opened by Robert L. Preston, New York.

NPH-50 (Modified Protamine) Insulin in the Treatment of Severe Diabetes. Priscilla White, Boston.
Discussion to be opened by Cyril W. MacBryde, St. Louis, and Henry T. Ricketts, Chicago.

Treatment of Myasthenia Gravis. Charles T. Stone and J. Alfred Rider, Galveston, Texas.
Discussion to be opened by A. McGehee Harvey, Baltimore.

Favorable Results in Bulbar Poliomyelitis Treated as a Problem in Respiratory Obstruction. Thomas C. Galloway, Evanston, Ill., and Martin H. Seifert, Wilmette, Ill.
Discussion to be opened by Albert G. Bower, Pasadena, Calif.

SECTION ON PATHOLOGY AND PHYSIOLOGY

MEETS IN WEDGEWOOD ROOM OF CHELSEA HOTEL

OFFICERS OF SECTION

Chairman—George E. Wakerlin, Chicago.
Vice Chairman—Frank W. Konzelmann, Atlantic City, N. J.
Secretary—Edwin F. Hirsch, Chicago.
Executive Committee—J. J. Moore, Chicago; Alvin G. Foord, Pasadena, Calif.; George E. Wakerlin, Chicago.

Wednesday, June 8—9 a. m.

The Pathologic Physiology of the Spleen. Charles A. Doan, Columbus, Ohio.

The Psysiopathology and Course of Polycythemia Vera. William Dameshek, Boston.

Recent Advances in the Physiology of Respiration with Particular Reference to Oxygen Therapy. Julius H. Comroe Jr., Philadelphia.

Clinical and Physiologic Concepts of the Psychoneuroses. I. Arthur Mirsky, Cincinnati.

Thursday, June 9—9 a. m.

ELECTION OF OFFICERS

Chairman's Address. George E. Wakerlin, Chicago.

Demonstration of Expulsion Factor for Leukocytes. Bernard Steinberg, Toledo, Ohio.

The Pathology and Physiology of Acute Coronary Insufficiency.
Henry Horn and Leonard E. Field, New York.

The Histopathologic Diagnosis of Rhinosceroma.
H. Russell Fisher, Los Angeles.

Cardiac Lesions in Rheumatoid Arthritis.
Irving Graef, New York.

Friday, June 10—9 a. m.

JOINT MEETING WITH SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

Acute and Chronic Pancreatitis. A. C. Ivy, Chicago.
Discussion to be opened by Sara M. Jordan and Sidney Farber, Boston.

Chronic Ulcerative Colitis: Proctoscopic Appearance.
J. Peerman Nesselrod, Evanston, Ill., and Jay M. Garner, Winnetka, Ill.
Discussion to opened by J. A. Bargen, Rochester, Minn., and Sidney A. Portas, Chicago

Early Detection of Carcinoma of the Stomach.
David State, Minneapolis.
Discussion to be opened by Russell H. Morgan, Baltimore, and Alexander Brunschweig, New York.

The Value of Gastric Biopsy as Obtained Through the Flexible Operating Gastroscope.
Edward B. Benedict, Boston.
Discussion to be opened by H. J. Moersch, Rochester, Minn., and Cecil O. Patterson, Dallas, Texas.

Diagnostic Problems in Jaundice.
Franklin M. Hanger, New York.
Discussion to be opened by Richard B. Capps, Chicago, and John R. Neefe, Philadelphia.

SECTION ON NERVOUS AND MENTAL DISEASES

MEETS IN TRELLIS ROOM, RITZ-CARLTON HOTEL

OFFICERS OF SECTION

Chairman—Francis J. Gerty, Chicago.
Vice Chairman—Luman Daniels, Denver.
Secretary—Francis M. Forster, Philadelphia.
Executive Committee—Roland P. Mackay, Chicago; A. R. Vonderahe, Cincinnati; Francis J. Gerty, Chicago.

Wednesday, June 8—2 p. m.

Spontaneous Nontraumatic Subdural Hematomas.
Michael Scott, Philadelphia.
Discussion to be opened by J. Rudolph Jaeger, Philadelphia, and Tracy J. Putnam, Beverly Hills, Calif.

The Place of Neurologic Surgery in the Treatment of Epilepsy. A. Earl Walker, Baltimore.
Discussion to be opened by Percival Bailey, Chicago, and John E. Scarff, New York.

A Clinical Method for Measurement of Internal Carotid Pressure: Significance of Changes During Carotid Occlusion.
William H. Sweet and Stanley J. Sarnoff, Boston.
Discussion to be opened by Henry A. Shenkin, Philadelphia, and Sidney W. Gross, New York.

Arnold-Chiari Malformation in Adults.
W. James Gardner, Cleveland.
Discussion to be opened by Ben W. Lichtenstein, Chicago, and Jerome F. Grunnagle, Pittsburgh.

The Effect of Head Posture on C. S. F. Manometrics in Cervical Lesions: A New Diagnostic Test.
Lawrence I. Kaplan and Foster Kennedy, New York.
Discussion to be opened by Luman E. Daniels, Denver, and Francis C. Grant, Philadelphia.

Localizing Cerebellar Syndromes.
Joe R. Brown, Minneapolis.
Discussion to be opened by Gervase J. Connor, New Haven, Conn., and Benjamin H. Balser, New York.

Thursday, June 9—2 p. m.

ELECTION OF OFFICERS

Chairman's Address: Psychiatry; Its Scope and Relationship in Medicine. Francis J. Gerty, Chicago.

Treatment of Neurosyphilis with Penicillin.
Douglas Goldman, Cincinnati.
Discussion to be opened by George D. Gammon and John H. Stokes, Philadelphia.

Evaluation of Artane in the Treatment of Parkinsonism.
K. B. Corbin, Rochester, Minn.
Discussion to be opened by Peter G. Denker, New York, and Roland P. Mackay, Chicago.

The Psychiatric Manifestations of Certain Convulsive States. Richard L. Masland, Winston-Salem, N. C.
Discussion to be opened by Herbert Jasper, Montreal, Canada, and Calvin S. Drayer, Philadelphia.

Mesantoin and Combined Therapy in Epilepsy: A Three Year Study. Joseph L. Fetterman, Cleveland.
Discussion to be opened by H. Houston Merritt, New York, and Bernard J. Alpers, Philadelphia.

Retraining Therapy in Neurologic Diseases.
Andrew J. Leemhuis, Minneapolis.
Discussion to be opened by Pearce Bailey, Washington, D. C., and Hans H. Reese, Madison, Wis.

Friday, June 10—2 p. m.

The Outlook of Patients Over 65 Years of Age Hospitalized for the First Time in a State Institution for the Mentally Ill.
Herbert A. Perry, Medical Lake, Wash.
Discussion to be opened by Robert S. Bookhammer, Philadelphia, and Mesrop A. Tarumianz, Farnhurst, Del.

Clinical Aspects of Hysteria: A Study of 100 Cases and 100 Control Subjects.
James Purtell, Milwaukee, and Eli Robbins, Boston.
Discussion to be opened by Charles Rupp, Philadelphia, and Frederick C. Redlich, New Haven, Conn.

Ictal and Nonictal Psychiatric Disorder in Temporal Lobe Epilepsy. Frederick A. Gibbs, Chicago.
Discussion to be opened by Percival Bailey, Chicago, and Richard L. Masland, Winston-Salem, N. C.

Theoretical Aspects of Prefrontal Lobotomy and Similar Operations. Paul H. Hoch, New York.
Discussion to be opened by A. R. Vonderahe, Cincinnati, and Walter Freeman, Washington, D. C.

Practical Considerations in the Treatment of Mentally Ill.
Irving J. Sands, New York.
Discussion to be opened by George N. Raines, Bethesda, Md., and Joseph C. Yaskin, Philadelphia.

Intravenous Pentathol in the Treatment of Alcoholism.
Frederick Lemere and Paul O'Hollaren, Seattle.
Discussion to be opened by Robert V. Seliger, Baltimore, and Howard P. Rome, Rochester, Minn.

SECTION ON DERMATOLOGY AND SYPHILOLOGY

MEETS IN WEDGEWOOD ROOM OF MARLBOROUGH BLENHEIM HOTEL

OFFICERS OF SECTION

Chairman—Anthony C. Cipollaro, New York.
Vice Chairman—Michael H. Ebert, Chicago.
Secretary—Clinton W. Lane, St. Louis.
Executive Committee—Nelson Paul Anderson, Los Angeles; Henry E. Michelson, Minneapolis; Anthony C. Cipollaro, New York.

Wednesday, June 8—2 p. m.

Chairman's Address: Dermatology and Syphilology in a Modern Medical Program.
Anthony C. Cipollaro, New York.

Protein Deficiency in Subcutaneous Disease.
W. H. Guy, F. M. Jacob and W. B. Guy, Pittsburgh.
Discussion to be opened by F. J. Eichenlaub, Washington, D. C.

Malingering, Industrial Aspects. J. G. Downing, Boston.
Discussion to be opened by J. W. Jordon, Buffalo.

The Dermatologic Aspects of Insect Repellents and Intoxicants. Leon Goldman, Cincinnati.
Discussion to be opened by Theodore Cornbleet, Chicago.

A Comparative Analysis of the Muco-Cutaneous and Ocular Syndromes. H. M. Robinson Jr., Baltimore.
Discussion to be opened by Helen O. Curth, New York.

Dermatoses of the Colored Race.
V. M. Henington, Frederick Grieshaber and J. K. Howles, New Orleans.
Discussion to be opened by T. W. Murrell Jr., Richmond, Va.

Thursday, June 9—2 p. m.

ELECTION OF OFFICERS

The Distinguished Lecture in Dermatology: The Development of Standards in Dermatology.
C. Guy Lane, Boston.

Rickettsialpox. L. P. Barker, New York.
Discussion to be opened by Nelson Paul Anderson, Los Angeles.

Quantitative Measurements of Activity of Various Antihistamine Drugs Using Histamine Iontophoresis in Human Subjects.
T. H. Sternberg, D. J. Perry and Paul LeVan, Los Angeles.
Discussion to be opened by D. M. Pillsbury, Philadelphia.

Antihistamine Therapy in Dermatology.
G. M. Lewis, New York.
Discussion to be opened by D. M. Ruch, Milwaukee.

The Benign Pigmented Epithelial Nevus.
E. F. Traub, New York.
Discussion to be opened by W. M. Sams, Miami, Fla.

Spindle Cell Epidermoid Carcinoma.
M. J. Strauss, New Haven.
Discussion to be opened by M. D. Marcus, St. Louis.

Misplaced Mongolian Spot.
H. N. Cole Jr., Cleveland, and W. R. Hubler, Corpus Christi, Texas.
Discussion to be opened by S. R. Mercer, Fort Wayne, Ind.

SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

MEETS IN TRELLIS ROOM, RITZ-CARLTON HOTEL

OFFICERS OF SECTION

Chairman—Oscar A. Sander, Milwaukee.
Vice Chairman—C. N. Neupert, Madison, Wis.
Secretary—Rutherford T. Johnstone, Los Angeles.
Executive Committee—Claence O. Sappington, Chicago; Robert H. Riley, Baltimore; Oscar A. Sander, Milwaukee.

Wednesday, June 8—9 a. m.

SYMPOSIUM ON AIR POLLUTION (SMOG)

Prefacing Remarks: Of universal concern to the populace as well as to industry is the effect of smog on community health and property. Much has been written in lay journals which is erroneous but which has led to unfounded fear and agitation. While it is true that engineers and administrative officers have discussed the problem among themselves, too little of the known facts have been presented before city health officers, industrial physicians, and the general practitioners who must answer questions daily asked them regarding the noxiousness or innocuousness of air pollution. The purpose of this symposium is to bring to focus the latest factual data, to eradicate erroneous opinion and to offer a guide to future planning.

R. T. Johnstone, Secretary.

The Aspects of Smog: (a) Chemical; (b) Topographic; (c) Meteorologic. H. F. Johnstone, Urbana, Ill.

Recent Advances in the Identification of Air Pollutants.
J. A. Haagen-Smit, Pasadena, Calif.

Causes, Constituents and Physical Effects of Smog Involved in Specific, Dramatic Episodes (Donora; Meuse River Valley).
H. H. Schrenk, Bethesda, Md.

Approved Control Measures.
W. C. L. Hemeon, Pittsburgh.

Administration of an Air Pollution Control Program.
L. C. McCabe, Los Angeles.

Summary and Discussion of Papers, with Particular Relationship to Community Health.
Robert A. Kehoe, Cincinnati.

Thursday, June 9—9 a. m.

ELECTION OF OFFICERS

Chairman's Address: The General Aspects of Pneumoconiosis. Oscar A. Sander, Milwaukee.

The Piezoelectric Theory of Silicosis.
Silas M. Evans, Milwaukee.

Anthracosilicosis: Clinical and Pathologic Aspects.
H. A. Slesinger, Windber, Pa.

Pulmonary Functional Impairment in Anthracosilicosis.
Hurley Motley, Burgess Gordon, Leonard P. Lang and Peter A. Theodos, Philadelphia.

Disability Evaluation in Occupational Pulmonary Disease.
George A. Wright, Saranac, N. Y.
Discussion of papers of Drs. Motley, Gordon, Lang and Theodos and Dr. Wright to be opened by William S. McCann, Rochester, N. Y.

Friday, June 10—9 a. m.

Why School Health Service?
George M. Wheatley, New York.

Federal Health Services: Recommendations of the Hoover Commission. Hugh R. Leavell, Boston.

The Family Doctor: An Epidemiologic Concept.
Thomas Francis Jr., Ann Arbor, Mich.

Address. Leonard A. Scheele, Washington, D. C.

The Exact Diagnosis of Pulmonary Tuberculosis.
Herman E. Hilleboe, Albany, N. Y.

SECTION ON UROLOGY

MEETS IN WEDGEWOOD ROOM OF MARLBOROUGH-BLENHEIM HOTEL

OFFICERS OF SECTION

Chairman—Hamilton W. McKay, Charlotte, N. C.
Vice Chairman—Norris J. Heckel, Chicago.
Secretary—Edward N. Cook, Rochester, Minn.
Executive Committee—Grayson Carroll, St. Louis; Reed M. Nesbit, Ann Arbor, Mich.; Hamilton W. McKay, Charlotte, N. C.

Wednesday, June 8—9 a. m.

Leukoplakia of the Renal Pelvis.
Lowrain E. McCrea, Philadelphia.

Papillary Necrosis of the Kidney: A Clinical and Experimental Correlation. E. E. Muirhead, Dallas, Texas

Observations of the Electrolyte Pattern of the Blood Following Bilateral Uretero-Intestinal Anastomosis. D. O. Ferris and H. M. Odel, Rochester, Minn.
Discussion on papers of Dr. McCrea, Dr. Muirhead and Drs. Ferris and Odel to be opened by Hugh J. Jewett, Baltimore, and Victor F. Marshall, New York.

Urinary Tract Calculi in Recumbent Patients.
James C. Kimbrough and Joseph C. Denslow, Washington, D. C.

Radioactive Urine and Urinary Tract Calculi.
David S. Cristol, Philadelphia.
Discussion on papers of Drs. Kimbrough and Denslow and Dr. Cristol to be opened by Rubin Flocks, Iowa City, and John F. McCuskey, Clarksburg, W. Va.

Gantrosan (NU-445): An in Vitro and in Vivo Study in Urinary Infections. Grayson Carroll, St. Louis.

The Effect of Streptomycin on the Ureter.
J. Robert Rinker, Augusta, Ga.
Discussion on papers of Drs. Carroll and Rinker to be opened by Albert M. Crance, Geneva, N. Y., and William M. Coppridge, Durham, N. C.

Thursday, June 9—9 a. m.

ELECTION OF OFFICERS.

Excretory Urography Versus Retrograde Urography: Their Respective Advantages and Indications, with Illustrated Cases.
J. Byron Beare and Carl A. Wattenberg, St. Louis.

Significant Scrotal Swellings.
R. Theodore Bergman, Los Angeles.
Discussion on papers of Drs. Beare and Wattenberg and Dr. Bergman to be opened by William A. Milner, Albany, N. Y., and Carroll C. Hyde, South Bend, Ind.

Physiologic and Chemical Changes Associated with Hyperfunctioning Tumors of the Suprarenal Cortex.
Waltman Walters and Randall G. Sprague, Rochester, Minn.
Discussion to be opened by George F. Cahill, New York, and Austin I. Dodson, Richmond, Va.

Chairman's Address. Hamilton W. McKay, Charlotte, N. C.

Analysis of the Treatment of Bladder Tumors.
W. Calhoun Stirling and J. E. Ash, Washington, D. C.

Papillomata of the Bladder.
Herman L. Kretschmer and Edward A. Stika, Chicago.

Vesical Neoplasms of the Female Bladder: A Suggested Surgical Technic. J. Sydney Ritter, New York.
Discussion on papers of Drs. Stirling and Ash, Drs. Kretschmer and Stika and Dr. Ritter to be opened by Ernest Rupel, Indianapolis, and Thomas J. Kirwin, New York.

Friday, June 10—9 a. m.

PANEL DISCUSSION

Prostatic Cancer: Further Investigation of Hormonal Relationships.
Herbert Brendler, W. E. Chase and William W. Scott, Baltimore.

Carcinoma of the Prostate Gland: Results with Conservative Management.
Lloyd R. Reynolds, Thomas L. Schulte and Howard J. Hammer, San Francisco.

Carcinoma of the Prostate: Review of 150 Cases.
William Baurys, Sayre, Pa.
Discussion on papers of Drs. Brendler, Chase and Scott, Drs. Reynolds, Schulte and Hammer and Dr. Baurys to be opened by Reed M. Nesbit, Ann Arbor, Mich., and S. W. Mulholland, Philadelphia.

Postoperative Urinary Incontinence.
Edwin Davis, Omaha.

The Technic for Immediate Diagnosis and Management of Vesical or Urethral Perforations in the Course of Transurethral Procedures.
Herbert R. Kenyon, New York.

Problems Associated with Transurethral Relief of Bladder Neck Obstruction.
John H. Dougherty, Knoxville, Tenn.
Discussion on papers of Drs. Davis, Kenyon and Dougherty to be opened by Wallace L. Bazemore, Macon, Ga., and Richard Chute, Boston.

SECTION ON ORTHOPEDIC SURGERY

MEETS IN ST. DENNIS ROOM OF DENNIS HOTEL

OFFICERS OF SECTION

Chairman—David M. Bosworth, New York.
Vice Chairman—Walter P. Blount, Milwaukee.
Secretary—Joseph S. Barr, Boston.
Executive Committee—Francis M. McKeever, Los Angeles; J. Warren White, Greenville, S. C.; David M. Bosworth, New York.

Wednesday, June 8—9 a. m.

The Effect of Some Common Drugs on the Intra-Articular Temperature.
Steven M. Horvath and Joseph L. Hollander, Philadelphia.
Discussion to be opened by A. R. Shands Jr., Wilmington, Del. and Paul C. Colonna, Philadelphia.

The Distinction Between Osteoarthritis and Osteophytosis of the Spine. Douglas H. Collins, Leeds, England.
Discussion to be opened by Philip D. Wilson, New York and Robert P. Kelly Jr., Atlanta, Ga.

Fibrous Dysplasia of Bone.
Paul Strassburger, C. Zent Garber and Halford Hallock, New York.
Discussion to be opened by C. Glenn Barber, Cleveland, and Douglas H. Collins, Leeds, England.

Parosteal Osteoma or Myoosseous Osteoma.
Charles F. Geschickter and Murray M. Copeland, Washington, D. C.
Discussion to be opened by H. L. Jaffe, New York, and Albert B. Ferguson, Boston.

Irritation of the Tibial and Peroneal Nerves as an Unrecognized Cause of Knee Pain.
Allen S. Lloyd, Washington, D. C.
Discussion to be opened by I. W. Nachlas, Baltimore, and Julius S. Neviaser, Washington, D. C.

The Spontaneous Rupture of the Extensor Pollicis Longus Tendon Following Colles Fracture.
Edwin David Weinberg, Baltimore.
Discussion to be opened by J. S. Donaldson, Pittsburgh, and John H. T. Sweet Jr., Hartford, Conn.

Thursday, June 9—9 a. m.

ELECTION OF OFFICERS

Medullary Nailing: A Comparative Study of Skeletal Traction, Dual Plating and Medullary Nailing.
Dana M. Street, Memphis, Tenn.
Discussion to be opened by G. O. Eaton, Baltimore, and Leslie V. Rush, Meridian, Miss.

Chairman's Address. David M. Bosworth, New York.

The Treatment of Fracture-Dislocation of the Spine by Open Reduction and Internal Fixation.
J. G. Petrie and William V. Cone, Montreal, Canada.
Discussion to be opened by E. F. Cave, Boston, and Harrison L. McLaughlin, New York.

Injuries of the Medial Epicondyle of the Humerus.
Frederick M. Smith, New York.
Discussion to be opened by Leonard T. Peterson, Washington, D. C., and Maurice M. Pike, Hartford, Conn.

Roentgenographic Union of Bone Fragments.
Albert B. Ferguson, Boston.
Discussion to be opened by Lenox D. Baker, Durham, N. C., and Ralph S. Bromer, Bryn Mawr, Pa.

Friday, June 10—9 a. m.

A Summary of the Ski Fractures in the Stowe, Vermont, Area for the Past Five Years.
Robert Leland Maynard, Burlington, Vt.
Discussion to be opened by Kenneth Christophe, Brookline, Mass., and Robert H. Kennedy, New York.

Infection of the Hip Joint by Brucella Suis.
Mark B. Coventry, John C. Ivins, L. A. Weed and D. R. Nichols, Rochester, Minn.
Discussion to be opened by R. Beverly Raney, Durham, N. C., and Benjamin M. Baker Jr., Baltimore.

Pyogenic Arthritis of the Hip in Infants.
Jesse T. Nicholson, Philadelphia.
Discussion to be opened by Henry B. Crawford, Rochester, N. Y., and John A. Heberling, Pittsburgh.

Treatment of Congenital Dislocation of the Hip Without Open Surgery.
Edward L. Compere and William J. Schnute, Chicago.
Discussion to be opened by J. Warren White, Greenville, S. C., and G. deN. Hough Jr., Springfield, Mass.

Metatarsus Adductus More Prevalent Than Clubfoot.
Donald W. McCormick and Walter P. Blount, Milwaukee.
Discussion to be opened by Philip Lewin, Chicago, and Charles W. Peabody, Detroit.

Streptomycin Combined with Surgery in the Treatment of Bone and Joint Tuberculosis.
Alan DeF. Smith and Horace I. Yu, New York.
Discussion to be opened by Charles N. Pease, Chicago, and Paul W. Hugenberger, Boston.

SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

MEETS IN ST. DENNIS ROOM OF DENNIS HOTEL

OFFICERS OF SECTION

Chairman—William H. Daniel, Los Angeles.
Vice Chairman—Russell S. Boles, Philadelphia.
Secretary—Grant H. Laing, Chicago.
Executive Committee—Martin S. Kleckner, Allentown, Pa.; Sara M. Jordan, Boston; William H. Daniel, Los Angeles.

Wednesday, June 8—2 p. m.

The Role of the Esophagus in Local and Systemic Disease.
Edwin Boros, New York.
Discussion to be opened by Moses Paulson, Baltimore, and Edward B. Benedict, Boston.

History of Hemorrhage in Ulcer.
Samuel A. Wilkinson Jr. and Martin L. Tracey, Boston.
Discussion to be opened by Donovan C. Browne, New Orleans, and Samuel Marshall, Boston.

Gastric Acidity Before and After Development of Gastric Cancer.
Manfred W. Comfort, Rochester, Minn.
Discussion to be opened by Arthur J. Atkinson, Chicago, and Leon Schiff, Cincinnati.

The Treatment of Hiatus Hernia in Older People.
Otto C. Pickhardt and Henry A. Rafsky, New York.
Discussion to be opened by Irving B. Brick, Washington, D. C., and Herbert Caisle Maier, New York.

Some Fallacies in the Clinical Measurement of Gastric Acidity with Special Reference to the Histamine Test.
Harry Shay, S. A. Komarov and J. Edward Berk, Philadelphia.
Discussion to be opened by H. L. Bockus, Philadelphia, and Franklin Hollander, New York.

The Use of Orally Administered Intestinal Extracts in the Treatment of Peptic Ulcer.
C. W. Wirts and M. H. F. Friedman, Philadelphia.
Discussion to be opened by David J. Sandweiss, Detroit, and H. Marvin Pollard, Ann Arbor, Mich.

A Clinical Evaluation of Various Tests for Occult Blood in the Feces.
Stanley O. Hoerr, William R. Bliss and James Kauffman, Columbus, Ohio.

Melena.
Harold Lincoln Thompson and Devere W. McGuffin, Los Angeles.
Discussion to be opened by Z. T. Bercovitz, New York, and John E. Dunphy, Boston.

The Diagnosis of Lesions Near the Cardia.
John H. Fitzgibbon, Portland, Ore.
Discussion to be opened by Russell Boles, Philadelphia, and Abe Aaron, Buffalo.

Thursday, June 9—2 p. m.

ELECTION OF OFFICERS

Chairman's Address: Obstructive Lesions of the Left Colon and Rectum.
William H. Daniel, Los Angeles.

An Evaluation of Conservative Surgery for Certain Rectal Adenomas Showing Malignant Change.
Samuel McLanahan, Glenn P. Grove and Richard Kieffer Jr., Baltimore.
Discussion to be opened by Harvey B. Stone, Baltimore, and Martin S. Kleckner, Allentown, Pa.

Diastatic Distention and Perforation of the Gastro-Intestinal Tract.
J. M. Ravid, New York.
Discussion to be opened by James P. Croce and Con Amore V. Burt, New York.

The Use of Duodenal Substance in the Treatment of Chronic Ulcerative Colitis.
Michael H. Streicher and Morton I. Grossman, Chicago.
Discussion to be opened by Burrill B. Crohn, New York, and Joseph B. Kirsner, Chicago.

The Association of Chronic Ulcerative Colitis and Carcinoma.
J. A. Bargen and William G. Sauer, Rochester, Minn.
Discussion to opened by Richard B. Cattell, Boston, and Walter L. Palmer, Chicago.

Appraisal of Abdominal Perineal Resection Without Colostomy and with Preservation of Sphincter Musculature Based on 1,000 Cases.
W. W. Babcock and Harry E. Bacon, Philadelphia.
Discussion to be opened by Lawrence Abel, London, England, and Louis E. Moon, Omaha.

Changes in Colon Accompanying Varying Emotional States.
William J. Grace, Stewart G. Wolf Jr. and Harold Wolff, New York.
Discussion to be opened by Thomas P. Almy and Ascher Winkelstein, New York.

Multiple Balloon Kymographic Recordings of the Action of Various Drugs on the Upper Small Intestine in Man.
William P. Chapman and Chester N. Jones, Boston.
Discussion to be opened by Franz Ingelfinger, Boston.

Friday, June 10—9 a. m.

JOINT MEETING WITH SECTION ON PATHOLOGY AND PHYSIOLOGY IN WEDGEWOOD ROOM, CHELSEA HOTEL

Acute and Chronic Pancreatitis. A. C. Ivy, Chicago.
Discussion to be opened by Sara M. Jordan and Sidney Farber, Boston.

Chronic Ulcerative Colitis: Proctoscopic Appearance.
J. Peerman Nesselrod, Evanston, Ill., and Jay M. Garner, Winnetka, Ill.
Discussion to be opened by J. A. Bargen, Rochester, Minn., and Sidney A. Portis, Chicago.

Early Detection of Carcinoma of the Stomach.
David State, Minneapolis.
Discussion to be opened by Russell H. Morgan, Baltimore, and Alexander Brunschweig, New York.

The Value of Gastric Biopsy as Obtained Through the Flexible Operating Gastroscope.
Edward B. Benedict, Boston.
Discussion to be opened by H. J. Moersch, Rochester, Minn., and Cecil O. Patterson, Dallas, Texas.

Diagnostic Problems in Jaundice.
Franklin M. Hanger, New York.
Discussion to be opened by Richard B. Capps, Chicago. and John R. Neefe, Philadelphia.

SECTION ON RADIOLOGY

MEETS IN VENETIAN ROOM OF AMBASSADOR HOTEL

OFFICERS OF SECTION

Chairman—Harry M. Weber, Rochester, Minn.
Vice Chairman—U. V. Portmann, Cleveland.
Secretary—Paul C. Hodges, Chicago.
Executive Committee—Bernard P. Widmann, Philadelphia; W. Walter Wasson, Denver; Harry M. Weber, Rochester, Minn.

Wednesday, June 8—2 p. m.

DIAGNOSTIC SESSION

Chairman's Address: The Significance of the Intestinal Polypoid Lesion.
Harry M. Weber, Rochester, Minn.

Incidence of Hiatus Hernia in Patients Without Symptoms.
Irving B. Brick and Harold I. Amory, Washington, D. C.
Discussion to be opened by Aubrey O. Hampton, Washington, D. C., and Stuart W. Harrington, Rochester, Minn.

X-Ray Differentiation Between Benign and Malignant Gastric Lesions.
Gerhart S. Schwarz, Clifton Springs, N. Y.

Roentgen Manifestations of Small Intestinal Bleeding.
Philip J. Hodes, Philadelphia.

Photofluorography in the Early Detection of Gastric Malignancy.
John F. Roach, Robert D. Sloan and Russell H. Morgan, Baltimore.
Discussion to be opened by Moses Paulson, Baltimore, and Paul C. Hodges, Chicago.

Fractional Air Contrast: Barium Enema for Demonstration of Lesions in the Lower Sigmoid.
Frank S. Windholz, San Francisco.

Thursday, June 9—2 p. m.

ELECTION OF OFFICERS

SYMPOSIUM ON THE X-RAY EXAMINATION OF THE SKULL AND THE BRAIN

(Conducted by Fred J. Hodges, Ann Arbor, Mich.)

Important X-Ray Aspects of the Cranial Vault.
Barton R. Young, Philadelphia.
Discussion to be opened by W. Edward Chamberlain, Philadelphia.

Important X-Ray Aspects of Intracranial Structures.
Merrill C. Sosman, Boston.
Discussion to be opened by Donald D. Matson, Boston.

Cranial Fracture. Lewis E. Etter, Warrendale, Pa.
Discussion to be opened by John F. Holt, Ann Arbor, Mich.

Encephalography. Robert Barden, Philadelphia.
Discussion to be opened by Hans H. Reese, Madison, Wis.

Ventriculography. Fred J. Hodges, Ann Arbor, Mich.
Discussion to be opened by Robert C. Bassett, Ann Arbor, Mich.

Cerebral Angiography.
C. R. Perryman, Baton Rouge, La.
Discussion to be opened by Carl F. List, Grand Rapids, Mich.

Friday, June 10—2 p. m.

THERAPY SESSION

Advances in Cardiovascular Angiography and Aortography as Applied to the Diagnosis of Congenital Heart Disease.
Wendell G. Scott and Sherwood Moore, St. Louis.
Discussion to be opened by Russell H. Morgan, Baltimore, and Edward Neuhauser, Boston.

Roentgen Therapy of Thrombophlebitis.
Jack Lasner, Claude Snead and E. L. Jenkinson, Chicago.
Discussion to be opened by Geza de Takats, Chicago, and Bernard P. Widmann, Philadelphia.

Radiation vs. Surgery for Cancer of the Lip.
George S. Sharp and Herbert F. Williams, Pasadena, Calif.
Discussion to be opened by Douglas Quick and Hayes S. Martin, New York.

The Treatment of Early Cancer of the Larynx.
Max Cutler, Chicago.
Discussion to be opened by John V. Blady, Philadelphia, and H. B. Phillips, New York.

Eradication and/or Palliation of Advanced and Radio-Resistant Tumors by Multicentric Irradiation.
H. Marks, New York.
Discussion to be opened by Maurice Lenz, New York, and David E. Ehrlich, Brooklyn.

Relative Radiosensitivities of Analogous Mammary Tumors. Anna Goldfeder, New York.
Discussion to be opened by Maurice Lenz, New York, and Frederick P. Ellinger, Bethesda, Md.

SECTION ON ANESTHESIOLOGY

MEETS IN VENETIAN ROOM OF AMBASSADOR HOTEL

OFFICERS OF SECTION

Chairman—C. Walter Metz, Denver.
Vice Chairman—Urban Eversole, Boston.
Secretary—John S. Lundy, Rochester, Minn.
Executive Committee—Charles F. McCuskey, Los Angeles; Ralph M. Tovell, Hartford, Conn.; C. Walter Metz, Denver.

Wednesday, June 8—9 a. m.

BUSINESS MEETING FOR PRESENTATION OF RESOLUTIONS TO THE HOUSE OF DELEGATES

REPORT OF DELEGATE ON 1948 SESSION

PANEL ON RELAXANTS

Pentothal-Curare Anesthesia in Upper Abdominal Surgery. Charles D. Anderson, Chicago.

Dimethyl Ether of d-Tubocurarine Iodide as an Adjunct to Anesthesia.
V. K. Stoelting and J. P. Graf, Indianapolis.

Experience with Relaxants During Anesthesia in Australia.
H. V. Daly and S. V. Marshall, Sydney, Australia.

The Use in Anesthesia of a New Synthetic Curarizing Agent. Geoffrey Organe, London, England.
Discussion to be opened by Harold R. Griffith, Montreal, Canada; Stuart C. Cullen, Iowa City, and W. D. M. Paton, London, England.

PANEL ON INTRAVENOUS PROCAINE

Intravenous Procaine Hydrochloride During General Anesthesia.
Ivan B. Taylor, Gerald Edmonds and Walter H. Comer, Detroit.

Some Clinical Experiences with Various Muscle Relaxing Agents in the Management of Patients with Tetanus.
Harold E. Godman and John Adriani, New Orleans.

The Use of Intravenous Procaine in the Management of Arthritis.
David J. Graubard, New York, and Milton C. Peterson, Kansas City, Mo.
Discussion to be opened by Julia G. Arrowood, Boston, and Stevens J. Martin, Hartford, Conn.

Thursday, June 9—9 a. m.

ELECTION OF OFFICERS

Anesthesia for the Paraplegic.
Commander James G. Kurfees (M.C.) U. S. N.; Lieutenant Scott Whitehouse (M.C.) U. S. N., and Lieutenant Frank Cerzosimo (M.C.) U. S. N.
Discussion to be opened by Lewis H. Wright, Great Neck, N. Y., and Dwight D. Grove, Philadelphia.

The Choice of Anesthesia in Patients with Emphysema.
Perry P. Volpitto and John M. Brown, Augusta, Ga.
Discussion to be opened by Irving R. Hayman, Paterson, N. J., and R. Douglas Sanders, Wilmington, Del.

The Use of Sodium Pentothal and Local Procaine Anesthesia in Extrapleural Thoracoplasty in the Treatment of Pulmonary Tuberculosis.
Major Walter L. Lumpkin, Medical Corps, U. S. A., and Colonel James H. Forsee, Medical Corps, U. S. A.
Discussion to be opened by Lieutenant Colonel Charles H. Mitchell, Medical Corps, U. S. A., and M. Gene Black, Holyoke, Mass.

Chairman's Address: Anesthesia, Past and Present.
C. Walter Metz, Denver.

Complications of Spinal Anesthesia: An Evaluation of Complications Encountered in 7,000 Patients.
Clarence L. Hebert, Staten Island, N. Y., and Carl E. Tetirick, Columbus, Ohio.
Discussion to be opened by Lieutenant Colonel John Gardiner, M.C., U. S. A., and Mayer Saklad, Providence, R. I.

Supportive Therapy During Anesthesia and Operation.
Thomas H. Seldon, Rochester, Minn.
Discussion to be opened by Donald E. Hale, Cleveland, and Earl F. Weir, Dallas, Texas.

Friday, June 10—9 a. m.

JOINT MEETING WITH SECTION ON SURGERY, GENERAL AND ABDOMINAL, IN AMERICAN ROOM, HOTEL TRAYMORE

Preliminary Report of the Committee on Operative Mortality. Frederick P. Haugen, Portland, Ore.
Discussion to be opened by Henry K. Beecher, Boston, and Ambrose H. Storck, New Orleans.

Management of Pain.
F. A. Duncan Alexander, McKinney, Texas, and T. McD. Anderson, Dallas, Texas.
Discussion to be opened by Henry S. Ruth, Haverford, Pa., and James C. White, Boston.

Cyclopropane Anesthesia.
Lloyd H. Mousel, Washington, D. C.
Discussion to be opened by Robert D. Dripps, Philadelphia, and Frank B. Berry, New York.

Cardiac Arrest During Anesthesia and Surgery.
Claude S. Beck and H. J. Rand, Cleveland.
Discussion to be opened by Thomas J. Dry, Rochester, Minn., and Frank Lahey, Boston.

Anesthesia in Thoracic Surgery.
John C. Jones, Los Angeles.
Discussion to be opened by Charles F. McCuskey, Los Angeles, and Victor Richards, San Francisco.

Anesthesia in Infants and Young Children for Major Surgical Procedures. C. R. Stephen, Montreal, Canada.
Discussion to be opened by Curtiss B. Hickcox, Hartford, Conn., and Edward J. Donovan, New York.

SECTION ON GENERAL PRACTICE

MEETS IN TRIMBLE HALL OF CLARIDGE HOTEL

OFFICERS OF SECTION

Chairman—Winfred B. Harm, Detroit.
Vice Chairman—Milton B. Casebolt, Kansas City, Mo.
Secretary—Thomas E. Robinson, Salt Lake City.
Executive Committee—Paul A. Davis, Akron, Ohio; Eric A. Royston, Los Angeles; Winfred B. Harm, Detroit.

Wednesday, June 8—9 a. m.

Chairman's Address. W. B. Harm, Detroit.

Approach to the Diagnosis of Common Types of Congenital Heart Disease. David I. Rutledge, Boston.

Recent Advances in the Treatment of Hematologic Disorders. Cyrus C. Sturgis, Ann Arbor, Mich.
Discussion to be opened by Robert A. Hettig, Houston, Texas, and S. M. Goldhamer, Cleveland.

Diagnosis and Treatment of Acute Coronary Diseases.
Arthur M. Master and Simon Dack, New York.
Discussion to be opened by B. S. Oppenheimer, New York, and L. Reiner, Belleville, N. J.

Contributions to the Therapy of the Varicose Complex.
Egmont J. Orbach, New Britain, Conn.
Discussion to be opened by William M. Cooper, New York, and L. Reiner, Belleville, N. J.

A High Calory Diet in the Treatment of Diarrhea in Infancy. Edward Scott O'Keefe, Lynn, Mass.

The Treatment of Allergies as Seen in General Practice.
Fred W. Wittich, Minneapolis.
Discussion to be opened by Harold A. Abramson, New York, and George E. Rockwell, Milford, Ohio.

Thursday, June 9—9 a. m.

ELECTION OF OFFICERS

Diagnosis of Osteoarthritis.
Augustus M. Davison, Hot Springs National Park, Ark.

Results of Gold Therapy in Early Cases of Rheumatoid Arthritis.
Chester H. Adams and Russell L. Cecil, New York.
Discussion to be opened by Richard H. Freyberg and Ralph H. Boots, New York.

Diagnosis and Treatment of Mechanical Backache: The Most Common Type of Low Back Pain.
George S. Phalen, Cleveland.

The Injection of Analgesic Drugs in the Treatment of Musculofascial Pain.
Ralph L. Gorrell, Clarion, Iowa.
Discussion to be opened by Janet Travell, New York.

Friday, June 10—9 a. m.

Hernia in General Practice.
Edward F. McLaughlin, Philadelphia.

Newer Concepts of Recognition and Prevention of Congenital Dislocations of the Hip.
Reed S. Clegg, Salt Lake City.

The Diagnosis and Treatment of Cancer of the Lower Gastrointestinal Tract.
Fred W. Rankin, Lexington, Ky.
Discussion to be opened by T. E. Jones, Cleveland, and R. K. Gilchrist, Chicago.

War Surgery: Motion Picture in Color of Front Line Surgery. William C. Roberts, Panama City, Fla.

Jaundice. Philip Thorek, Chicago.
Discussion to be opened by Elmer C. Texter, Detroit, and R. B. Robins, Camden, Ark.

Intrathoracic Neoplasia.
Alton Ochsner, New Orleans.
Discussion to be opened by Brian B. Blades, Washington, D. C., and William F. Rienhoff, Baltimore.

SECTION ON DISEASES OF THE CHEST

MEETS IN TRIMBLE HALL OF CLARIDGE HOTEL

OFFICERS OF SECTION

Chairman—S. U. Marietta, Washington, D. C.
Vice Chairman—Harry C. Warren, San Francisco.
Secretary—Jay A. Myers, Minneapolis.

Wednesday, June 8—2 p. m.

Chairman's Address. S. U. Marietta, Washington, D. C.

Streptomycin and Dihydrostreptomycin in the Treatment of Tuberculosis. H. McLeod Riggins, New York.
Discussion to be opened by Herman E. Hilleboe, Albany, N. Y., and S. A. Waksman, New Brunswick, N. J.

Individual Variations in the Pulmonary Reaction to Dust.
Arthur J. Vorwald, Saranac Lake, N. Y.
Discussion to be opened by A. J. Lanza, New York, and J. J. Waring, Denver.

What Can Prophylactic Vaccination (BCG) Against Tuberculosis Contribute to the Control of This Disease? Edgar M. Medlar, Sunmount, N. Y.
Discussion to be opened by Robert J. Anderson, Washington, D. C., and Henry C. Sweany, Chicago.

Bronchial Adenoma.
Herman J. Moersch and John R. McDonald, Rochester, Minn.
Discussion to be opened by Porter P. Vinson, Richmond, Va., and Seymour M. Farber, San Francisco.

The Evaluation of Artificial Pneumothorax and Pneumoperitoneum. Andrew L. Banyai, Milwaukee.
Discussion to be opened by Harold G. Trimble, Oakland, Calif., and Benjamin L. Brock, Downey, Ill.

Thursday, June 9—2 p. m.

ELECTION OF OFFICERS

Limitations of X-Ray Examination in the Diagnosis of Diseases of the Chest. Leo G. Rigler, Minneapolis.
Discussion to be opened by Lawrence L. Robbins, Boston, and Philip Hodes, Philadelphia.

Pulmonary Emphysema. Edgar Mayer, New York.
Discussion to be opened by Alvan L. Barach, New York, and Maurice S. Segal, Boston.

The Silent Phase of Lung Cancer.
Richard H. Overhold, Brookline, Mass.
Discussion to be opened by John E. Dunn, Washington, D. C., and Otto C. Brantigan, Baltimore.

A Critical Evaluation of Mass X-Ray Surveys.
David A. Cooper and Katharine R. Boucot, Philadelphia.
Discussion to be opened by William Roemmick, Baltimore, and W. E. Chamberlain, Philadelphia.

Pulmonary Mycosis. David T. Smith, Durham, N. C.
Discussion to be opened by Chris J. D. Zarafonetis, Ann Arbor, Mich., and Hollis E. Johnson, Nashville, Tenn.

SECTION ON MISCELLANEOUS TOPICS

SESSION ON PHYSICAL MEDICINE AND REHABILITATION

MEETS IN OCEAN HALL OF MARLBOROUGH-BLENHEIM HOTEL

OFFICERS OF SESSION

Chairman—Howard A. Rusk, New York.
Secretary—Frank H. Krusen, Rochester, Minn.

Wednesday, June 8—9 a. m.

The Principles of Remedial Exercise.
Svend Clemmesen, Copenhagen, Denmark.

Coordination Exercises and Vitamin B_{12} for Combined Degeneration of the Spinal Cord in Pernicious Anemia.
Frank H. Krusen, Byron E. Hall and Henry W. Woltman, Rochester, Minn.

The Rehabilitation of Quadriplegics.
Samuel S. Sverdlik and Howard A. Rusk, New York.

Physical Medicine and Rehabilitation in the Veterans Administration. Lewis B. Newman, Hines, Ill.

PANEL DISCUSSION ON CERTAIN COMMON PROCEDURES IN PHYSICAL MEDICINE AND REHABILITATION

Howard A. Rusk, New York, Moderator

What Every Physician Should Know About the Teaching of Crutch Walking. George G. Deaver, New York.

What Every Physician Should Know About Occupational Therapy. Sidney Licht, Boston.

What Every Physician Should Know About Prescribing Physical Therapy.
Gordon M. Martin, Rochester, Minn.

What Every Physician Should Know About the Office Practice of Physical Medicine and Rehabilitation.
George M. Piersol, Philadelphia.

What Every Physician Should Know About the Hospital Practice of Physical Medicine and Rehabilitation.
William D. Paul, Iowa City.

Thursday, June 9—9 a. m.

Physical Medicine as Related to Rheumatic Diseases.
William S. C. Copeman, London, England.

What the Council on Physical Medicine and Rehabilitation Has to Offer the Physician.
John S. Coulter, Howard A. Carter and Frederic T. Jung, Chicago.

Physical Treatment of Common Lesions of the Shoulder.
William S. Tegner, London, England.

Physical Medicine in Peripheral Vascular Diseases.
William Bierman, New York.

PANEL DISCUSSION ON CERTAIN COMMON INDICATIONS FOR PHYSICAL MEDICINE AND REHABILITATION

Howard A. Rusk, New York, Moderator

What Every Physician Should Know About the Rehabilitation of the Crippled Child.
Alfred R. Shands Jr., Wilmington, Del.

What Every Physician Should Know About the Physical Treatment of Backache. Hans Kraus, New York.

What Every Physician Should Know About Physical Medicine and Rehabilitation in Prevention of Chronic Invalidism.
F. A. Hellebrandt, Richmond, Va.

What Every Physician Should Know About Physical Fitness. Robert C. Darling, New York.

What Every Physician Should Know About Physical Medicine and Rehabilitation for Industrial Injuries.
Donald A. Covalt, New York.

SESSION ON ALLERGY

MEETS IN RENAISSANCE ROOM OF AMBASSADOR HOTEL

OFFICERS OF SESSION

Chairman—CHARLES H. EYERMANN, St. Louis.
Secretary—HARRY L. HUBER, Chicago.

Friday, June 10—9 a. m.

Asthma in Children: Salient Diagnostic Problems. BRET RATNER, New York.
Discussion to be opened by JAMES C. OVERALL, Nashville, Tenn.

Rationale of Therapy with Bacterial Vaccines in Allergic Diseases. OSCAR SWINEFORD JR., Charlottesville, Va.
Discussion to be opened by WALTER S. BURRAGE, Boston.

Status Asthmaticus. GEORGE PINESS, Los Angeles.
Discussion to be opened by MAURICE S. SEGAL, Boston.

Provocative Diets in the Recognition of Food Allergy. HOWARD J. LEE, Milwaukee.
Discussion to be opened by HAL McC. DAVISON, Atlanta, Ga.

Dermatoses Which May Have an Allergic Etiology. JAMES R. WEBSTER, Chicago.
Discussion to be opened by NELSON Paul ANDERSON, Los Angeles.

The Clinical Indications and Limitations of the Antihistaminic Drugs in Allergy. WALTER L. WINKENWERDER, Baltimore.
Discussion to be opened by J. HARVEY BLACK, Dallas, Texas.

Chairman's Address: Clinical Experiences with the Diagnosis of Asthma. CHARLES H. EYERMANN, St. Louis.

THE SCIENTIFIC EXHIBIT

Fiftieth Anniversary

FRANK B. WYNN

Founder of the Scientific Exhibit, American Medical Association

Frank B. Wynn was born in 1860 at Brookville, Ind. He graduated from DePauw University in 1883 and from the Medical College of Ohio in 1885. After graduation he was in general practice five years and then studied in the great medical centers of Europe, majoring in pathology, diagnosis and internal medicine. He began the practice of medicine in Indianapolis in 1893.

From the first he was greatly interested in the scientific aspects of medicine and was much more eager to use scientific laboratory methods than were the practitioners of that time. He insisted that postmortem examinations be made whenever possible. His zeal for these examinations was such that he went at all hours of the day and night to make such inquests for his fellow practitioners. He was severely criticized by his patients, by the public and even by some physicians who felt that his scientific interest was running away with his concern for the patient. Nevertheless he was extremely kind and unusually interested in the welfare of his patients.

As Dr. Wynn made these examinations he began to accumulate a collection of pathologic specimens. He used them in his clinical teaching at the Medical College of Indiana, with which he was connected as lecturer on physiology and demonstrator of pathology. He was a master in the art of physical diagnosis. As a teacher he was an inspiration to his students, and yet he was a strict preceptor. He would not tolerate slipshod work. He became professor of medicine at the Medical College in 1895 and held the position until his death.

Dr. Frank B. Wynn

In 1898 Dr. Wynn prepared a pathologic exhibit for the Indiana State Medical Meeting held on the campus of Purdue University at Lafayette. This exhibit was of great interest to the members, most of whom had never seen anything of the sort. It was suggested that the exhibit be taken to the 1899 Session of the American Medical Association at Columbus, Ohio. The Indiana State Medical Association voted the sum of $300 to pay the expenses of the venture. This was a new departure for the American Medical Association, and no provision had been made for the housing of such an exhibit.

Dr. Wynn, with the help of certain loyal workers, rented a room near the Grand Opera House where the Convention was meeting. He built shelves and tables with his own hands and in this humble way prepared an exhibit which made a deep impression on the members of the American Medical Association.

It was decided that such an exhibit should be continued and enlarged. A committee was unofficially appointed (THE JOURNAL, Jan. 20, 1900, p. 187) to carry out such plans. Dr. Wynn was secretary of this committee. Further action was taken (THE JOURNAL, March 17, 1900, p. 701) as follows:

> "Following the lead taken by the Indiana State Medical Society, at Columbus last June, in making an exhibit of pathological specimens it has been thought advisable to encourage such efforts, and this year there will be a more general exhibit in the exhibit hall."

Somewhat later there were created a Section on Pathology and a separate Scientific Exhibit. Dr. Wynn continued active in this work and served as chairman of the Committee on Scientific Exhibit (1901-1916). His chairman's address in the Section on Pathology in 1903 continues to set out the policies of the exhibit and was a masterpiece of wisdom and foresight.

In 1912 (THE JOURNAL, June 15, 1912, p. 58) Dr. Miles F. Porter of Fort Wayne, Ind., moved that whoever has charge of the location of the exhibit be instructed by the House of Delegates hereafter to give first choice of location to the Scientific Exhibit in Exhibition Hall.

Dr. Wynn was a man of the highest character, of fine appearance, striking personality, great earnestness and industry. He was a most conscientious physician and an honor to his state, his school and the medical profession. He was fond of mountain climbing and was killed as a result of a fall from Mt. Siyeh, Glacier National Park, July 27, 1922. His only son, James, died some twenty years ago, leaving a daughter, Barbara, who has recently received a master's degree at the University of Chicago and will hold a position in Northwestern University this coming year.

It is most fitting that Dr. Wynn's name be honored on the occasion of the Fiftieth Anniversary of the founding of the Scientific Exhibit.

The Scientific Exhibit will be located on the main floor and the stage of Convention Hall, with entrances from the Technical Exhibit. Clinical conferences will be held in special rooms on the second floor of Convention Hall.

The eighteen sections of the Scientific Assembly have arranged groups of exhibits dealing with the various specialties of medicine, but emphasis will be placed on the interest of the physician in general practice rather than that of the specialist. Two special exhibits have been authorized by the Board of Trustees—one dealing with fractures and the other observing the Fiftieth Anniversary of the founding of the Scientific Exhibit. Other features include exhibit symposiums on diabetes, arthritis and physical medicine. Clinical lectures will be conducted on diabetes and clinical pathology, while an outstanding group of motion pictures will be shown continuously throughout the week.

Admission to the Scientific Exhibit will be limited to persons wearing the Fellowship badge or other official badge of the Convention. The public will not be admitted to the Scientific Exhibit.

Thomas G. Hull, Director,
Scientific Exhibit

SPECIAL EXHIBITS

The Committee on Scientific Exhibit is sponsoring two special exhibits—one on fractures and the other on the Fiftieth Anniversary of the Scientific Exhibit.

Special Exhibit on Fractures

The Board of Trustees has again authorized a Special Exhibit on Fractures under the auspices of the following committee:

Kellogg Speed, Chicago, chairman.
Frederick A. Jostes, St. Louis.
Gordon M. Morrison, Boston.

The local representative of the Committee is Wilson S. Rise, Atlantic City.

The purpose of the exhibit is to stress elementary points in treatment based on the pathology of each type of fracture for instruction of the general practitioner.

Continuous demonstrations will be conducted daily from 9:00 a.m. to 12:00 noon and from 2:00 p.m. to 4:00 p.m. in six booths. The subjects covered this year are as follows:

Fracture of the Shaft of the Femur—Skin Traction in Bed.
Fracture of the Carpal Navicular.
Emergency Treatment, Fractures of the Lower Extremity.
Fixed Traction for Transportation.
Fractures of the Lower End of the Radius.
Fracture of the Ankle.
Compression Fracture of the Bodies of the Vertebrae.

A pamphlet has been prepared for distribution, giving the essential features of the exhibit.

Fiftieth Anniversary Exhibits

The Board of Trustees has authorized a group of exhibits commemorating the founding of The Scientific Exhibit in 1899. The first exhibit was on pathology, presented by the Indiana State Medical Association under the direction of Dr. Frank B. Wynn. The present exhibit deals with the life and activities of Dr. Wynn and shows the advances in pathology during the past fifty years.

The committees in charge are as follows:

Indiana Committee:

- Thurman B. Rice, Indianapolis, chairman.
- James O. Ritchey, Indianapolis.
- E. Vernon Hahn, Indianapolis.

Clinical Laboratory Committee:

- Peter A. Herbut, Philadelphia, chairman.
- Frank W. Konzelmann, Atlantic City, co-chairman.
- William P. Belk, Philadelphia, co-chairman.
- Frank Lynch, Philadelphia.
- Robert Norris, Philadelphia.
- Ernest Aegerter, Philadelphia.
- Claude P. Brown, Philadelphia.

Historical Exhibit

Presented by the Indiana Committee, in Cooperation with the Indiana University Medical School and the Indiana State Medical Association, Indianapolis.

This exhibit deals with the life and activities of Dr. Frank B. Wynn, who founded the Scientific Exhibit in 1899. Material showing some of the early exhibits and other memorabilia are presented.

Clinical Laboratory Exhibit

Presented by the Clinical Laboratory Committee in Cooperation with the Philadelphia Pathological Society and the Section on Clinical Pathology, Philadelphia County Medical Society.

The purpose of this exhibit is to present routine and accepted methods which should be a part of every clinical study, wherein the methods yield useful information. The general practitioner and others interested in the application of laboratory methods to the diagnosis of disease will find physician demonstrators available to discuss the principles, the application, the preparation of the patient and the interpretation of results. This may be considered a miniature postgraduate course in laboratory medicine for the benefit of the clinician.

I. Lowell A. Erf, Jefferson Medical College, Philadelphia:

Hematology: Bone marrow aspiration from sternum, vertebras and iliac crest will be discussed and demonstrated. Case records involving the Rh factor in which erythroblastosis or transfusion reactions have occurred will be presented. The Coombes test and its evaluation; a study of body fluid extent and the value of hematocrit readings will be presented also.

II. *Surgical Pathology:* Each day fresh unfixed material will be demonstrated, brought directly from the operating rooms of Philadelphia and Atlantic City Hospitals. In selected cases, frozen sections will be prepared and the microscopy discussed. There will be special demonstrations as follows:

A.—P. A. Herbut, Jefferson Medical College, Philadelphia:

Tumor Cytology: Smears, prepared by the Papanicolaou method, of sputum, bronchial secretions, pleural and ascitic fluid, urine, prostatic secretions and vaginal secretions will be demonstrated. Both normal and cancerous cells will be shown and the technic of obtaining the material and preparing the slides will be discussed.

B.—E. E. Aegerter, Temple University Medical School, Philadelphia:

Aspiration Biopsy: Demonstrations of the technic of handling small tissue specimens and needle aspiration biopsies, with illustrating slides, will be presented.

C.—Frank W. Konzelmann, Atlantic City Hospital, Atlantic City, N. J.:

Histoplasmosis: Demonstration of organisms in tissue and in culture.

III. S. Brant Rose, Chestnut Hill Hospital, Philadelphia.

Serology: Demonstration of Kline and Kolmer Wassermann tests. The cardiolipin antigen will be employed and its significance discussed. The heterophil antibody reaction in infectious mononucleosis and the Davidson differential test will be demonstrated.

IV. John W. Howard and E. G. Scott, The Delaware Hospital, Wilmington, Del.:

Medical Bacteriology: The exhibit demonstrates the thesis "Bacteriology as an Aid to Specific Therapy." As such, it will present illustrative examples of (1) the proper collection of bacteriologic specimens; (2) their prompt inoculation to appropriate culture mediums; (3) the steps required in a careful identification of pathogens and (4) the determination of the sensitivities of these organisms to antibiotic agents.

V. Lester Rauer, Frankford Hospital, Philadelphia:

Biochemical Methods: Methods and equipment commonly used in laboratory for acid-base and fluid balance determinations will be demonstrated. Certain newer, simplified procedures that allow for rapid determination of the foregoing will also be shown. The clinical application of results and the need for clinical laboratory teamwork are emphasized in the exhibit.

VI. Paul A. Greenmeyer, Radio Corporation of America, New York:

Electron Microscope: Radio Corporation of America will demonstrate two working models of the RCA Electron Microscope, and will show the technic employed in electron microscopy. In order to reveal the results obtained, there will be a comprehensive display of electron micrographs of viruses, bacterial pathogens, bacteriophage and cytologic specimens of interest to the medical profession. The electron microscopes will be operated to present visual evidence of the research accomplishments of medical science by means of this powerful tool. Specimens will be inserted in the electron microscope so that visitors may view projected images. This educational display will also attempt to indicate the future role of electron microscopy in direct diagnosis and clinical applications.

Clinical Lectures on Laboratory Methods

These lectures (to be given in committee room 3, second floor) will supplement the demonstrations on clinical laboratory methods given in the exhibit booths.

TUESDAY, June 7

10:15 a.m. *Fluid Balance.* William P. Belk, Episcopal Hospital, Philadelphia.

2:15 p.m. *Tumor Cytology. A Discussion of the Stained Smear in the Diagnosis of Cancer.* Peter A. Herbut, Jefferson Medical College, Philadelphia.

WEDNESDAY, June 8

10:15 a.m. *Interpretation of Serologic Tests for Syphilis. A Special Comment on the V.D.R.L. Slide Test.* S. Brant Rose, Chestnut Hill Hospital, Philadelphia.

2:15 p.m. *The Virus Diagnostic Research Laboratory.* M. Michael Sigel, University of Pennsylvania, Philadelphia.

THURSDAY, June 9

10:15 a.m. *Vitamin B_{12} in Blood Dyscrasias.* Lowell A. Erf, Jefferson Medical College, Philadelphia.

2:15 p.m. *Hyperglycemic and Hypoglycemic States.* Paul Cutler, Atlantic City Hospital, Atlantic City, N. J.

EXHIBIT SYMPOSIUM ON DIABETES

The following exhibits on diabetes are presented:

ELLIOTT P. JOSLIN, HOWARD F. ROOT, PRISCILLA WHITE, ALEXANDER MARBLE and ALLEN P. JOSLIN, George F. Baker Clinic, New England Deaconess Hospital, Boston:

Progress in the Treatment of Diabetes Mellitus: New data are presented on the treatment of diabetes and its complications, including coma, pregnancy, gangrene and surgery. Analyses of patients who have outlined their normal life expectancy after the onset of diabetes are shown, with a follow-up of 30,000 cases, including 2,700 childhood cases.

LOUIS I. DUBLIN, DONALD B. ARMSTRONG and HERBERT H. MARKS, Metropolitan Life Insurance Company, New York:

Progress in Diabetes — The Statistical Picture: Charts illustrate the trends in mortality from diabetes; (1) sex, age, regional, and other variations in mortality and morbidity from the disease; (2) new life tables for diabetic persons showing the progressive increase in expectation of life and comparisons with the general population; (3) factors influencing the longevity of persons with diabetes; (4) trends in the causes of death of diabetic persons and comparisons with the general population.

HUGH L. C. WILKERSON, Diabetes Section, United States Public Health Service, Boston:

Diabetes Detection and Education: The results of diabetes early case-finding work with referrals of cases to practicing physicians for therapy are depicted. A diabetes screening and detection booth will be operated, where all physicians and others attending the convention are invited to have a blood sugar analysis. The importance of cooperation between practicing physicians, health departments, voluntary organizations, research institutions and teaching institutions such as medical schools is emphasized.

FRANK N. ALLAN, Boston, **CHARLES H. BEST**, Toronto, and **GEORGE E. ANDERSON**, Brooklyn, American Diabetes Association:

Diabetes: The activities of the American Diabetes Association are presented.

Clinics and Conferences on Diabetes

Clinics and conferences on diabetes will be conducted by members of the George F. Baker Clinic and the American Diabetes Association under the chairmanship of Dr. Howard F. Root, Boston, in a conference room on the second floor of Convention Hall, directly above the diabetes exhibits.

The program follows:

MONDAY, June 6

2:00 p.m. *Diabetes Detection.* Howard F. Root, Boston.
2:30 p.m. *Insulin and Diabetes.* Charles H. Best, Toronto.
3:00 p.m. *Pitfalls of Diagnosis.* Henry J. John, Cleveland.
3:30 p.m. *Hypoglycemia.* Alexander Marble, Boston.
4:00 p.m. *Medical Treatment of Surgical Diabetes.* John A. Reed, Washington.
4:30 p.m. (title and name to come)

TUESDAY, June 7

10:00 a.m. *Diabetes and Thyroid Disease.* Frank N. Allan, Boston.
10:30 a.m. *Office Treatment.* Frederick W. Hipwell, Toronto.
11:00 a.m. (title to come). Alexander Marble, Boston.
11:30 a.m. *Prevention of Gangrene.* William H. Olmstead, St. Louis.
12 noon *Intercapillary Glomerulosclerosis.* Cecil Striker, Cincinnati.
12:30 p.m. *Diabetic Coma.* Howard F. Root, Boston.
1:00 p.m. *Use of Intermediate Insulins.* Arthur R. Colwell, Evanston.
1:30 p.m. *Diet and Insulin.* Alexander Marble, Boston.
2:00 p.m. *Insulin Resistance.* Leon Smelo, Birmingham.
2:30 p.m. *Arteriosclerosis.* Byron Bowen, Buffalo.
3:00 p.m. (title and name to come)
3:30 p.m. *Diabetes nad Surgery.* Howard F. Root, Boston.
4:00 p.m. *Pregnancy.* Lester J. Palmer, Seattle.
4:30 p.m. (title and name to come)

WEDNESDAY, June 8

10:00 a.m. *Diabetic Emergencies.* Allen P. Joslin, Boston.
10:30 a.m. *Is Hyperglycemia Harmful?* Henry T. Ricketts, Chicago.
11:00 a.m. *Diabetic Feet.* Frederick W. Williams, New York.
11:30 a.m. (title and name to come)
12 noon *Hypoglycemia.* Thomas P. Sharkey, Dayton.
12:30 p.m. *Insulin Atrophy.* Henry B. Mulholland, Charlottesville, Va.
1:00 p.m. (title and name to come)
1:30 p.m. *Pregnancy.* Priscilla White, Boston.
2:00 p.m. *Diabetes and Surgical Emergencies.* James A. Greene, Houston.
2:30 p.m. (title and name to come)
3:00 p.m. *Thyroidism and Diabetes.* Cyril MacBryde, St. Louis.
3:30 p.m. (title and name to come)
4:00 p.m. (title and name to come)

THURSDAY, June 9

10:00 a.m. (title and name to come)
10:30 a.m. (title to come). Allen P. Joslin, Boston.
11:00 a.m. Diagnosis. Thomas P. Sharkey, Dayton.
11:30 a.m. *Metabolism of the Uncontrolled Diabetic.* Herbert Pollack, New York.
12 noon *Modified PZI vs Globin Insulin.* Cyril MacBryde, St. Louis.
12:30 p.m. (title and name to come)
1:00 p.m. *Diet and Insulin.* Charles W. Styron, Raleigh, N. C.
1:30 p.m. (title and name to come)
2:00 p.m. Juvenile Diabetes. Priscilla White, Boston.
2:30 p.m. *Public Health and Diabetes.* Hugh L. C. Wilkerson, Boston.
3:00 p.m. *Acidosis.* Arthur R. Colwell, Evanston.

EXHIBIT SYMPOSIUM ON ARTHRITIS

The following exhibits on arthritis are presented in cooperation with the Arthritis and Rheumatism Foundation, New York:

P. S. HENCH and R. K. GHORMLEY, Mayo Clinic, Rochester, Minnesota, and **E. F. ROSENBERG**, Chicago:

Types of Rheumatic Disease: Exhibit presents a summary of the pathologic features together with characteristic clinical and roentgenologic changes of the commoner rheumatic diseases, such as rheumatoid arthritis, gout, gonorrheal and other specific arthritides, fibrositis, hypertrophic arthritis, Heberden's nodes, Charcot's joint, tuberculous arthritis and osteochondromatosis. Each type of disease is illustrated by means of clinical photographs, roentgenograms, histologic preparations and moulages.

William D. Robinson and Isadore Lampe, University Hospital, Ann Arbor, Mich., and Charley J. Smyth, Wayne County General Hospital, Eloise, Mich.:

Rheumatoid Spondylitis—Early Diagnosis and Treatment: The early symptoms, physical findings and roentgen appearance of this disease and its course are illustrated. Criteria for establishing the diagnosis are listed. Serial roentgenograms over a number of years are to depict stages of the disease and the immediate and long range results of roentgen therapy are presented. Indications for physical therapy are given.

Donald F. Hill, W. Paul Holbrook, C. A. L. Stephens, Leo J. Kent and Edna McCarthy, Tucson, Ariz.:

Treatment of Rheumatoid Arthritis: The exhibit shows the general basic outline of treatment of rheumatoid arthritis, including elective methods and doubtful methods. Photographs of ways in which deformities develop and methods of preventing them are presented, together with a system of corrective exercises. Correction of deformities are depicted, with methods and examples.

John H. Talbott, L. Maxwell Lockie and Bernard M. Norcross, University of Buffalo Medical School and Buffalo General Hospital, Buffalo, N. Y.:

Diagnosis and Treatment of Gouty Arthritis: The criteria are presented which are useful in the diagnosis of gout and gouty arthritis and for treatment of intercritical gout and acute gouty arthritis. Essential features of the disease are shown, together with some pertinent references to its history.

Robert M. Stecher, Walter M. Solomon and Ralph Wolpaw, Arthritic Clinic, City Hospital and Western Reserve University School of Medicine, Cleveland:

Heberden's Nodes—Osteoarthritis of Finger Joints: Heberden's nodes arise from trauma or idiopathically. The idiopathic type occurs ten times as commonly in women as in men. Incidence in women varied from 0.4 per cent in fourth decade to 30 per cent in ninth decade. The age of 99 women at onset ranged from 33 to 65 years, median age 49.8 years. Mothers were involved twice, sisters three times, as often as general population. Inheritance is a single autosomal factor, sex influenced, dominant in women and recessive in men, 30 per cent of women, .3 per cent of men being genotypically susceptible. Heberden's nodes and menopause are associated, having occurred within three years of each other in nearly half the cases. Correlation coefficient was +0.46 indicating common etiologic factors. Heberden's nodes are prevented when nerve supply is defective because of upper motor neuron lesion in stroke, or lower motor neuron lesion in anterior poliomyelitis or peripheral nerve section. Roentgenograms show spur formation on ventral and dorsal aspects of both bones of the joints. Heberden's nodes associated with abnormal incidence of osteoarthritis of other joints. There is no known prevention or cure. Heberden's nodes are a benign innocuous form of osteoarthritis. Better understanding of this disease may help solve more serious problems of joint disease.

Otto Steinbrocker, S. A. Isenberg, Sheldon Schwartz and Lyon Lapin, Bellevue Hospital, Fourth Medical Division, New York University, New York:

Reflex Dystrophy in the Extremities—Including Shoulder-Hand Syndrome: The various clinical features of reflex dystrophy are presented, with an analysis of causal factors and evaluation of therapy and results, especially with sympathetic block; illustrations of procedures.

Charles A. Ragan, Albert W. Grokoest, Hilary H. Holmes, James A. Coss, Jr. and Ralph H. Boots, Edward Daniels Faulkner Arthritis Presbyterian Hospital, New York:

Mesenchymal Tissue in Relation to Arthritis: A comparative study is presented of changes in the supporting structures, with particular reference to the interfibrillar substance in rheumatoid arthritis and other diseases with joint manifestations.

Richard H. Freyberg, Joseph J. Lankin and Jacques Durivage, Hospital for Special Surgery, Cornell University Medical College, New York:

Gold Therapy for Rheumatoid Arthritis: Knowledge now available concerning the nature of gold compounds and their behavior in the human body has proved a more scientific background for the physician to make a more accurate appraisal of the value of gold therapy and its shortcomings. This more fundamental information is presented, as background for the practical considerations of the choice of gold compound for clinical use, manner of administration and precautions to be employed. To help lessen the currently prevalent abuse of gold therapy, considerations of the selection of patients for such treatment, limitations of its value, potential toxicity and management of toxic reactions are emphasized. Trends of investigation that may improve gold treatment of rheumatoid arthritis are considered.

Theodore B. Bayles and Theodore A. Potter, Robert B. Brigham Hospital, Boston:

Medical and Orthopedic Treatment of Rheumatoid Arthritis: The classification of the common arthritides, the differential diagnosis of rheumatoid arthritis and other common conditions and the outline for the general medical and orthopedic care of the patient are presented. Photographs outlining the use of plaster shells in the care of joints by the orthopedists are displayed, as well as photographs of operative procedures.

Arthritis And Rheumatism Foundation, New York:

Arthritis and Rheumatism: Information and literature are available regarding the nationwide campaign against arthritis and rheumatism.

Joseph J. Bunim, Edward J. Bien, Currier McEwen, Leon Sokoloff and Sigmund Wilens, New York University College of Medicine, New York:

Rheumatic Diseases—Histologic and Biochemical Changes in Skeletal Muscle: Muscle was examined by biopsy from 202 persons, including 13 normal volunteers. Approximately 400 serial sections were made from each biopsy and every fifth section was studied.

Lesions similar to those previously described as specific for rheumatoid arthritis were found in 56 per cent of patients with rheumatoid arthritis. Lesions indistinguishable from these, however, were found in 3 of the 13 normal persons and in some patients with rheumatoid spondylitis, rheumatic fever, osteoarthritis, tuberculous arthritis, gout, subacute bacterial endocarditis and in several other diseases. These observations indicate that the muscle nodule described in rheumatoid arthritis is probably of no diagnostic value.

Muscle samples obtained by biopsy from 40 patients, including 13 normal controls, were analyzed for their contents of water, total protein, nonprotein nitrogen, myosin, collagen and adenosinetriphosphatase activity of the myosin. In patients with atrophy associated with various types of arthritis or with simple disuse, there were significant changes in muscle composition which included: (1) decrease in percentage of myosin and diminution of the adenosinetriphosphatase activity of the myosin; (2) fall in total protein content, and (3) absence of significant change in the average content of collagen. The changes in chemical composition correlated well with changes observed by histologic study of sections simultaneously made from the muscle samples analyzed.

Charles LeRoy Steinberg, Rochester General Hospital, Rochester, N. Y.:

Gold Toxicology in Rheumatoid Arthritis: Transparencies and charts indicate the toxicology and pharmacology of the usual gold salts employed in the treatment of active rheumatoid arthritis. Transparencies demonstrate the clinical course of exfoliative dermatitis due to gold therapy. The danger of gold salt medication is adequately described. Photomicrographs of the bone marrow in gold-treated patients are included. Early marrow eosinophilia and damage to the granulocytes are stressed. The beneficial clinical response with BAL therapy is shown in follow-up studies. Dosage, best method of administration and pharmacology of BAL are included.

EXHIBIT SYMPOSIUM ON PHYSICAL MEDICINE AND REHABILITATION

This exhibit includes physical therapy, occupational therapy and rehabilitation and is sponsored by the Baruch Committee on Physical Medicine. It is presented under the auspices of the following committee:

Frank H. Krusen, Rochester, Minn., chairman.
Winfred Overholser, Washington, D. C.
Howard A. Rusk, New York.

Howard A. Carter and Frederic T. Jung, Council on Physical Medicine, American Medical Association, Chicago:

Biophysics and Physical Medicine: The demonstration will be divided into four parts: (1) use of an oscillator and amplifier to demonstrate on the spot the effect of changing frequency of electrical currents ranging from 100 cycles per second to 200,000 per second; (2) use of a simple volt-ohmmeter to permit an onlooker to measure his own resistance: (3) mercury drop experiment to show the effects of direct current as compared with alternating current and high frequency currents in a manner analogous to the effects on muscle and nerve under electrical stimulation and (4) demonstration of inverse square law employing radiation instruments to show reduction in intensity of radiation as the distance is increased.

Julia F. Herrick and Joseph P. Engel (by invitation), Institute of Experimental Medicine, Mayo Foundation, and Section on Physical Medicine, Mayo Clinic, Rochester, Minn.:

Fundamental Studies on Microwave Diathermy and Measurement of Temperature: The demonstration will be divided into four parts: (1) demonstration of a new microwave transformer (matching animal tissue to free space); (2) demonstration of screening of microwave diathermy; (3) demonstration of a portable thermometer for measuring cutaneous temperatures, and (4) demonstration of the use of thermistors for measuring temperatures of the body.

Gordon M. Martin, Section on Physical Medicine, Mayo Clinic, Rochester, Minn.:

Therapeutic Exercises: The exhibit will demonstrate the importance of therapeutic exercise as a clinical measure for use in many conditions seen in general practice. Actual programs of exercise as applied in several common pathologic conditions will be shown. The requirements for successful employment of therapeutic exercise will be presented.

Miland E. Knapp and Frederic J. Kottke, Division of Physical Medicine, University of Minnesota School of Medicine, Minneapolis:

Physical Medicine and Rehabilitation of Fractures: The exhibit will consist of demonstrations on actual subjects of proper methods of physical treatment and rehabilitation of certain types of fractures commonly encountered in general practice.

F. A. Hellebrandt, Baruch Center on Physical Medicine, Medical College of Virginia, Richmond, and Walter S. McClellan, Saratoga Springs Commission, Saratoga Springs, N. Y.:

Spa Therapy in the United States: The value of information concerning the facilities at various accepted health resorts in the United States will be stressed, and it will be shown how health resorts serve the medical profession in the areas of general hygiene, dietary control, graduated exercise, physical therapy and diversional activities.

Winfred Overholser, St. Elizabeth's Hospital, Washington, D. C.:

Occupational Therapy in Psychiatry: The importance of occupational therapy in the management of psychiatric patients will be pointed out. Suitable apparatus and therapeutic procedures will be demonstrated. The major indications for occupational therapy will be cited.

Sedgwick Mead, Washington University School of Medicine, St. Louis:

Physical Treatment of Backache: A study of the factors contributing to "chronic low backache" will be presented. Methods of physical treatment and rehabilitation will be demonstrated. Anatomic studies, electromyographic studies and physical therapeutic procedures will be discussed.

A. B. C. Knudson, Division of Physical Medicine Rehabilitation, Veterans Administration, Washington, D. C.:

Rehabilitation of the Hard of Hearing: This exhibit will demonstrate the testing of hearing, fitting of hearing aids, speech reading, auditory training and a brief history of hearing aids from speaking trumpets to present devices. Samples of hearing aids now in use will be shown.

Henry H. Kessler, John Seeley, Donald Kerr and Earl Daniels, Kessler Institute, Newark, N. J.:

Rehabilitation of the Amputee: Charts, photographs and samples of prosthesis plus live demonstration of amputees in action are presented.

Howard A. Rusk, New York University College of Medicine, New York, and Jayne Shover (by invitation), National Society for Crippled Children and Adults, Chicago, in collaboration with the American Speech and Hearing Association:

Speech Rehabilitation: This exhibit will consist of six booths, each dealing with one phase of speech therapy: (1) stuttering, (2) articulation, (3) cleft palate, (4) cerebral palsy, (5) postlaryngectomy and (6) aphasia. In each booth a physician who specializes in the management of the particular speech defect, a speech correctionist and a speech therapist will demonstrate the appropriate methods of speech therapy on a patient suffering from the condition under consideration.

SECTION EXHIBITS

Each of the eighteen sections of the Scientific Assembly has arranged a group of exhibits dealing with the various branches of medicine.

Section on Internal Medicine

The representative to the Scientific Exhibit from the Section on Internal Medicine is Thomas C. Garrett, Sarasota, Fla. Included in this Section are the exhibit symposiums on arthritis and diabetes.

Charles A. Doan, B. K. Wiseman and Claude-Starr Wright, Ohio State University College of Medicine, Columbus, Ohio:

The Acute Leukemias: The criteria for differentiating the acute leukemic syndromes on the basis of the cell type involved, the monoblast, myeloblast and lymphoblast, are presented Evidence is beginning to accumulate which indicates a selective response to the new therapeutic agents, depending upon the principal cell type involved. The results of current specific therapy as applied to carefully differentiated types of leukemia are emphasized.

S. Zelig Sorkin and Louis J. Soffer, The Mount Sinai Hospital, New York:

Advance in the Therapy of Addison's Disease: The exhibit shows (1) the historical development of the treatment; (2) the actual methods, with dosage, etc., employed in the treatment of crisis and maintenance therapy, including pellet implantation; (3) the results obtained in terms of the prolongation in the period of survival in 50 patients treated during the past twenty years and the degree of restoration to normal activity in the patients currently under treatment. Transparencies illustrate characteristic clinical aspects of the disease.

Francis M. Rackemann, Walter S. Burrage and John W. Irwin, Massachusetts General Hospital, Boston:

Intrinsic Asthma: Charts and posters show that the cause is something which the patient carries with him. The place of intrinsic asthma in the classification of all cases is shown with certain facts and theories concerning the mechanism. An outline of treatment is given with a description of end results. Certain problems for the future are outlined.

Rita S. Finkler and George M. Cohn, Newark Beth Israel Hospital, Newark, N. J.:

Carbohydrate Metabolism in Endocrine Disturbances: In the consideration of any endocrinologic dysfunction, evaluation of the carbohydrate metabolism is of importance. In the majority, there is a concomitant disturbance of carbohydrate metabolism. The material presented in the exhibit will consider nonpancreatic disturbances of carbohydrate metabolism and their response to therapy. The following conditions are presented: (a) pituitary diseases including tumors, (b) hypothalamic disturbances, (c) thyroid diseases consisting of hypothyroid and hyperthyroid states, (d) disturbances of adrenal function and (e) disturbances of ovarian and testicular function.

Graham Asher, Laurence E. Steffen, Franklin D. Murphy and Mary Colglazier, University of Kansas School of Medicine, Kansas City, Mo.:

Effects of Mineral Deficiency on the Cardiovascular System: The exhibit shows records of experiments and clinical cases in mineral deficiency. New material on the ionizable state of the blood minerals is presented.

J. Q. Griffith, Jr., Philadelphia:

Cutaneous Capillary Microscopy in Hypertension—Relation to Prognosis: Some 2,000 persons with arterial hypertension but, initially at least, without evidence of renal failure, have been followed for four to twelve years. When first seen, studies included examination of the capillaries of the forearm through the capillary microscope, both before and after inclusion of the area in a histamine flare. Subjects are grouped according to the number of capillaries and degree of response to histamine, and comparisons made with subsequent mortality and morbidity.

Henry B. Kirkland, A. M. Lyle and Charles E. Kiessling, Prudential Insurance Company, Newark, N. J.:

Unipolar Extremity Leads in Electrocardiography: The exhibit shows the underlying theoretical principles of the augmented unipolar extremity leads, the synthesis of the standard leads and normal variations. Application of this technic is demonstrated in connection with electrocardiographic diagnosis.

Joseph T. Roberts, University of Buffalo School of Medicine and Veterans Administration Hospital, Batavia, N. Y.:

A New Blood Supply for Ischemia Hearts and the Role of Small Blood Vessels in the Heart and Nerves: The exhibit deals with original studies on blood vessels of the heart showing: (1) the discovery that the heart's blood supply may be renewed by connecting the coronary veins and the aorta; (2) changes in capillary blood supply of the heart in hypertrophy, dilatation and pain; (3) flow of blood in the thebesian vessels, and (4) the role of vasa nervorum in vasospastic or ischemic neuropathy, in peripheral vascular disease and in the mechanism of referred pain.

J. Scott Butterworth, Charles A. Poindexter, Clarence E. Peterson, Charles Rehnke and Arnold L. Wagner, New York University-Bellevue Medical Center, Post-Graduate Medical School, New York:

Visual and Auditory Teaching Aids in Cardiology: The exhibit demonstrates the multiple channel electronic stethoscope with heart tones and murmurs in a variety of conditions which have been recorded at 33 r.p.m. by a special apparatus. There is a demonstration of a specially built 10 inch lag screen kineoscope which portrays visually any type of electric current (i. e., electrocardiograms, sound tracings, vectrocardiograms). The exhibit also shows the value of using "black light" with fluorescent pigments to demonstrate charts and plastic injections of the vascular system of the heart. An apparatus for the teaching of fluoroscopy to a large group of students is included.

Myron Prinzmetal, Eliot Corday, I. C. Brill, Alvin L. Sellers, Walter Flieg and H. E. Kruger, Institute for Medical Research, Cedars of Lebanon Hospital, Los Angeles:

The Nature and Treatment of the Auricular Arrhythmias: Color cinematographs at 2,000 frames per second (130 times faster than normal) of the auricles of the intact dog's heart have been taken. Detail of auricular contraction can be visualized for the first time. Simultaneous electrocardiograms were taken employing direct auricular leads and indirect limb leads. The mechanisms of auricular flutter and auricular fibrillation can be clearly seen. It is proved that the circus movement theory of those arrhythmias is no longer tenable. Observations show that auricular extrasystole, paroxysmal auricular tachycardia, auricular flutter and auricular fibrillation are of a unitary nature and are due to impulses emitting from a single ectopic focus. The particular arrhythmia observed depends on the rate of discharge of impulses from this focus. The effect of quinidine on the contraction waves in the various auricular arrhythmias is demonstrated. The dramatic therapeutic action of digitalis on the dilated failing heart is well visualized. The various clinical applications of these studies are illustrated.

Arthur M. Master, Simon Dack, Leon Pordy, Mortimer Blumenthal, Leonard E. Field and Sidney Storch, Mount Sinai Hospital, New York:

The Two-Step Exercise Electrocardiogram — A Test for Coronary Insufficiency: Diagnosis of coronary disease is often complicated because objective evidence cannot be obtained in 25 to 50 per cent of patients. Physiologically, electrocardiographic indications of coronary insufficiency are more likely to become evident in tracings made after standard exercise than at rest. Coronary insufficiency is considered to be ruled out if two tests are negative, a standard "2-step" test and then a "double 2-step." Coronary insufficiency exists if the electrocardiogram following the "2-step" exercise is positive. Depression of the RS-T of over 0.5 mm. in any lead is a positive result; also a change from an upright T wave to an isoelectric or inverted T wave. The "2-step" test is a simple walking procedure and produces no untoward reactions.

Louis E. Siltzbach, Mount Sinai Hospital, New York, and Joseph C. Ehrlich, Lebanon Hospital, Bronx, N. Y.:

Nickerson-Kveim Skin Test for Sarcoidosis: The exhibit presents results of 120 skin tests performed on 50 patients in 3 main categories: (*a*) proved sarcoidosis, (*b*) suspected sarcoidosis and (*c*) proved nonsarcoid controls. Each test was read macroscopically and a biopsy was made, usually at the end of four weeks. Some of the tests were performed with a suspension of material from normal lymph nodes and normal spleen and the results were compared with those obtained with a suspension of sarcoid lymph nodes. Histopathologic criteria were elaborated which permit the characterization of a reaction as positive or negative. Eighty per cent of the reactions in proved sarcoidosis were positive, and in 3 patients the skin reaction was positive before a confirmatory biopsy of a natural lesion could be obtained.

Section on Surgery, General and Abdominal

The representative to the Scientific Exhibit from the Section on Surgery, General and Abdominal, is Walter G. Maddock, Chicago.

Orvar Swenson and Edward B. D. Neuhauser, Children's Medical Center, Boston:

New Concepts of Etiology and Treatment of Hirschsprung's Disease: A series of roentgenograms demonstrate a segment of bowel in the rectosigmoid and rectum which is narrow and has abnormal peristalsis and failure of relaxation. This functionally abnormal bowel is a partial obstruction and produces the dilatation and hypertrophy of the colon. Drawings are displayed of a new operative procedure to remove the functionally deficient bowel. Charts show the results of patients treated by this method. There have been no postoperative deaths, and all patients are doing well. Postoperative roentgenograms demonstrate essentially normal colons.

Arnold S. Jackson, Elwyn S. Shonyo and George P. Schwei, Jackson Clinic, Madison, Wis.:

Surgical Treatment of the Gallbladder and Common Bile Ducts: Various anomalies of the biliary arteries and ducts are presented, and methods of avoiding injury to the common duct. Surgical procedures of cholecystectomy and choledocholithotomy are depicted by a series of charts and illustrations. Results on 1,200 operations on the biliary tract are tabulated, with clinical symptoms, cholangiogram studies, findings at operation, pathologic studies and the end results.

Albert Behrend, Moses Behrend, Benjamin Greenspan, Milton Cullen and Hymen D. Stein, Jewish Hospital, Philadelphia:

Surgical Jaundice: The exhibit shows the normal and abnormal physiology of the biliary system, the etiology and differential diagnosis of surgical jaundice, the evaluation of various liver function tests in relation to surgical jaundice and the treatment of various forms of surgical jaundice.

Joseph L. Posch, Wayne University College of Medicine and the Detroit Receiving Hospital, Detroit:

Care of the Injured Hand: The exhibit consists of a brief presentation of the anatomic and physiologic considerations in primary tendon repair and nerve suture. Immediate corrective procedures and methods of clinical care are demonstrated and follow-up studies with results and complications shown.

R. W. Postlethwait and H. H. Bradshaw, Bowman Gray School of Medicine, Winston-Salem, N. C.:

Deaths Following Vagotomy: Since 1942 vagotomy has assumed increasing importance in the treatment of peptic ulcer. Fortunately, no one surgeon has had a large number of deaths after this procedure. To evaluate the possibility that unusual physiologic or pathologic changes might be factors in the mortality rate, an analysis has been made of deaths after vagotomy. Abstracts of such fatalities were obtained from surgeons throughout the country. The results of this study are presented.

John Fallon, James T. Brosnan, John Meyers and John J. Manning, Fallon Clinic, Worcester, Mass.:

Endometriosis and the General Surgeon: Endometriosis is not a problem for the gynecologist alone. It is met fairly frequently in general surgery and general practice: thus, the exhibitors see more women with endometriosis than with appendicitis. Four hundred cases are analyzed to illustrate diagnostic pitfalls, including occurrence in youth; infrequently described lesions are exhibited and a diagnostic syndrome is suggested. The syndrome consists of (*a*) cumulatively increasing period-linked pain, (*b*) in a mature woman without young children.

E. L. MacQuiddy, H. J. Bucholz and David Rhea, Omaha:

Adhesive Tape Irritations. This exhibit demonstrates the types of adhesive reactions on the human skin as well as a chart indicating the changes in p_H and changes in temperatures from beneath the tape, as well as the study of the bacterial and fungus flora from beneath adhesive tapes.

Hilger Perry Jenkins, Douglas K. Packard, Rudolph Janda and David Fox, University of Illinois College of Medicine and Woodlawn Hospital, Chicago:

Therapeutic Intestinal Intubation: The indications for intubation for relief of intestinal distention are presented by roentgenographic studies of illustrative cases. The mechanical details which are necessary for the successful use of the intestinal tubes are demonstrated with the aid of a mannikin. The various types of tubes, the hazards and the limitations of intubation are pointed out. Cases are reviewed in which the intestinal intubation was used to obtain decompression of the distended small intestine due to obstruction or paralytic ileus, thus obviating emergency surgery or permitting operation under more favorable circumstances.

Byrne M. Daly, Elwood A. Sharp, Walter H. Seegers and Thomas B. Patton, Wayne University College of Medicine, Detroit and Dearborn, Mich.:

Thrombin and Its Application in Upper Gastrointestinal Hemorrhage: The exhibit describes the clotting mechanism, the properties and action and its clinical use of thrombin, especially in regard to use in hemorrhage from bleeding from the esophagus, stomach and duodenum.

John H. Kay and Alton Ochsner, Tulane University School of Medicine, New Orleans, La.:

Newer Aspects of Blood Coagulation in Relation to Thrombosis: The interrelationship of the various single components involved in coagulation of the blood (including blood enzymes and antithrombin) is presented graphically as it is known up to this time. Certain newly recognized mechanisms of intravascular coagulation are demonstrated, and an attempt is made to evaluate the relative clinical importance of each one.

Herbert Willy Meyer and Stephen L. Gumport, Post-Graduate Medical School, New York University-Bellevue Medical Center, New York:

Cancer of the Breast: The exhibit shows historic background of the radical operation for cancer of the breast as taught by Halsted and Willy Meyer in 1894, differential diagnosis of cancer of the breast, principles, technic and results of radical operation, radiation and sterilization as part of treatment at times, and modern concept of hormone treatment in inoperable and metastatic cancer of the breast.

Stanley E. Lawton, Charles E. Fildes and Leon Seidman, University of Illinois College of Medicine and Hines Hospital, Chicago:

Cancer of the Stomach: This exhibit portrays what happened before, during and after hospitalization of 1,004 patients with cancer of the stomach—a disease known to be curable yet expected to kill over 38,000 persons during 1949. Importance of discovery of early pathologic lesions is emphasized and methods for reducing the high death rate are presented.

Clarence E. Gardner Jr. and Thomas Ray Broadbent, Duke Hospital, Durham, N. C.:

Anomalies of Intestinal Rotation: Charts, diagrams and drawings of the normal process of intestinal rotation and of abnormalities in each of the three stages of rotation as they occur in patients seen at the Duke Hospital are shown.

Darrell A. Campbell and R. Glenn Smith, Wayne County General Hospital, Eloise, Mich.:

Arteriographic Examination of the Lower Extremity: The exhibit includes (*a*) drawings illustrating a classification of arteriosclerosis obliterans, (*b*) drawings portraying the technic of the procedure and (*c*) drawings, roentgenograms and photographs correlating the arteriographic observations with the clinical status of the extremity.

J. Ross Veal, John N. Shadid and Thomas J. Dugan, Georgetown University Medical School, Washington, D. C.:

Surgery of the Sympathetic Nervous System: A demonstration of the anatomy of the sympathetic nervous system is presented, with the correlation of the normal physiology with pathologic conditions influenced by sympathectomy. The indications, the selection of cases and the type of sympathectomy required in these conditions are shown, together with the complications and end results of sympathectomy.

James Barrett Brown, L. T. Byars, Frank McDowell and Minot P. Fryer, St. Louis:

Reconstructive and Plastic Surgery of the Nose: Lesions and deformities of the nose, including neoplasms and the results of treatment, are presented, with radiation burns, distortions associated with cleft lips, gunshot wounds, traffic accidents, other congenital and acquired deformities, such as those developing late after early childhood fractures. Diagrams and photographs illustrate the use of composite free grafts of the ear for nasal reconstruction.

MALCOLM T. MACEACHERN, American College of Surgeons, Chicago:

Hospital Standardization: The exhibit demonstrates the point rating system recently instituted by the College. It provides an objective measuring stick for evaluating hospital standardization in relation to the minimum standard. The exhibit consists of charts, posters and photographs showing the various aspects of the point rating system and their method of application.

CHARLES F. BRANCH, American College of Surgeons, Chicago:

Cancer Control: An exhibit of cards and posters showing the work of the American College of Surgeons in stimulating, inspecting and standardizing cancer facilities, including cancer hospitals, cancer clinics, cancer diagnostic clinics and cancer detection centers, throughout the country. An endeavor is made to demonstrate that cancer control begins in the doctor's office.

Section on Obstetrics and Gynecology

The representative to the Scientific Exhibit from the Section on Obstetrics and Gynecology is Frederick H. Falls, Chicago.

A. R. ABARBANEL, Institute of Experimental Medicine, College of Medical Evangelists, Los Angeles, Calif.:

Effects of Various Oxytocics on Human Pregnant Uterus: Charts show effects of various oxytocics (posterior pituitary preparations, quinine, ergonovine, methyl ergonovine, methergen) on human pregnant uteri. Dangers of each are fully emphasized.

HENRY C. FALK, Beth Israel Hospital, New York:

Technic of Total Abdominal Hysterectomy: Each step in the procedure of total abdominal hysterectomy is presented by moulages, with drawings showing the intermediate steps that cannot otherwise be shown.

FREDERICK H. FALLS, University of Illinois College of Medicine, and CHARLOTTE S. HOLT, Illinois State Department of Public Health, Chicago:

Breech Presentation: Breech presentation is depicted in relation to its etiology, diagnosis, pathology and management, including fetal and maternal considerations and normal mechanism of breech.

DERYL HART and JAMES D. MOODY, Duke Hospital, Durham, N. C.:

Experimental Studies Demonstrating Controlled Variations in the Sex Ratio: On the basis of experimental studies and a statistical analysis of large numbers of human twins, the time factor between insemination and ovulation is thought to directly influence the sex of the offspring. In experimental breeding of rats the percentage of male offspring as compared to the female has been increased from a normal of 100.0 per cent to percentages varying from 149 to 255. This was accomplished by delaying insemination until varying hours after the expected time of ovulation; the greater the time interval after ovulation, the greater was the percentage of males. An analysis of over 65,000 pairs of dizygotic twins has revealed in each year's group approximately 27 per cent more like-sexed than unlike-sexed pairs. It is felt that this constant surplus, inconsistent with chance alone, results from inseminations occurring both early and late in the fertility period. The exhibit is comprised of charts and diagrams based on the results of the experimental breeding and the statistical analysis of twins.

WILLIAM C. KEETTEL, J. H. ALLEN and LUCIANO BARRERE, University Hospitals, Iowa City, Iowa:

Obstetric Penicillin Prophylaxis: Consecutive ward obstetric patients were given 600,000 units of penicillin intramuscularly at the onset of labor and 300,000 units every 24 hours thereafter until delivery, and an additional dose of 300,000 units 24 hours after the last antepartum dose. Private and part-pay patients served as controls. Maternal temperatures were taken by mouth every four hours and the morbidity standards of the American Committee on Maternal Welfare were utilized. Cervical cultures were taken usually some days before the onset of labor. Conjunctival cultures were made immediately after birth and prior to local application of prophylactic agents in control cases. Babies of mothers receiving penicillin ante partum received no ophthalmic prophylaxis. The control babies were given silver nitrate instillations in the right eye and penicillin ointment (100,000 units per gram) in the left eye. Conjunctival cultures were repeated after 24 hours in all cases.

H. E. NIEBURGS, E. R. PUND, HOKE WAMMOCK, University of Georgia School of Medicine, Augusta, Ga.:

Diagnosis of Preinvasive Carcinoma of Cervix Uteri: The material presented is based on the routine screening of the 10,000 women in whom endocervical films were made for the early detection of cancer. The differential diagnosis of preinvasive and invasive cancer of the cervix and endometrium are illustrated. Special attention is drawn to the specific cells shed from preinvasive cancer and those from invasive cancer showing their difference in morphology.

Section on Ophthalmology

The section exhibit committee of the Section on Ophthalmology consists of Georgiana D. Theobald, Oak Park, Ill., chairman; Edwin B. Dunphy, Boston, and Phillips Thygeson, San Jose, Calif.

K. W. ASCHER, W. M. SPURGEON and JEAN SCHUFF, College of Medicine, University of Cincinnati, Cincinnati:

Hydrodynamics of the Aqueous Veins: The influence of number, width and eccentricity of the cross section of the canal outlets is considered, and their bearing on the pressure inside the canal of Schlemm evaluated. Histologically, the largest outlets are located where the biomicroscopically visible aqueous veins are found. In glaucomatous eyes, the clear stream in the aqueous veins is not longer, wider or stronger than in aqueous veins of eyes with normal intraocular pressure. More pressure must be exerted on the eyeball in order to increase the aqueous flow in aqueous veins which derive from narrow outlets than in those originating from wide outlets. Spontaneous changes in the blood content of aqueous veins precede pressure changes in eyes suffering from primary simple glaucoma. In one eye, shortly after recovery from its first glaucomatous attack, an obstruction of a canal outlet has been histologically verified. After iridencleisis, aqueous veins often disappear, particularly if the eye pressure has been definitely reduced.. Both the gonioscopic and the refraction-correcting contact lenses produce characteristic changes in aqueous veins and in the canal of Schlemm.

M. W. NUGENT and KEVIN M. TUOHY, College of Medical Evangelists, Los Angeles, Calif.:

The Corneal Lens—Theory and Application: The exhibit shows the fitting technic of the Corneal Lens— a new type of plastic contact lens which has no scleral flange and requires no accessory foreign solution.

BRITTAIN F. PAYNE, JOSEPH H. KRUG and EDGAR B. BURCHELL, New York Eye and Ear Infirmary, New York:

Pathology of the Eye—New Technic for Preparations: The exhibit presents gross specimens of eyeballs divided meridionally which show various forms of pathology. Histologic sections, stained with hematoxylin and eosin, also show the same or similar disease processes.

A. L. KORNZWEIG, Home for Aged and Infirm Hebrews of New York City, New York:

Pathology of the Eye in Old Age: The eyes of inmates of the Home for Aged and Infirm Hebrews of New York City are examined periodically. Most of these patients are from 70 to 90 years old. Postmortem examinations of 120 consecutive eyes were done over a period of five years. The pathologic changes in these eyes were noted and the frequency of the occurrence of the typical pathology was classified. Many unusual findings were also listed, even though they occurred in only individual cases. Thus a comprehensive study of the eye in old age, clinically and pathologically, was obtained. The emphasis in the exhibit is on the pathology of the eye in old age. Enlarged photomicrographs of the eye, showing the typical and the unusual findings, are shown.

FREDERICK H. THEODORE, Mount Sinai Hospital, New York:

Office Bacteriology of the Eye: The purpose of this exhibit is to demonstrate the ease and feasibility of performing laboratory procedures in routine office practice, and to show their value in the diagnosis and treatment of external diseases of the eye. Special emphasis is placed on the practical aspects of slide diagnosis and culture methods. Numerous color photomicrographs of stained slide preparations obtained from illustrative cases are exhibited in specially designed viewing boxes. Bacteriologic diagnosis will be correlated with the use of newer therapeutic agents such as the antibiotics and sodium propionate.

DAN M. GORDON, The New York Hospital-Cornell Medical Center, New York:

Kodachrome Studies of the Ocular Fundus: Transparencies show a broad variety of eye diseases with emphasis on subjects of general interest.

DONALD J. LYLE and Frank H. MAYFIELD, Cincinnati:

Cerebral Angiography Related to Ophthalmology: The exhibit visualizes the cerebral vascular tree, both arterial and venous, in the normal and pathologic states by use of contrast mediums injected into the arterial system. Drawings of the visual and oculogyric systems with their blood supply are shown. Roentgenograms and diagrammatic sketches together with a brief history of the cases are used to demonstrate various types of vascular lesions affecting the visual and oculogyric systems.

PETER C. KRONFELD, ROY O. RISER and JOHN T. PARKER, University of Illinois College of Medicine, Chicago:

Glaucomatous Excavations: The exhibit shows the ophthalmoscopic appearance of the disc, recorded in stereoscopic color photographs and amateur sketches, correlated with the visual field defect in various types of glaucoma.

Section on Laryngology, Otology and Rhinology

The representative to the Scientific Exhibit from the Section on Laryngology, Otology and Rhinology is James B. Costen, St. Louis.

ARTHUR L. JUERS, RAYMOND CARHART, GEORGE E. SHAMBAUGH JR., E. L. DERLACKI and PAUL A. CAMPBELL, Northwestern University Medical School, Chicago:

Deafness and Its Management: A brief résumé is made of the present testing technics used to diagnose deafness, to measure its degree and to determine the appropriate treatment and audiologic management. A method of closing tympanic perforations is described together with a summary of results. The essential features of the Northwestern fenestration technic are briefly given, together with end results obtained by this technic. The problems and clinical entities which have been discovered as a result of the new "controlled speech" technics for testing are reviewed. Emphasis is given to phonemic regression, a special problem found frequently in presbyacusis.

SAM E. ROBERTS and FRANK S. FORMAN, Kansas City, Mo.:

Direct Laryngoscopy—Simplified Technic: The exhibit shows mechanical laryngeal head supports and a new self-retaining dual distal lighted laryngoscope. Manikins show different types of laryngeal lesions, so arranged that each visitor pass the self-retaining laryngoscope with dual distal lighting on each of the manikins. The anesthetic technic is described.

J. BROWN FARRIOR and R. A. BAGBY, Tampa Municipal Hospital, Tampa, Florida.

Ear Surgery: The exhibit consists of a series of temporal bone dissections with accompanying illustrations and legends to demonstrate the indications and technic of ear surgery. These specimens illustrate simple mastoidectomy, radical mastoidectomy, modified radical mastoidectomy, fenestration operation, facial nerve surgery, petrous apicectomies and surgical treatment of Ménière's disease. Accompanying charts describe further details.

JULIUS LEMPERT and DOROTHY WOLFF, Lempert Institute of Otology, New York:

Modern Temporal Bone Surgery: The exhibit deals with (1) the Bone-Dust-Free Lempert Fenestra Nov-Ovalis Operation for the restoration of practical hearing in clinical otosclerosis; the research and histologic observations which led to the high percentage of permanently patent fenestras obtainable today with this surgery, and the pathogenesis of otosclerosis and theory of its onset and progressive development; (2) Lempert Decompression operation for hydrops of the endolymphatic labyrinth in Ménière's disease, and the research and histology which led to its development; (3) Lempert Endaural Subcortical Mastoidotympanectomy for the cure of chronic persistent suppurative otitis media, and specially prepared cadaver specimens depicting each step in the surgery, with magnification of the surgical field.

A. C. STUTSMAN, Washington University School of Medicine, St. Louis:

Technic of Tracheotomy: The exhibit deals with the technic of tracheotomy by photographs and descriptive matter. Methods of avoiding complications are described.

Section on Pediatrics

The representative to the Scientific Exhibit from the Section on Pediatrics is Albert V. Stoesser, Minneapolis.

HAROLD W. DARGEON, Children's Tumor Registry, Memorial Hospital, New York:

Control of Cancer in Childhood: Photographs and charts illustrate the importance of cancer as a major child health problem, the familial tendency in certain varieties of childhood cancer, the variability in the natural history of certain types of child cancer and the problems of diagnosis, management and evaluation of end results.

AIMS C. MCGUINNESS and CECILIA Y. WILLARD, Children's Hospital of Philadelphia, Philadelphia:

Whooping Cough—Diagnosis, Prevention and Treatment: The exhibit shows the bacteriologic diagnosis of whooping cough, the use of the agglutinogen skin test in detection of susceptibility to whooping cough and prevention and treatment with hyperimmune human serum.

ALBERT E. SOBEL and BENJAMIN KRAMER, Jewish Hospital of Brooklyn, Brooklyn.

Studies with Aqueous Dispersions of Fat-Soluble Vitamins: Fat-soluble vitamins in oily mediums are poorly absorbed in newborn and premature infants and in diseases such as celiac syndrome, obstructive jaundice, hypothyroidism and sprue. When the vitamins are administered in aqueous dispersion they are well absorbed. This was shown for both vitamin A and E. The transfer of vitamin A to milk both in human beings and in experimental animals (rat) is far more efficient with aqueous dispersions than with oily solutions. The liver stores in normal rats are about three times as high with aqueous dispersions as with the same vitamin A in oil. Conditions for the intravenous injection of aqueous dispersions of fat-soluble vitamin were developed and tested in the rabbit with no pathologic effects.

LAURENCE J. LINCK, National Society for Crippled Children and Adults, Chicago:

A Program for the Physically Handicapped: Various phases of the rehabilitation program are shown, including physical therapy, occupational therapy, speech, hearing rehabilitation and special education.

BENJAMIN M. GASUL, EGBERT H. FELL, HANS POPPER, MAURICE LEV, WILLIAM MAVRELIS, CARL B. DAVIS JR., RAUL CASUS and HANS HARTENSTEIN, Hektoen Institute of Medical

Research and Children's Division of Cook County Hospital, and the University of Illinois College of Medicine, Chicago:

Congenital Heart in Clinical Medicine: The principles of the clinical diagnosis of congenital heart diseases are demonstrated, including roentgen ray, fluoroscopy, esophography, electrocardiography, stethography, sphygmography, angiocardiography and cardiac catheterization. The material consists of approximately 300 cases, studied intensively during the past two years. Clinically significant examples are exhibited. The physical data are correlated with the pathologic findings.

G. Carlisle Adams and Grant Taylor, Duke University School of Medicine, Durham, N. C.:

Tinea Capitis in North Carolina: The exhibit consists of photographs of lesions of tinea capitis, map with plotted incidence of tinea capitis in North Carolina, statistical breakdown of incidence in county and one city (Durham) as to race, grade, etc. Microsporum audouini and Microsporum canis are contrasted. Cultures of these organisms are included with microscopic demonstration. Treatment of the disease is discussed.

Martin M. Maliner and Sol D. Amsterdam, Brooklyn and Henry Borow, Bound Brook, N. J.:

Fluoroscopic Anatomy of Congenital Heart Defects: Models representing different congenital defects of the heart are so placed behind screens that they cast shadows similar to shadows on the fluoroscopic screen. Charts and drawings deal with the clinical differential diagnosis of the various lesions. The cardiac models will include the normal heart, patent ductus arteriosus, large patent interventricular septum, aortic coarctation, tetralogy of Fallot, patent interauricular septum, transposition of great vessels, Eisenmenger complex, tricuspid stenosis and truncus arteriosus.

Harvey Blank, Lewis L. Coriell, Gertrude Henle, Werner Henle, T. F. McNair Scott and M. Michael Sigel, The Childrens' Hospital of Philadelphia, Philadelphia:

Virus Diseases: The exhibit presents the various functions of the virus diagnostic research laboratory using for illustration observations made during two and one-half years of actual operation. 1. The laboratory diagnosis of virus infections in individual patients by: (*a*) isolation of virus; (*b*) serologic procedures; (*c*) histologic study of biopsy material for characteristic inclusion bodies (skin virus diseases), and (*d*) electron microscopic demonstration of characteristic virus particles, and in addition, characteristic clinical pictures of these virus diseases of the skin. 2. Functions concerning community health: (*a*) the analysis of outbreaks in families (herpes), schools (mumps and influenza) and industrial plants (Q fever); (*b*) the search for the source of infection; (*c*) epidemiologic surveys in order to determine the status of susceptibility in a given population, and (*d*) study of the effect of preventive measures (influenza). 3. Research toward establishment and improvement of diagnostic procedures.

Section on Experimental Medicine and Therapeutics

The representative to the Scientific Exhibit from the Section on Experimental Medicine and Therapeutics is Robert W. Wilkins, Boston.

Milton Schlachman and David Scherf, New York Medical College, New York:

Effect of Sympathicolytic Drugs on the Abnormal Electrocardiogram: The normalization of functionally inverted T waves can be produced by ergotamine preparations; therefore it is claimed that the inversion is due to sympathicotonia and that these drugs will differentiate the functional from the organic abnormal electrocardiogram. However, it was possible to normalize inverted T waves with ergotamine preparations in patients with organic heart disease and also to reproduce these results in patients who were first prepared with tetraethylammonium chloride, so that an autonomic ganglionic blockade occurred, indicating that the ergotamine preparations have a direct action on the coronary arteries or myocardium and not by virtue of their sympathicolytic property as is claimed.

James Mallory Carlisle, Westfield, N. J., and Gurth E. Carpenter, Los Angeles County Hospital, Los Angeles:

Vitamin B_{12}: Photomicrographs illustrate response of bone marrow and peripheral blood to administration of vitamin B_{12} to patients with macrocytic anemias. Charts depict hematologic and clinical progress.

Raymond W. Cunningham, A. C. Dornbush, B. M. Duggar and B. K. Harned, Lederle Laboratories Division, American Cyanamid Company, Pearl River, N. Y.:

Studies on Aureomycin: A presentation of charts and posters showing the isolation of aureomycin, a new antibiotic, together with reports on the pharmacology, bacteriologic studies and other laboratory studies. Photographs show the nature of the antibiotic as well as cases which have been presented in published reports.

William J. Darby and Edgar Jones, Vanderbilt University School of Medicine, Nashville, Tenn.:

The Newer Hemopoietic Vitamins (Vitamin B_{12}, Animal Protein Factor, and Pteroylglutamates): A summary is presented of the known hematologic and other physiologic effects in the human of vitamin B_{12}, animal protein factor (APF) and the pteroylglutamates. Illustrative data are shown on patients with sprue, pernicious anemia, nutritional macrocytic anemia, pernicious anemia of pregnancy and related hematologic disorders.

Henry Dolger, The Mount Sinai Hospital, New York:

Vascular Damage in Diabetes Mellitus: Accelerated arteriosclerosis is characteristic of diabetes mellitus. Generalized degenerative changes affect the capillaries, particularly the vessels of the retina, kidney and vasa vasorum. This damage can be found in varying degrees of severity in every instance of diabetes mellitus of some duration. Within twenty-five years of onset of diabetes, 200 patients reveal retinopathy in 100 per cent, hypertension and albuminuria in 50 per cent. Neither the age of onset nor the severity of diabetes nor the control of glycosuria prevents the premature development of vascular degeneration.

Richard Kovacs, New York Polyclinic Medical School, New York:

From Amber to Radar—The Evolution of Electrotherapy and Light Therapy: Photographs, charts and diagrams show progress from the observation of simple frictional and magnetic phenomena by Thales, 600 B.C., and Gilbert, 1600 A.D., on to the period of static electricity—Abbé Nollet and Benjamin Franklin. The discoveries of the chemical and electromagnetic generation of electricity by Galvani, Volta, Faraday, enabling the pathfinding work on the physiology of muscles and nerves by Duchenne, DuBois Reymond and others are presented, as well as the discoveries of high frequency electricity by Maxwell Clark, Henry, Herz and d'Arsonval leading to medical and surgical diathermy. The new era of electronics and radar is shown; also the progress of heliotherapy from Avicenna, Aesculapius and Hippocrates to Newton, Ritter, Herschel and Kirchhoff to Finsen, Rollier, Bernhard and Hess.

David Lehr, New York Medical College, Flower and Fifth Avenue Hospitals, New York:

Sulfonamide Mixture Therapy: The exhibit illustrates (1) the relative merits and drawbacks of sulfonamide drugs available at present for use in mixtures, (2) the factors which determine the selection of appropriate drugs in optimum proportions and (3) a new concept of sulfonamide allergy. Sulfadiazine and sulfamerazine qualify for first and second place, respectively, as mixture components. Sulfathiazole, sulfapyrazine, sulfamethazine and sulfacetimide deserve attention as possible third and fourth members of a combination.

Arthur E. MacNeill, Alan Mather and William L. McLaughlin, Dartmouth Medical School, Hanover, N. H.:

A Dialyzer of Great Adaptability: A new dialyzer design is presented. The theoretical basis for its novel features is shown and its compactness, adaptability and effectiveness presented by working models, charts and diagrams. A new type of blood pump, without internal valves, is demonstrated. The potential usefulness of this device in the removal of substances from the body in renal and cardiac failure, in various intoxications and in metabolic and neoplastic diseases is suggested.

Paul C. Aebersold and Edwin A. Wiggin, Isotopes Division, United States Atomic Energy Commission, Oak Ridge, Tenn.:

Radioisotopes—What They Are, How They Are Made in the Pile and How They Are Used Medically: The exhibit consists of diagrams, charts, photographs and pile model to indicate what isotopes are, and the terminology peculiar to isotopes; how they are made in the pile, shown graphically by sketches and photographs, and how they are used medically, shown graphically by a series of sketches on diagnosis, therapy and tracer studies.

William Dameshek, Marvin L. Bloom, Louis Weisfuse and Milton Freedman, Joseph H. Pratt Diagnostic Hospital and Tufts College Medical School, Boston:

Chemotherapy of Leukemia and Leukosarcoma: Chemotherapeutic methods offer the possibility of altering the enzymatic functions of various types of proliferating white cells and thus attacking such proliferative disorders as lymphosarcoma, Hodgkin's disease, multiple myeloma and leukemia. Nitrogen mustard has been particularly successful in treatment of Hodgkin's disease, in certain cases of lymphosarcoma, and in other reticulum cell proliferations. Sk-136, a nitrogen mustard derivative, is of value in certain cases of chronic myelocytic leukemia and to lesser extent in acute monocytic leukemia. Urethane has proved of value in the treatment of chronic myelocytic leukemia, particularly in prolonging roentgen ray-induced remissions. The folic acid antagonists have proved useful in inducing remissions in about one third of the cases of acute and subacute leukemia treated. These various chemotherapeutic agents, although not curative, demonstrate not only definite therapeutic effects, but a specificity for certain proliferating white cells which gives hope for future more potent agents.

Virginia Kneeland Frantz, Sidney C. Werner and Edith H. Quimby, Presbyterian Hospital and Columbia University College of Physicians and Surgeons, New York:

Radioactive Iodine—Its Use in the Diagnosis and Treatment of Thyroid Disease: The exhibit presents an analysis of diagnosis and therapy of hyperthyroidism with radioactive iodine. A similar presentation is shown of diagnosis and therapy in thyroid cancer correlated with pathologic findings and radioautographs.

Section on Pathology and Physiology

The representative to the Scientific Exhibit from the Section on Pathology and Physiology is Alvin G. Foord, Pasadena, Calif.

Charles W. Hock, Lester L. Bowles, V. P. Sydenstricker and W. Knowlton Hall, University of Georgia School of Medicine, Augusta, Ga.:

Ocular Changes in Nutritional Deficiencies in the Rat: The vascularization and other corneal changes resulting from deficiencies of each of the essential amino acids, protein, vitamin A, riboflavin and pantothenic acid in the rat are illustrated with photographs of injected corneas. The development of capillaries and other corneal changes in methionine deficiency are illustrated with photomicrographs. The development of cataracts in deficiencies of histidine and phenylalanine in the rat is shown with photographs of eyes and of dissected lenses. The corneal and lenticular changes in the deficiencies mentioned are summarized.

Israel Davidsohn, Kurt Stern and Chiyo Kashiwagi, Mount Sinai Medical Research Foundation and Hospital and Chicago Medical School, Chicago:

Infectious Mononucleosis: Infectious mononucleosis may present serious diagnostic problems. Many of these problems can be readily solved with the help of the differential test. The material presented is based on a serologic study of over 200 patients with infectious mononucleosis. The exhibit deals with an analysis of clinical findings and of diagnostic problems, with technical aspects of the presumptive and differential tests, with their specificity and sensitivity. Summaries of experimental investigations are included on the absorption with guinea pig kidney antigen, on the rapid centrifuge technic, on the effect of diluents and of time and temperature. Pathologic and hematologic findings are presented.

Sylvan E. Moolten and Leo Vroman, St. Peter's General Hospital, New Brunswick, N. J.:

Role of Blood Platelets in Thromboembolism: A theory of thrombosis is presented stressing platelet adhesiveness and endothelial "wettability." Platelet count and adhesiveness are increased by tissue injury and by thrombocytosin found in fat tissue, and are diminished by thrombocytopen, formed in the spleen. Postoperative thrombosis may be due in part to thrombocytosin,, mobilized by trauma, in part to loss of normal endothelial nonwettability in veins by prolonged pressure or other slight injury. Clumping of adhesive platelets on a wettable endothelial surface builds up a plug (white thrombus), which arrests the flow of blood in that vascular segment. Clotting en masse of the stagnant blood (red thrombus) is accelerated by platelet breakdown in the white thrombus. The principles of endothelial nonwettability and wettability are illustrated. The glass wool filter test for platelet adhesiveness is demonstrated, also its application in preclinical detection of thrombosis and other conditions.

Silas M. Evans and Walter Zeit, Marquette University School of Medicine, Milwaukee.

Tissue Reactions to Physical Forces: The exhibit presents the ability of fibrous tissue to protect against abnormal energy releases, particularly those of motion and electricity; linear tensile strength and thermoelectric resistance studies; the ability of these energy states in pure form to produce fibrous tissue reaction; tissue reactions to galvanic current and mechanical stresses; the means whereby energy is liberated within tissues in pathologic states characterized by fibrous reaction through a mechanism known as piezoelectricity; the piezoelectric properties of fibrogenic dusts are correlated with tissue reactions and compared to the absence of piezoelectric properties and tissue reactions in nonfibrogenic dusts. Dusts never before studied and containing no silica were selected because of known piezoelectric activity and their fibrogenic properties are demonstrated. This is correlated with clinical silicosis. Tissue reactions demonstrating the electro-mechanical pattern of cholesterol correlated with the theoretic description of the pathogenesis of arteriosclerosis are demonstrated.

Sidney A. Gladstone, New York Polyclinic Hospital, New York.

Sponge Biopsy—A New Method in Cancer Diagnosis: The method consists of rubbing a suitable (gelatin) sponge over an ulcer or mucous membrane to absorb tissue juice, cells and particles of tissue. Sponge and absorbed material are fixed in formaldehyde, dehydrated, embedded in paraffin, cut, stained and examined microscopically. The exhibit includes charts describing the technic, photographs illustrating instruments and sponges and manner of applying them, charts of illustrative cases, enlarged photomicrographs of the biopsies and tables summarizing the results.

George Crile Jr., J. Beach Hazard and E. W. Rumsey, Cleveland Clinic, Cleveland:

Thyroiditis: Transparencies show gross and microscopic pathology, also clinical features of various types of thyroiditis.

Joseph M. Hill, Sol Haberman, Allen F. Reid and Kenneth P. Wittstruck, William Buchanan Blood Center, Baylor Hospital, Dallas, Texas:

Physical Chemical Studies on Rh Antibodies: Charts and graphs illustrate different orders of reactivity of antibodies and the distribution of these varieties of antibodies in the different plasma protein fractions obtained by a new fractionation technic. A working model of the fractionation apparatus is shown.

Carroll L. Birch and Louis R. Limarzi, University of Illinois College of Medicine, Chicago:

Cytologic Changes in Blood and Bone Marrow Induced by Therapy: The exhibit presents normal bone marrow cytology, bisected bones showing distribution of red and yellow marrow and sternal puncture needle in situ in sternum, and blood and bone marrow in anemic leukemic and splenomegalic states before and after therapy with liver extract, folic acid, iron, arsenic, folic acid antagonists, P^{32}, thyroid extract, high protein diet, etc.

Thomas J. White, Carroll M. Leevy, Angelo M. Gnassi and H. Preston Price, Jersey City Medical Center, Jersey City, N. J.:

Needle Biopsy of the Liver in Evaluation of Diagnosis and Therapy of Liver Disease: The exhibit shows (1) general features of needle biopsy of the liver including limitations, contraindications, indications in 400 needle biopsies, general preparations; (2) technic of needle biopsy of the liver demonstrated with moulages; (3) correlation of clinical features, function studies and histology in establishing an adequate diagnosis; (4) illustrative cases showing value of needle biopsy in diagnosis and therapeutic evaluation, and (5) needle biopsy slide demonstration.

O. J. Pollak, Quincy City Hospital, Quincy, Mass.:

Development of Atheroma—An Acute Colloidal Phenomenon: Subintimal cholesterol deposits develop in rabbits on intravenous injection of colloidal cholesterol although blood cholesterol levels do not rise to the height encountered in experimental alimentary hypercholesterolemia. Atheroma-like vascular alterations are seen in rabbits killed immediately on completion of a single intravenous injection of cholesterol. These observations lend support to the theory that atheromatosis is caused by intramuscular precipitation of coarsely dispersed colloids. They open the avenue for prevention and prophylaxis of experimental cholesterol atheromatosis.

James L. Southworth and James O. Davis, United States Marine Hospital, Baltimore:

Renal Function and Morphology in Hypertensive Vascular Disease—Preliminary Study: Renal function has been studied in hypertensive patients by clearance methods (inulin and diodrast® clearance); biopsies of the kidneys of the same patients were obtained at operation. Whereas at the extremes there is correlation between morphology and function, considerable reduction in renal blood flow and glomerular filtration rate may exist with little or no structural change. Factors other than vascular sclerosis appear to be operative in increased renal vascular resistance observed in a substantial number of cases. How adequately renal biopsy represents the status of the kidney is shown. Histologic sections are available for demonstration.

Section on Dermatology and Syphilology

The representative to the Scientific Exhibit from the Section on Dermatology and Syphilology is Francis W. Lynch, St. Paul.

Helen Ollendorff Curth, Columbia University, College of Physicians and Surgeons, New York:

Behcet's Syndrome—Aphthosis: Charts, posters and photographs describe Behcet's syndrome, which is a systemic disease characterized by recurrent attacks of uveitis (iridocyclitis) with hypopyon, oral aphthae and genital ulcerations. The three classic signs and the mode of the recurrent attacks are shown. Cases with any two of the three classic signs are considered abortive forms of the disease. The genital manifestation in women is the same as that described by Lipschütz as ulcus vulvae acutum. Associated signs such as a high degree of nonspecific cutaneous hypersensitivity, erythema nodosum and various inflammatory processes of the skin, muscles, joint, gastrointestinal tract, etc., have been observed in many patients with the syndrome. Laboratory examinations, treatment, possible causes of the disease and the differential diagnosis are discussed.

Harry M. Robinson Jr. and Fred R. McCrumb Jr., University Hospital, Baltimore:

Comparative Analysis of the Muco-Cutaneous-Ocular Syndromes: The exhibit presents a comparative analysis of a symptom complex which consists primarily of oral, genital and ocular lesions, and which is known in the literature as Behcet's disease, Reiter's disease, ectodermosis erosiva pluriorificialis and Stevens-Johnson disease. In the opinion of the exhibitors these syndromes are variants of erythema multiforme, and it is their belief that a comparative analysis of the literature supports this theory. Cases are presented which show features of all these syndromes.

E. L. Laden and D. A. Wallace, University of Chicago School of Medicine, Chicago:

Procaine Eczema—A Common Occupational Disease of Dentists: Data gathered by the American Dental Association indicate that over 1,000 dentists in the United States have chronic dermatitis of the hands, due to a large number of cases to hypersensitivity to local anesthetic. Nine dentists with proved hypersensitivity to local anesthetics were studied and a typical clinical picture is described. Sensitivity was found to be confined to procaine and anesthetics of closely related chemical configuration, and no sensitivity was present to anesthetics of different chemical configuration. A logical method of treating this condition is provided by these results.

George M. Lewis, M. Jeff Davis and George A. Waldriff, New York:

Antihistamine Therapy in Dermatology: The value of the antihistamine drugs in the treatment of urticaria is well established. It has been shown also that the local application of one of the available drugs has contributed to the treatment of some forms of idiopathic pruritus. Intensive search for further uses of the various commercial products has shown that other apparently unrelated dermatoses may be favorably affected by either the internal or external use of these drugs. An incidence of side reactions of nearly 20 per cent makes the indiscriminate use of these drugs undesirable. Epidermal sensitization is rare as shown by a comprehensive series of patch tests to eight different antihistamine drugs. It is concluded that the presently available commercial antihistamine compounds have a most useful though limited place in the treatment of skin diseases.

Claire L. Straith, Wm. G. McEvitt, Ord C. Blackledge, Morrison Beers and Richard E. Straith, Straith Clinic for Plastic Surgery, Detroit:

Plastic Surgery in Skin Lesions: The exhibit shows various skin lesions and their treatment by excision, pedicle flaps, skin grafts, etc. The importance of careful excision of even small skin lesions which enlarge or fail to heal is emphasized. A surprising number of such lesions prove to be malignant. The treatment of hairy moles, purple birth marks, rhinophymas, powder marks, tattoos, brush burns and many other lesions is considered.

Louise E. Tavs and Frederick J. Szymanski, Chicago:

Extragenital Syphilitic Chancre: Illustrations of proved extragenital syphilitic chancres in many and varied sites are shown and the incidence of extragenital syphilitic chancres in various locations on the body are presented. A survey of the diagnostic procedures applicable in this diagnosis is included, with the histopathologic features of chancre biopsy, direct and lymph node puncture dark field technics and features of serologic reactions for syphilis.

Maurice Sullivan and Marion Friedman, Medical Service, United States Marine Hospital, Baltimore:

Treatment of Condylomata Acuminata with Resin of Podophyllum: The exhibit consists of photographs portraying penile and perianal condylomata acuminata before topical application during regression, and after treatment. It attempts to emphasize the type of condylomas suitable for this therapy and the possible reactions which can occur. The similar action of podophyllotoxin and colchicine on condylomas is shown. A pictorial description of the cytologic action is presented.

Arnold A. Zimmermann and Theodore Cornbleet, University of Illinois College of Medicine, Chicago:

Development of Epidermal Pigmentation in the Negro Fetus: A graphic and microscopic demonstration of the development of dendritic melanoblasts in the fetal epidermis of the Negro is presented. All stages of the differentiation of melanin-producing cells from the third fetal month to birth are shown.

J. K. Howles, V. M. Henington and Frederick Grieshaber, Louisiana State University School of Medicine, New Orleans:

Observations on Dermatoses in the Negro: An exhibit of dermatologic phenomena in which racial characteristics are of peculiar significance. The incidence of certain dermatoses frequently considered as nonexistent in the Negro are shown. An effort is made to clear up much of the misunderstanding concerning the frequency of many dermatoses occurring in the Negro.

Section on Nervous and Mental Diseases

The representative to the Scientific Exhibit from the Section on Nervous and Mental Diseases is A. B. Baker, Minneapolis.

Lewis J. Pollock, Benjamin Boshes, Herman Chor, Isidore Finkelman, Meyer Brown, Alex J. Arieff, Joseph G. Kostrubala and Louis B. Newman, U. S. Veterans Administration Hospital, Hines, Ill.:

Injuries to Spinal Cord and Cauda Equina: The exhibit includes results of such management including treatment of bed sores, genitourinary complications, physical medicine and involvement of sympathetic nervous system.

J. M. Sanchez-Perez, University of Southern California Medical School, Los Angeles:

Kymovolchron Recorder with Starting Syringe—In Controlled Serial Roentgenography: This apparatus is to be used mainly with the automatic seriograph. It is equipped with a starting syringe and records graphically the amount of opaque material used in angiography. It also records accurately the volicity and pressure of the injection as well as the interval between the roentgen ray exposures. It is electrically connected in such a way that it starts the automatic seriograph immediately after the completion of the injection and eliminates the chance of error due to human factor.

Charles Pomerat, Jack R. Ewalt and Joseph Painter, University of Texas School of Medicine, Galveston, Texas:

Studies on Nervous Tissue Cultivated in Vitro: Spinal cord from chick embryos has been used to study the toxicity of central nervous stimulants and depressants as well as the effect of anti-organ immune serums. Studies on cells from biopsies of the human adult brain obtained during lobotomies from schizophrenic subjects are also presented.

Francis C. Grant, Hospital of the University of Pennsylvania, Philadelphia:

Neurosurgical Lesions of the Brain and Spinal Cord: The exhibit presents pictures of the operative fields seen during the exposure of neurosurgical lesions of the brain and spinal cord. Whenever possible the roentgen changes and other diagnostic features which help in localization are included. Some 20 cases of various types of tumor involving the brain and spinal cord are shown with characteristic changes frequently seen in the type of tumor exposed.

Joe R. Brown, Andrew J. Leemhuis and Louis C. Jensen, Veterans Administration Hospital, Minneapolis:

Retraining Therapy of Neurologic Disabilities: The exhibit illustrates the principles, methods of treatment and results of treatment of disabling neurologic disabilities, demonstrating how and to what extent these technics can be utilized by the general practitioner. The application of passive movement, active motion, resistance exercises, ambulation exercises, self-care activities, social and vocational training in the treatment of hemiplegia, ataxia, multiple sclerosis, parkinsonism, flaccid paralysis, and paraplegia are described. Patients are used to demonstrate the application of therapeutic technics.

William S. Collens, A. M. Rabiner, L. C. Boas, J. D. Zilinsky, N. D. Wilensky and J. J. Greenwald, Maimonides Hospital, Brooklyn:

Diabetic Neuropathy: The exhibit is concerned with a graphic presentation of the disturbance in the metabolism of the antineuritic fractions of B complex, a photographic display of muscle atrophies occurring in diabetic neuropathy, a demonstration of methods for quantitating neuropathies and a presentation of methods for effecting reversibility of this condition. The results of a study in 300 persons with diabetes is presented. A differential diagnosis of ischemic neuritis and metabolic neuropathy is stressed.

Section on Preventive and Industrial Medicine and Public Health

The representative to the Scientific Exhibit from the Section on Preventive and Industrial Medicine and Public Health is Paul A. Davis, Akron, Ohio.

Jean Spencer Felton and Lydia L. Bredig, Oak Ridge National Laboratory, Oak Ridge, Tenn.:

Mental Health in Industry: The exhibit presents the rationale and method of a counseling program now in effect at the Oak Ridge National Laboratory. The interrelation of somatic complaints and psychologic factors is shown with their effect on industrial output, employer and employee relations and the manner in which these problems are handled. The exhibit shows the type and variety of presenting complaints, the selection of those employees who present personal difficulties which interfere with work efficiency, such as those of work relations, marital problems and tension difficulties, and who are suitable for counseling. The goal of counseling is to bring to conscious awareness those patterns of behavior and attitude which interfere with functioning and to direct constructive energies toward more productive channels. The work of such a program on industrial output and work relations is presented.

Hurley L. Motley, Leonard P. Lang, Peter A. Theodos and Burgess Gordon, Barton Memorial Division, Jefferson Medical College Hospital, Philadelphia:

Pulmonary Function Impairment in Anthracosilicosis: The nature of the breathing impairment has been studied by physiologic methods in over 180 anthracite and 35 bituminous coal miners with respiratory complaints after prolonged exposure to dust (20 to 40 years). Pulmonary function impairment may be due to: (1) decreased ventilation (maximal breathing capacity and vital capacity), (2) increased residual air (emphysema), (3) decreased alveolar perfusion and (4) poor distribution (unequal alveolar aeration). Various degrees of involvement of one or more of the four factors may occur. Roentgenologic, electrocardiographic and clinical findings have been correlated with the physiologic studies. No single test was satisfactory for correctly evaluating the impairment of pulmonary function. Information is presented for improving the rationale of therapeutics in this disabling disease.

Herman N. Bundesen, William I. Fishbein and Morton B. Andelman, Chicago Health Department, Chicago:

Control of Epidemic Diarrhea of the Newborn in Chicago: Charts and graphs show the organization and administration of the Chicago Health Department unit assigned to the control of this disease, the methods of control of epidemic diarrhea of the newborn, the number of deaths of epidemic diarrhea before and after present control methods (1938) were established and the equipment and physical setup of model nurseries and formula rooms.

O. A. Sander, Milwaukee:

Siderosis—A Benign Pneumoconiosis Due to Iron Fumes and Dusts: The exhibit presents a fifteen year series of periodic chest roentgenograms of five welders, steel cutters and grinders, along with the pathologic sections from an additional case. Additional films show differential diagnosis between siderosis, silicosis, stannosis, beryllium granulomatosis and miliary tuberculosis. The roentgen findings of siderosis are characterized by discrete nodular and stippled shadows due to iron oxide deposits in the perivascular lymphatics. Such iron pigmentation is entirely inert, with no resulting fibrosis, impaired lung function or increased susceptibility to tuberculosis or other infections. It is of significance only because of its frequent misdiagnosis as silicosis.

Thomas B. McKneely, C. L. Newberry and Josephine Buchanan, Office of Vocational Rehabilitation, Washington, D. C.:

Civilian Vocational Rehabilitation—Physical Medicine Phases: Physical medicine and related therapies are shown in sequences of lighted transparencies. Other services available to the disabled through the federal-state program of vocational rehabilitation for civilians are enumerated and explained. These services include medical examinations, hospitalization, prosthesis, psychologic testing, counseling and guidance, training, vocational selection and placement and postemployment adjustment.

James A. Wheeler, Axtell Clinic, Newton, Kan.;

Comparative Graphic Study of Western Equine Virus: A comparative study of western equine virus (James A. Wheeler) and St. Louis virus (Washington University; R. J. Blattner and J. V. Cooke) is presented. The exhibit shows the reservoir as found in these two separate studies and the vector transmission of the two virus diseases. In western equine virus it was found that 50 per cent of assassin bugs from rats' nests in pastures contained virulent western equine virus; the present theory is that the young gain their wings in the spring and fly to horses in the pasture, etc. With the proper influx of seasonal mosquitoes the stage is set for an epidemic. The work was done on the St. Louis virus in order to make this a comparative study with the work done on western virus to show a particular pattern of the transmission of these two particular viruses.

Wilhelm C. Hueper, National Cancer Institute, Bethesda, Md.:

Environmental Cancer Can Be Controlled: Causes and control of environmental cancer are presented. Known causes are depicted by a diagrammatic section through the human body showing organs, seven carcinogenic factors affecting them and four routes of exposure. Varied aspects of environmental cancer include radioactive substances and roentgen rays, hydrocarbons and solar rays. "Aromatic amines in a dye plant" deals with the carcinogenic focus and the percentage of cancer in carcinogenic operation, department, plant, county and state. The control of environmental cancer includes six factors.

H. S. Van Ordstrand, Cleveland Clinic, Cleveland, Joseph M. DeNardi, Lorain, Ohio, and Morris G. Carmody, Painesville, Ohio:

Berylliosis—Acute and Chronic Manifestations of Beryllium Poisoning: A nine year study of the toxic manifestation in workers exposed to beryllium and its compounds presents the findings in over 400 cases. In this group of cases all of the known forms of beryllium poisoning have been seen, among which were 90 instances of acute reaction including dermatitis, conjunctivitis, and skin ulcer, chronic pulmonary granulomatosis and the chronic skin granulomas. The exhibit includes the history and industrial hazard of the element beryllium and its compounds. Its various clinical manifestations are demonstrated.

George Papanicolaou, Joseph Skapier, Genevieve Bader, Roland Loeb, E. Leslie, Michael Deddish, Robert Sherman and Suzanne Howe, Strang Prevention Clinic, Memorial Hospital for Cancer and Allied Diseases, New York:

Early Cancer Detection: The exhibit illustrates some of the methods used for the detection of cancer, special attention being given to the female genital tract and to the lower bowel. The cytologic technic of detecting early carcinoma of the uterus is emphasized and examples of preinvasive carcinoma found by this method are given. The statistics cover the study of 17,000 patients and 40,000 smears for the years 1947 and 1948. The results of 7,500 routine sigmoidoscopic examinations are shown and the technics of patient preparation and examination are illustrated. A research study of 150 washings of the rectosigmoid mucosa is included with color transparencies showing the normal and malignant cytology. Instruments and technic of this examination are illustrated.

Robert A. Kehoe, F. R. Dutra, J. Cholak and E. J. Largent, Kettering Laboratory, College of Medicine, University of Cincinnati, Cincinnati, Ohio:

Beryllium: Beryllium is capable of producing two forms of pulmonary disease in man, acute pneumonitis and chronic pulmonary fibrosis with formation of specific granulomas. The effects on experimental animals indicate that the substance is highly toxic in the form of soluble salts, and relatively insoluble compounds given intravenously produce malignant tumors. The exhibit illustrates all of these phenomena.

Section on Urology

The section exhibit committee of the Section on Urology consists of John H. Morrissey, New York, chairman; Roger Barnes, Los Angeles; Earl Ewert, Cambridge, Mass., and John Dees, Durham, N. C.

Henry Sangree, Leonard D. Frescoln, Park Miller, Herbert Warres and Julius Taylor, University of Pennsylvania School of Medicine and Presbyterian Hospital, Philadelphia:

Urinary Calculi—Treatment, Prevention and Diagnosis: A summary is presented of the results of 50 patients on whom a critical and exhaustive study was made as to the cause of stone formation, including data on race, sex, age and diet. There is also shown the estimation of blood serum calcium and phosphorus values, bacteriologic studies, chemical analysis of stones, roentgen ray crystallography films of stone, atomic structure, section and study of the stone under the petrographic microscopic using a cross Nichols prism, demonstration of goniometer measurements. Prevention of crystine and uric calculi is discussed, with dietary regimen.

Jan H. Tillisch, J. E. Edwards and G. J. Thompson, Mayo Clinic, Rochester, Minn.:

Pathologic Basis of Impaired Renal Function in Surgical Diseases of the Kidney: The exhibit demonstrates the pathologic basis of the impaired renal function in such surgical diseases as polycystic kidney, pyelonephrosis, renal calculi and hydronephrosis by means of models of actual cases together with roentgenograms and gross photographs and microphotographs. Pertinent clinical features in the course of the diseases, laboratory data and roentgenograms are presented. In each of the aforementioned conditions an advanced stage of the diseases with severe impairment of renal function is compared with a less severe stage of the condition with little or no apparent impairment of renal function, in order to demonstrate the pathologic cause of renal failure in the severe type.

George E. Slotkin, Millard Fillmore Hospital and University of Buffalo School of Medicine, Buffalo, N. Y.:

Synergistic Treatment of Urinary Tuberculosis by Chemotherapy: The exhibit consists of electron microscopic photographs of the action of moogrol® on the tubercle bacillus, in preparing the same for treatment by streptomycin. In vitro photographs of the action of the oil, photographs of the series of guinea pigs under treatment and evaluation will be made of the clinical results in approximately 30 cases in which combined treatment—moogrol® and streptomycin—has been used.

W. W. Scott, Willard E. Goodwin and Robert D. Sloan, James Buchanan Brady Urological Institute, Baltimore:

Nervous Control of Renal Circulation: Direct and reflex nervous control of the renal circulation of the rabbit, cat, dog and monkey is demonstrated through the medium of black and white and color photographs. These macrophotographs and microphotographs made before, during and after nerve stimulation include serial angiograms of the renal circulation made with thorotrast,® gross appearances of kidney before and after the injection of vital dyes and india ink and microscopic section of kidneys showing localization of vital dyes and india ink in the renal vessels.

Franklin Farman, John A. Arcadi, Burton K. Brock and Kenneth A. Lemon, Robert S. Fox Urological Foundation, Whittier, Calif.:

Experimental Studies and Clinical Aspects of the Renal Circulation: Morphologic studies on the renal circulation under stress with production of the shunt mechanism are presented. The effect of water diuresis, pilocarpine, magnesium sulfate and severe dehydration on the renal blood flow are demonstrated by kidneys (rabbits) injected with india ink. The clinical implications of a double circulation (cortical and medullary) are shown.

Reed M. Nesbit, William J. Butler and Wayne L. Whitaker, University Hospital, Ann Arbor, Mich.:

Production of Epithelium-Lined Tubes from Buried Strips of Intact Skin: A novel but effective technic or urethroplasty for hypospadias has recently been reported by European surgeons. The exhibit deals with a study of the principles of growth that are concerned in the procedure. A strip of intact skin is buried subcutaneously, and in twelve days it takes form into a skin-lined tube by peripheral extension of the epithelial borders of the buried strip.

R. Theodore Bergman, Roger W. Barnes, C. LeRoy Turner, School of Medicine, College of Medical Evangelists, Los Angeles:

Significant Scrotal Swellings: Transparencies demonstrate various scrotal lesions causing enlargement of scrotum.

Hamilton W. McKay, H. Haynes Baird and Kenneth M. Lynch Jr., Charlotte, N. C.:

Management of the Injured Kidney: The exhibit includes (1) a chart enumerating postulates for teaching purposes regarding the management of the injured kidney; (2) illustrated case reports from the series of cases managed according to these postulates at the Charlotte Memorial Hospital; (3) illustrated chart depicting the undesirable sequellae of the improperly managed injured kidney.

Section on Orthopedic Surgery

The representative to the Scientific Exhibit from the Section on Orthopedic Surgery is Tom Outland, Elizabethtown. Pa.

Henry W. Meyerding, Mayo Clinic, Rochester, Minn.:

Tumors of the Bone, Benign and Malignant: The exhibit consists of (*a*) short case histories, (*b*) roentgenograms, (*c*) wax reproduction of surgical specimens to show the gross pathologic appearance, (*d*) models demonstrating the surgical technic employed in excision and bone grafting and (*e*) photomicrographs showing the histopathologic appearance of the various types of tumors, with the grade of malignancy. Diagrams show anatomic distribution of the lesions and show survival in various types of tumors. It presents a practical classification of bone tumors for the clinician, surgeon, roentgenologist and pathologist.

Norman L. Higinbotham, Bradley L. Coley and Robert E. Carroll, Memorial Hospital, New York:

Sarcoma Arising in Irradiated Bone: The exhibit is based on a study at Memorial Hospital which revealed 11 histologically proved cases of osteogenic sarcoma arising in irradiated bone six to twenty-two years after irradiation therapy. The sarcoma may develop in a benign tumor that has been exposed to heavy doses of roentgen rays or in normal bone after a latent period of five to twenty years following the last therapeutic exposure.

David Bosworth, A. Della Pietra and Richard Farrell, Sea View and St. Luke's Hospitals, New York:

Streptomycin in Bone and Joint Tuberculosis: Pathology of bone and joint tuberculosis is shown, with patients cared for before streptomycin contrasted with patients after treatment with streptomycin in open and closed lesions. Cases of failure are presented, with pathologic specimens to denote reasons for failure, and charts are shown to indicate dosage, results and conclusions, as well as toxic effects and present problems involved.

E. David Weinberg, Johns Hopkins Medical School and Hospital, Baltimore:

Late Spontaneous Rupture of the Extensor Pollicis Longus Tendon Following Colles Fracture: This is a rather rare and uncommon condition which results in considerable disability of the thumb unless it is recognized and treated properly. The symptoms, signs, anatomy, pathology, methods of treatment including that of the author and the end results are described. Statistical data of the reported cases in the literature regarding the incidence, age, sex and latent period are presented. The 3 cases of the author are demonstrated by preoperative and postoperative photographs, roentgenograms, drawings and colored photographs made at the time of operation and photomicrographs of the resected tendons.

Paul Strassburger, Halford Hallock and C. Zent Garber, New York Orthopedic Hospital, New York:

Fibrous Dysplasia of Bone: Photographs and roentgenograms show the various types of cases, single lesions, multiple lesions and the complete syndrome complex of bone lesions, skin pigmentation, sexual precocity and early skeletal maturation. Photomicrographs of the pathologic changes found in the bones are presented. An analysis of 9 cases treated at the New York Orthopedic Hospital, in 7 of which surgical procedures were carried out, is shown, with results of the procedures.

Laurence Jones, Cedars of Lebanon Hospital, Los Angeles:

The Postural Symptom Complex—A Different Cause and Treatment: One common type of foot and leg imbalance, namely, inversion or inward roll of the foot and leg, produces a roentgenographic measurable anterior tilt of the pelvis. This causes central nerve tension which is recognized by the following symptoms: when general it causes general fatigue; when localized it causes varied neuralgias occurring at any or multiple levels. A fixed method of postural correction reverses serial distortion bringing demonstrable and measurable correction of faulty foot posture and this in turn brings relief of symptoms. The mechanism of production is completely described as well as the general principles that govern this method of correction. Many illustrative case histories and radiographs are presented.

David Goldberg, Springfield, Mass.:

Metacarpal Fractures—A New Instrument for the Maintenance of Position after Reduction: A new instrument has been devised for the treatment of all types of metacarpal fractures including fractures and dislocations about the base of the thumb. In this type of fracture or dislocation, which is so easy to reduce, it is difficult to maintain the corrected position. This instrument employs the use of adjustable pressure pads, which easily maintains the corrected position by the closed method. It can easily be applied and adjusted without fear of pressure sores, infection, loss of position or deformities.

Section on Gastro-Enterology and Proctology

The representatives to the Scientific Exhibit from the Section on Gastro-Enterology and Proctology are Donovan C. Browne, New Orleans, and J. P. Nesselrod, Evanston, Ill.

Leo L. Hardt, Frederick Steigmann, Sheldon E. Krasnow and Robert Schlesinger, Hektoen Institute for Medical Research of Cook County Hospital, Stritch College of Medicine of Loyola University and University of Illinois College of Medicine, Chicago:

Studies on Gastric Acidity: Charts and diagrams demonstrate the effects on gastric acidity by various substances. The antacid effect of alkali amphoteric substances, organo substances, sedatives and antispasmodics is demonstrated and discussed. The effect of vasodilator substances and of parasympathomimetic and sympathomimetic drugs is discussed. An evaluation is presented of the present day methods for studying antacid effects in the light of the daily variations in gastric acidity in both the stimulated and unstimulated stomach. The value of the various modes of antacid administration are discussed and demonstrated by gastroscopic views.

Henry A. Rafsky, Michael Weingarten, Charles I. Krieger, Bernard Newman and Kurt Stern, Lenox Hill and Beth Israel Hospitals and Brooklyn Polytechnic Institute, New York and Brooklyn:

Electrophoretic Pattern in Liver Disease: The electrophoretic pattern was studied in a group of patients suffering from hepatitis, acute and chronic stage, cirrhosis of the liver, obstructive jaundice and cancer. Liver function tests and biopsies were performed in these patients. Tracings of the electrophoretic pattern are demonstrated and photomicrographs of the pathologic findings are shown. Case reports correlate the clinical and laboratory data.

William Z. Fradkin, The Jewish Hospital of Brooklyn, Brooklyn:

Diarrheal Diseases—Diagnosis and Treatment: The exhibit consists of charts, models, specimens and instruments illustrating the diagnosis and treatment of diarrheal diseases.

M. A. Spellberg, University of Illinois School of Medicine, S. P. Bralow, Hines Veterans Hospital, Hines, Ill., and Heinrich Necheles, Michael Reese Hospital, Chicago:

Evaluation of a New Antacid in Treatment of Peptic Ulcer: The usefulness of sodium carboxy-methyl cellulose, combined with a small amount of magnesium oxide, in the treatment of peptic ulcer is demonstrated. It is bland, nonabsorbable, not affecting acid base balance. It coats the mucosa of the stomach with a protective mucoid layer, and buffers the acidity for a prolonged period of time. It aids epithelization by producing a favorable p_H, and serves as a supporting base for epithelial cell movements. It has a highly protective effect against histamine-induced ulcers in dogs, combats constipation in patients and increases the bulk and water content of the stools of rats. One hundred and twenty-nine patients treated with this preparation and 100 patients treated with an aluminum hydroxide preparation were followed for one year and compared as to clinical results and relapse rate. Emphasis is placed on the relapse rate as a valuable criterion for the treatment of peptic ulcer.

M. C. F. Lindert, Milwaukee, James H. Topp, Rockford and Michael F. Koszalka, Wood, Wis.:

Liver Biopsy in the Study of Hepatic Disease: The exhibit is an appraisal of needle biopsy of the liver as utilized in the diagnosis of hepatic disease. One section is devoted to the presentation of the various modes of approach with schematic diagrams. The indications, danger and contraindications are listed. Hepatic diseases diagnosed by means of needle punch biopsy of the liver are divided into diffuse and focal disease. Studies on prognosis, progression and physiology of liver disorders are presented. The various punch biopsy needles utilized in performing liver biopsies are shown.

J. Peerman Nesselrod, Sherman Coleman and Barry J. Anson, Northwestern University Medical School, Chicago:

Anal Ducts and Glands—Their Relation to Anal Infection: A reconstruction of anal ducts and glands in the human adult is shown, together with photomicrographs and charts illustrating the role of these structures in the pathogenesis of common anorectal inflammatory disorders such as hemorrhoids, anal fissure, anal abscess and anal fistula.

Frank S. Windholz, Robert A. Scarborough and Russell R. Klein, Stanford University School of Medicine, San Francisco:

Polyps of the Colon—Diagnosis, Roentgenology and Pathology: Roentgenographs, colored photographs, photomicrographs and translucent drawings of the roentgen appearance and pathology of polyps of the colon are presented. Emphasis is laid on their visualization by fractional method of air-contrast barium enema (unpublished) which surpasses the accuracy of roentgen demonstration of polyps in the lower sigmoid by ordinary methods of barium air-contrast enema. Frequency, morphology (roentgen ray and pathology) of appearance and location in colon, types of microscopic structure problems and signs of malignant transformation, and results of surgical removal are illustrated.

Curtice Rosser, Tom E. Smith and Lewis Waters, American Proctologic Society, Dallas, Texas:

Fifty Years of Proctology: An exhibit depicting historical highlights of the American Proctologic Society since its founding in June 1899, at the American Medical Association session of that year. Instruments, books and photographs will be shown in evolutionary fashion. Data concerning the present services of proctology to mankind and the field of medicine are included.

Section on Radiology

The representative to the Scientific Exhibit from the Section on Radiology is S. W. Donaldson, Ann Arbor, Mich.

B. P. Widmann, H. W. Ostrum and R. F. Miller, Philadelphia General Hospital, Philadelphia:

Roentgen Appearance of Gastro-Intestinal Lesions: This demonstration is a correlation of the roentgen findings in diseases of the gastrointestinal tract, illustrated with kodachrome® photographs of gross surgical and autopsy specimens. The problems of differentiating benign and malignant conditions are illustrated. Many varied roentgen deformities of gastric and duodenal ulcers with and without niche defects and with questionable niche defects are portrayed. Specimens of mucosal redundancies, granulomas and other confusing pathologic conditions of the large and small intestine are illustrated.

Anna Goldfeder, Department of Hospitals, City of New York and New York University, New York:

Anomalous Radiosensitivities of Analogous Mammary Adenocarcinomas: The two analogous mammary adenocarcinomas used in the study arose in inbred strains of mice (C3H and dba) and were both diagnosed by the pathologist as adenocarcinomas; yet they appeared to differ widely in their biologic characteristics. This was evidenced by the difference in their rate of growth, metabolic activity and radiosensitivity. In contrast to the widely accepted belief that faster growing tumors are more radiosensitive than slower growing ones, it has been shown that this concept does not necessarily hold true. An explanation of this anomaly is offered and supported by experimental data.

Eugene P. Pendergrass, Edwin L. Lame and Herman W. Ostrum, Hospital of the University of Pennsylvania, Presbyterian Hospital and Philadelphia General Hospital, Philadelphia:

Hemosiderosis of the Lung Due to Mitral Valve Disease—Cases Simulating Pneumoconiosis: The exhibit shows chest roentgenograms of 4 autopsied and 2 living patients with pulmonary hemosiderosis due to rheumatic heart disease. These simulate silicosis, miliary tuberculosis, benign pneumoconiosis and a host of other nodular, discrete, pulmonary lesions. The microscopic study on 4 cases is the first to be reported in North America.

Wendell G. Scott, Sherwood Moore, Thomas Burford and Merl J. Carson, Washington Univerity School of Medicine, St. Louis:

Angiography with the Rapidograph Utilizing 9-Inch Roll Film in Diagnosis of Congenital Heart Disease: The exhibit illustrates the rapidograph, which was developed by adapting the magazine of a Fairchild aerial camera to roentgen ray roll film that is 9½ inches wide and 77 feet long, fitting it with an electric motor and reduction gears and inserting radiographic screens through which the film passes. The roentgen exposures are made approximately every one half second and are synchronized with a self-cocking Potter-Bucky grid to gain added clarity on the films. The entire equipment is fully automatized so that the closure of one switch puts the entire equipment in operation including the roentgen ray exposure. Also illustrated is the tautograph, a machine designed for the rapid exposure of conventional roentgen ray cassettes, and which has been used for the same purposes as the rapidograph. The tautograph runs at a slower rate with an exposure every second. The indications and technics for cardiovascular angiography and aortography are described and cardiovascular angiograms of various types of congenital heart disease are shown, as well as a few examples of cerebral angiography.

George S. Sharp, Eugene W. Demaree, Robert C. Wood and Herbert F. Williams, Pasadena, Calif.:

Treatment of Oral Cancer and Tumors of the Jaws: Transparencies illustrate lesions less than 1.0 cm. in diameter on all oral surfaces and the details of treatment. Prognoses for the various regions is given, with before and after results. Early recognition of cysts and tumors of the jaws is important, and their discovery likewise demands immediate biopsy and thorough knowledge of oral pathology in order that treatment may be started promptly, with minimum deformity. On account of difficulties in differential diagnosis, the following classification will be followed: Cysts of the jaws: (1) cysts of nonodontogenic origin (developmental), (*a*) median maxillary and mandibular cysts, (*b*) globulomaxillary cysts, (*c*) incisive canal cyst; (2) cysts of odontogenic origin, (*a*) radicular cysts, (*b*) follicular cyst; (3) dermoid cyst. Cystic tumors: (1) odontogenic tumors, (*a*) odontoma, (*b*) ameloblastoma; (2) osteogenic tumors, (*a*) true central giant cell tumor. The treatment is illustrated briefly with each type of cyst and tumor.

Vincent W. Archer, George Cooper Jr., Herbert D. Hebel and John G. Kroll, University of Virginia Hospital, Charlottesville, and Christian V. Cimmino, Fredericksburg, Va.:

Lead Fiberglas® Clothing Protective Against Roentgen and Certain Atomic Fission Rays: Samples of the material are shown with protection afforded from each type of ray. Charts show the amount and character of the radiation received in usual fluoroscopy and how a coverall of lead fiberglas® will more adequately protect the fluoroscopist. Proposed decontamination suits for workers in areas contaminated by atomic fission products are outlined.

C. A. Stevenson, R. D. Moreton and E. E. Seedorf, Scott and White Clinic, Temple, Texas:

The Roentgenologic Examination of the Colon—Special Reference to Obscure Carcinomas: The exhibit shows the exact technic of the examination, emphasizing the materials used and giving a statistical report and analysis of various types of preparations for the examination; moulages in plastics and wax simulate the fluoroscopic examination and show the various pathologic changes which can be demonstrated; roentgenograms illustrate what can be expected of the examination.

Raphael Pomeranz, Harry A. Brodkin, Harrison S. Martland Jr., Newark, N. J.:

Beryllium Granulomatosis: The exhibit consists of eighty 8 by 10 transparencies in 10 by 12 frames demonstrating radiologic, gross pathologic and microscopic studies of four autopsy cases of beryllium poisoning (1936-1948). Comparative histologic studies with other pneumoconiosis, silicosis, sarcoidosis Toxicologic studies. Radiologic follow-up of clinical materal (4 cases). Results of roentgen therapy. Differential diagnosis. Summary and conclusions.

C. R. Hughes, J. R. Hannan and B. E. Mulvey, Cleveland Clinic, Cleveland:

Spinal Cord Tumors: The exhibit presents a review of 71 spinal cord tumors found in 68 patients. Clinical, laboratory and roentgen ray findings are emphasized. Fourteen selected cases are presented to emphasize case histories, roentgen ray findings and histopathology.

Section on Anesthesiology

The representative to the Scientific Exhibit from the Section on Anesthesiology is Harold F. Bishop, Valhalla, N. Y.

William Neff and Edwin Byer, Veterans Hospital, San Francisco:

Dynamics of Respiration: Changes in the dynamics of respiration incident to respiratory obstruction and the open thorax are demonstrated, using a plastic model of the thoracic cage and the tracheo-bronchial tree. Clinical examples with photographs, roentgenograms and records are shown.

John Adriani and Henry N. Westhafer, Charity Hospital and Louisiana State University, New Orleans, La.:

Operating Room Accidents—Their Management and Prevention: Complications and accidents frequently encountered in the operating room by surgeons and anesthetists are summarized. Accidents resulting from improper evaluation and preparation of patients, lack of premedication, improper choice of anesthesia, technical errors and mismanagement of anesthesia and misuse of stimulants and resuscitative measures are emphasized. Each complication or breach of technic, together with the prevention or management thereof, is depicted by photographs or drawings.

C. R. Stephen and H. M. Slater, Children's Memorial Hospital, Montreal, Quebec:

Hypobaric Pontocaine® Spinal Analgesia for Children: The exhibit shows the technic of using hypobaric pontocaine® for spinal analgesis in children. Safety of administration is stressed. Typical results are shown, stressing low dosage required.

F. Paul Ansbro and S. Potter Bartley, Brooklyn:

Continuous Brachial Plexus Block: A transparency made over a skeleton shows the anatomic situation of the bracheal plexus and its surrounding structures. The placing of the needle near the subclavian artery and other important points are brought out on the model.

James E. Eckenhoff and Margo Van N. Deming, Children's Hospital of Philadelphia and Hospital of the University of Pennsylvania, Philadelphia:

Endotracheal Anesthesia in the Newborn and Young Infant: The exhibit displays equipment used for endotracheal anesthesia in the newborn and young infants according to the technic used at the Children's Hospital of Philadelphia. There is also a description of the relative anatomic positions of the epiglottis, glottis and trachea in infants of this age group. Roentgenograms, drawings and moulages are used to indicate these relationships and to demonstrate the endotracheal tubes in situ.

E. A. Rovenstine, E. M. Papper and Charles L. Burstein, New York University College of Medicine, New York:

Therapy with Procaine and Derivatives—Cardiac Arrhythmia: Charts and drawings demonstrate the therapeutic usefulness of procaine and one of its metabolites, diethylamino-ethanol. The experimental and clinical data presented have been collected by giving these drugs intravenously to man.

F. A. Duncan Alexander, Carroll E. Kern and Thomas McD. Anderson, Surgical Service, Veterans Administration Hospital, McKinney, Texas:

The Management of Pain: This exhibit demonstrates the various steps through which patients progress in the course of their treatment for the management of major pain problems. It includes diagnostic procedures, the functioning of the "Pain Clinic," surgical and nonsurgical procedures for the definitive treatment of pain. One section is devoted to a demonstration of the site of action of systemic drugs used in the control of pain. One section is devoted to the cardinal principles of the physiology of pain.

Donald E. Hale, Cleveland Clinic, Cleveland:

Arterial Infusion: The exhibit demonstrates the apparatus used in arterial infusion. A vessel, containing the fluid to be infused, is connected by means of rubber tubing and a glass cannula or hypodermic needle to the radial artery. Pressure is exerted on the fluid by means of a blood pressure bulb, and is measured on an aneroid manometer. A second manometer indicates the effect on the arterial tension of the subject. Accompanying charts and diagrams drawn from experimental and clinical material illustrate the steps and the technic of arterial cannulization, the course of the blood injected arterially and a comparison of the results of intravenous and intra-arterial infusions.

R. F. Courtin, R. G. Bickford and A. Faulconer Jr., Mayo Clinic, Rochester, Minn.:

Electro-Encephalography During Surgical Anesthesia—A New Aid for the Control of Anesthesia: A demonstration of an apparatus and technic for recording the electroencephalogram and electrocardiogram during surgery and its practical application in the control of inhalation anesthesia is presented. The records obtained during nitrous oxide-oxygen-ether anesthesia and their correlation with other physiologic changes are shown.

David J. Graubard, New York and Milton C. Peterson, Kansas City, Mo.:

Intravenous Procaine: The exhibit presents descriptions of the capillary bed (according to Zweifach): (*a*) the normal capillary, (*b*) the origin of a stimulus in the tissues and the beginning of the reflex impulses to produce pathologic changes, (*c*) the changes within the tissues when capillary permeability and anoxia develop and (*d*) the action of procaine in breaking the reflex arc and a reestablishment of the normal circulation. A brief history on the intravenous use of procaine is included. Clinical data, including roentgenograms, are shown on cases of reflex sympathetic dystrophy, subdeltoid bursitis, osteoarthritis of the spine and destructive arthritis of the hip associated with Paget's disease.

Section on General Practice of Medicine

The representative to the Scientific Exhibit from the Section on General Practice of Medicine is M. B. Casebolt, Kansas City, Mo.

Walter I. Buchert and George H. Jones, Geisinger Memorial Hospital, Danville, Pa.:

Hematuria: Short clinical histories, roentgenograms, photographs of gross specimens and photomicrographs taken from 32 selected cases presenting hematuria as the initial or chief complaint are presented. A diagram of the urinary tract listing the causes of hematuria is shown. A pamphlet is available containing an outline of the causes of hematuria.

Emanuel E. Mandel, Edward B. Lehmann and Delmo A. Paris, United States Public Health Service, Atlanta, Ga. and Chicago:

Simple Blood Tests Available to the General Practitioner: The exhibit illustrates the facility of obtaining biochemical information required in clinical practice and demonstrates the availability of simple methods in case-finding projects. The procedures include estimation of blood creatinine and glucose, the serum flocculation test with Hayem's solution (for serum protein alterations), the icterus index and the sedimentation rate. All these methods, of which the first three have recently been devised by the authors, can be carried out on a single venous blood sample, with a minimum of laboratory experience and equipment. The practical application of the methods in screening for, and management of, nephritis, diabetes, systemic infections, disorders of the liver and biliary tract, and neoplastic diseases, are outlined and the technic demonstrated.

William P. Boger, Martin E. Gallagher, J. William Crosson and Harrison F. Flippin, Philadelphia General Hospital, Philadelphia:

Penicillin Plasma Concentrations Following Various Penicillin Preparations: A number of penicillin preparations have been developed to prolong the period during which detectable penicillin plasma concentrations can be expected after a single injection of these preparations. Data are presented concerning the plasma concentrations of penicillin that result from injection of 300,000 units of (*a*) crystalline penicillin in aqueous solution, (*b*) procaine penicillin in oil, (*c*) procaine penicillin in aqueous suspension, (*d*) crystalline sodium and procaine penicillins in combination in an aqueous medium, (*e*) procaine penicillin in aluminum monostearate and oil and (*f*) sodium penicillin in aluminum monostearate and oil. The application of the various penicillin dosage forms to therapy are indicated. Penicillin plasma concentrations resulting from the injections of 1 to 8 cc. (300,000 to 2,400,000 units) of some of these preparations at single and multiple sites are shown to last for more than ten days. Photomicrographs of the sites of injection of penicillin in (*a*) beeswax and oil and (*b*) aluminum monostearate and oil are indicated.

C. D. Van Houweling, C. R. Donham, J. S. Bengston and G. W. Jensen, American Veterinary Medical Association, Chicago:

Brucellosis in Animals—Transmission, Diagnosis and Eradication: Animal species susceptible to infection by the Brucella organisms are shown with reference to human infection. Indications of the transmission between animal species and man with graphic indications of the incidence of brucellosis in animals, diagnostic methods and recommended control procedures are presented.

Louis J. Regan, Los Angeles:

Medical Malpractice: The exhibit of charts, posters and drawings present three aspects of the subject: (1) consent to operation, (2) asking for a suit and (3) malpractice, general principles.

Willis E. Brown, Robert E. Hodges and James T. Bradbury, State University of Iowa Hospitals, Iowa City:

The Antidiuretic Effects of Narcotics: The response of human kidneys to various agents has been studied by means of clearances of para-amino-hippurate and sodium thiosulfate. Normal women (some of whom were pregnant) have been studied, and observations made of renal blood flow, glomerular filtration rate, filtration fraction, reabsorption fraction, and urine volume. Adrenalin and pitressin both produce antidiuresis, but apparently by different mechanisms. These studies indicate that both hormones decrease the effective blood flow and glomerular filtration to a similar degree. Pitressin, however, increases the filtration fraction (per cent of plasma filtered) and the reabsorption fraction (per cent of glomerular filtration reabsorbed by the tubules) to a greater extent than epinephrine. Morphine and the other narcotic drugs produce an antidiuresis by virtue of a process similar to that observed with epinephrine. Toxemias of pregnancy associated with oliguria show an alteration in kidney physiology similar to that produced in normal patients by pitressin. Morphine in these toxemic patients accentuated the deviation from normal. The clinical significance of these observations will be presented.

Chevalier L. Jackson, John F. Huber, Charles M. Norris, and Harry Morse, Temple University Hospital, Philadelphia:

The Segmental Bronchus and the Bronchopulmonary Segment: The exhibit demonstrates the applied anatomy of the bronchopulmonary segments and their corresponding segmental bronchi. It includes clinical demonstrations of the favorite localization of various lesions, such as pulmonary abscess, tuberculosis and foreign body, as well as showing the significance to the thoracic surgeon, radiologist and the bronchologist, of the segmental concept. Both prepared and fresh specimens of the bronchial tree are presented as well as models, actual size, enlarged and in miniature. The uses of such models in study and teaching are demonstrated.

Herman E. Hilleboe, Ray E. Trussell, E. R. Schlesinger, R. F. Korns, Granville W. Larimore and Madeleine

Y. PHANEUF, New York State Health Department and Albany Medical College, Albany, N. Y.:

Protecting the Newborn: A statewide program for reducing the hazards of infection during the newborn period is presented. Particular reference is made to the prevention of infection in hospital nurseries and to the role played by physicians, nurses and hospital administrators in protecting the newborn.

CLEVELAND J. WHITE and ROBERT H. HARRIS, Stritch School of Medicine of Loyola University, Chicago:

Diseases of Nails: Nail diseases due to general medical syndromes as well as many due to dermatologic dyscrasias are shown by photographs, moulages, charts and posters.

Section on Chest Diseases

The representative to the Scientific Exhibit from the Section on Chest Diseases is Edwin R. Levine, Chicago.

A. SCHOMER, H. E. BASS and R. BERKE, Veterans Administration, New York:

Coccidioidomycosis in Veterans of World War II—Pulmonary Residuals: Charts show (1) the endemic area; (2) cultural cycle of Coccidioides immitis, depicting saprophytic and parasitic phases; (3) photographs of the fungus in wet smear, tissue section, etc.; (4) diagnostic criteria with discussions of coccidioidin skin tests, serology, fungus cultures, etc.; (5) differential diagnosis of this disease and pulmonary tuberculosis, neoplastic diseases of the lung, lymphomas, other fungous diseases, lung abscess, lung cysts and sarcoidosis and (5) a series of cases demonstrating pulmonary lesions of coccidioidomycosis. These lesions in many instances have a striking resemblance to tuberculosis, and several were initially mistaken for tuberculosis.

SEYMOUR M. FARBER, MORTIMER A. BENIOFF, ALLEN K. MCGRATH JR. and MILTON ROSENTHAL, San Francisco Hospital, San Francisco:

Carcinoma of the Lung—Diagnosis by Cytologic Examination of Sputum and Bronchial Secretions: The exhibit consists of posters on (1) methods of cytologic examination, (2) diagnostic criteria in cells from sputum and (3) statistical tables on results by this technic of diagnosis.

ALLAN HURST, SIDNEY H. DRESSLER, JOHN B. GROW, HAROLD PERLMUTTER and ALBERT GUGGENHEIM, National Jewish Hospital, Denver, Colo.:

Surgical Therapy of Pulmonary Tuberculosis: Various surgical operations used in the treatment of pulmonary tuberculosis are presented. Nine specimens are shown of thoracoplasty, extrapleural pneumonolysis, phrenic, pneumothorax with adhesions, lobectomy and pneumonectomy, with roentgenograms, histories and gross and microscopic demonstrations.

KARL P. KLASSEN, GEORGE M. CURTIS and ALEXANDER J. ANLYAN, Department of Research Surgery, Ohio State University Medical School, Columbus, Ohio:

Biopsy of Diffuse Pulmonary Lesions: The exhibit illustrates the method of pulmonary biopsy. Ten illustrative cases of diffuse pulmonary lesions diagnosed by biopsy are shown, with illustrations of the surgical technic used.

ROBERT J. ANDERSON, IRA LEWIS, CARROLL PALMER and H. F. A. LONG, United States Public Health Service, Washington, D. C.:

Pulmonary Infiltrates in Student Nurses Associated with Conversion and Tuberculin Sensitivity: The exhibit presents cases in which student nurses convert from negative to positive in the tuberculin skin test while in the course of their training period; associated with the change in skin sensitivity, pulmonary lesions appear. Subsequent course of these lesions over a limited period is shown.

CHARLES P. BAILEY, ROBERT P. GLOVER and THOMAS J. O'NEILL, Hahnemann Medical College and Hospital and Episcopal Hospital, Philadelphia:

Surgery of Mitral Stenosis—Mitral Commissurotomy: Charts, drawings, photographs, roentgenograms, phonocardiograms and patients show the development of surgery of mitral stenosis, its present day concepts, its technics and its increasingly prominent position in the therapy of mitral stenosis.

HERBERT C. MAIER, FRANK BORTONE, SAMUEL COHEN and BENJAMIN P. POTTER, Medical Center—Pollak Hospital for Chest Diseases, Jersey City, N. J.:

Resection in the Treatment of Chronic Pulmonary Diseases: The exhibit emphasizes the therapeutic role that pulmonary resection is now playing in the treatment of tuberculosis, pulmonary abscess, bronchiectasis and bronchogenic carcinoma. Advances in anesthesia, surgical technic and chemotherapy have been largely responsible for this progress in thoracic surgery. The indications for resection together with operative data (complications and results) are presented.

AARON CHAVES and VERA LEITES, Bureau of Tuberculosis, New York Department of Health, New York:

Pulmonary Tuberculosis—Its Development in Persons Over 40 years of Age: Pulmonary tuberculosis, formerly considered a disease of the young, has become of increasing importance in elderly persons. In New York City of 17,454 deaths from tuberculosis in the five year period 1942-1946, 10,496, or 60 per cent, occurred in persons above 40 years of age. The exhibit consists of two groups of cases. The first group presents films of patients over 40 years of age, showing the development of pulmonary tuberculosis within a variable period after a normal chest roentgenogram had been obtained. The other group illustrates the frequently progressive course of minimal pulmonary tuberculosis in elderly persons. Increased attention of the family physician to the frequency and possible seriousness of pulmonary tuberculosis in elderly persons will lead to earlier diagnosis and treatment.

J. R. MCDONALD, L. B. WOOLNER and A. H. BULBULIAN, Mayo Clinic, Rochester, Minn.:

Tumors of the Lung—A Pathologic Study of Surgical Lesions: The exhibit is based on experience with tumors of the lung as seen in the surgical pathology laboratory. It includes data on bronchogenic carcinoma, bronchial adenoma, pulmonary adenomatosis and alveolar cell tumor, hamartoma of the lung and miscellaneous and metastatic pulmonary tumors. The gross and microscopic appearances of these tumors as seen in a large series of cases are demonstrated. The histogenesis, site of origin and rate of growth and metastasizing capacity of each group of tumors are demonstrated.

ARMY AND NAVY EXHIBITS

Exhibits from the United States Army and the United States Navy depict some of the recent advances in medicine.

Army Medicine Today

The Surgeon General, United States Army, presents six exhibits, as follows:

LIEUT. COL. JOE M. BLUMBERG, M.C., Laboratory Service, Oliver General Hospital, and EDGAR R. PUND, University of Georgia School of Medicine, Augusta, Ga.:

Exfoliative Cytology and Carcinogenesis of Preinvasive Carcinoma of Cervix: The exhibit presents various factors concerned with this condition.

LIEUT. COL. FRANK A. TODD, Veterinary Division, Office of the Surgeon General, Washington, D. C.:

Rabies: This exhibit depicts the latest methods of diagnosing, controlling and preventing the spread of rabies.

JOSEPH SMADEL, Army Medical Department Research and Graduate School, Washington, D. C.:

Choloromycetin: The exhibit presents current 1949 information on all work done on chloromycetin, covering the treatment of brucellosis, field treatment of the rickettsial diseases and typhoid, as well as the prophylaxis of cholera in mice and field trials in scrub typhus.

MAJOR BURKE M. SNOW, M.C., Army Medical Center, Washington, D. C.:

The Army Brace Research Program: The exhibit includes demonstrations of the new aluminum alloy braces developed by the Army, the principles of their construction and the physical properties of aluminum and its alloys.

GUSTAVUS H. KLINCK JR., Army Institute of Pathology, Washington, D. C., and the Committee on Thyroid Cancer, American Goiter Association:

Manifestations of Secondary Papillary Adenocarcinoma of the Thyroid: The anatomic and histologic relationships between primary and secondary papillary adenocarcinoma of the thyroid are shown by means of plastic symbols, anatomic drawings and color photomicrographs. The frequent occurrence of nontumorous-appearing histologic structures in secondary lesions is emphasized.

COL. HUGH W. MAHON, M.C., Laboratory Service, Fitzsimmons General Hospital, Denver, Colo.:

Mediastinal Cysts and Tumors: Twenty-four cases are presented illustrating dermoid cyst, solid teratomas, pericardial celomic cyst, bronchial cysts, esophageal myoma, lipoma, xanthoma, ganglioneuroma, neurofibroma, thymic cyst, Hodgkin's and lymphosarcoma.

Navy Medicine Today

The Bureau of Medicine and Surgery, United States Navy, presents the following exhibits dealing with medicine in the Navy:

COMDR. R. V. SCHULTZ (MC) U.S.N., COMDR. L. L. BEAN (MC) U.S.N. and COMDR. R. R. MYERS, (MC) U.S.N., Bureau of Medicine and Surgery, Navy Department, Washington, D. C:

Cerebral Angiography: The exhibit shows the total cases studied, causes of death, present and secondary symptoms, temperature, pulse, respiration and white blood cell count, migration and duration of pain, anesthesia incision, surgical management of acute, chronic and ruptured cases, method of handling stump and complications.

COMDR. T. A. HARRIS (MC) U.S.N. and LIEUT. J. W. BAGBY JR., (MSC) U.S.N., Bureau of Medicine and Surgery, United States Navy, Washington, D. C.:

The Practice of Psychiatry in the Navy: The exhibit shows a graphic portrayal of the professional career aspects of the practice of psychiatry in the Navy—the scope, clinical and administrative organization and mission of naval psychiatry. Specifically, the exhibit describes the opportunities offered in a career of psychiatry in the Navy in the fields of personnel selection for forensic psychiatry, mental hygiene, preventive psychiatry, intensive treatment, teaching and research. The illustrative material is drawn from the Medical Department of the Navy, psychiatry centers at Philadelphia and Mare Island and also Naval training centers, Marine Corps depots, retraining commands, disciplinary barracks and Naval hospitals. The exhibit in essence says that psychiatry can be and is a career in the Medical Department of the United States Navy.

LAURANCE W. KINSELL, SHELDON MARGEN, DAVID P. McCALLIE, LIEUT. (j.g.) M.C., U.S.N.R., and GEORGE D. MICHAELS, U. S. Naval Hospital-University of California Medical School, Oakland and San Francisco, HAROLD A. HARPER, University of San Francisco, San Francisco, HAROLD TARVER, University of California, Berkeley, and ALDEN V. HOLMES, LIEUT. (j.g.) M.C., U.S.N., U. S. Naval Hospital, Oakland:

The Role of Sulfur in the Human Economy: The sulfur-containing amino acids, methionine and cystine, are constituents of protein tissues in the human being. Because of their unique possession of sulfur as well as nitrogen, it is possible to make a more selective evaluation of their role in protein metabolism than is the case with many other amino acids. The recent availability of isotopic sulfur (S^{35}) has made available to the investigator tools of even greater precision for the evaluation of normal and abnormal protein metabolism. Data presented bring out the known roles of the sulfur-containing amino acids in human metabolism and also set forth the role of other sulfur-containing compounds of biologic importance. In addition, data are presented dealing with investigations carried out in the authors' laboratory which portray (*a*) the relationship of methionine to human liver damage in terms of rate of utilization of intravenously and orally administered DL-methionine; (*b*) the role of methionine in the therapy of liver disease (the possible toxicity of methionine for patients with liver damage is discussed) and (*c*) the use of S^{35}—labeled methionine in the evaluation of protein metabolism in normal persons, in patients with liver damage, with "idiopathic hypoproteinemia" or with certain endocrinopathies. (There is evidence that this material serves as a valuable diagnostic agent in certain obscure metabolic disturbances.)

MISCELLANEOUS EXHIBITS

MILDRED ELSON, American Physical Therapy Association, New York:

Physical Therapy—A Service for Physicians: Physical therapy is a medical service and an integral part of a total physical rehabilitation program. The exhibit presents illustrative examples of physical therapy procedures for different clinical entities that may be carried out in the physical therapy department and in the home.

DONALD G. ANDERSON, F. H. ARESTAD and E. H. LEVEROOS, Council on Medical Education and Hospitals, American Medical Association, Chicago:

Medical Education: The exhibit displays data on registration and approval of hospitals, training of interns and resident physicians, technical hospital personnel, medical education and medical licensure. Data pertaining to lists of approved medical schools, hospitals approved for internships and residencies and approved technical schools are presented.

GEORGE W. COOLEY and HOWARD O. BROWER, Council on Medical Service, American Medical Association, FRANK SMITH, Associated Medical Care Plans, and BILLEDWARD HOWLAND, Health Insurance Council, Chicago:

Voluntary Health Insurance: The exhibit features the widespread growth of all types of voluntary health insurance plans, together with the coverage in each state and the location of the medical society plans. An analysis of the population of the United States shows the part of the population not readily eligible to voluntary health insurance and the percentage of the eligible portion covered today and ten years ago. The different types of voluntary plans available to the public are presented.

AUGUSTUS THORNDIKE, Veterans Administration, Washington, D. C.:

Prosthetic and Sensory Aids Service: The exhibit displays representative types of all significant prosthetic and sensory aids now available.

CHARLES S. CAMERON, American Cancer Society, New York:

American Cancer Society—Organization and Program: Under a diagram showing the organization of the American Cancer Society, the various aspects of its program, including education, service, research and field army activities are portrayed by means of three dimensional figures and illuminated drawings. Side panels show cancer centers by state in relation to population and the distribution of funds.

Hart E. Van Riper, National Foundation for Infantile Paralysis, New York:

The Service Programs of the National Foundation for Infantile Paralysis: A detailed description is presented of the services of the National Foundation, which include scholarships and fellowships to physicians, scientists and medical ancillary groups, services to hospitals, furnishing of essential equipment and information service to physicians and nurses and physical therapists.

MOTION PICTURES

Two motion picture theaters, located in rooms adjacent to the exhibits, will be in continuous operation. Each film will be shown once daily, Monday morning to Friday noon, on a definite schedule.

Leon Gerber and Harry Abrahams, George Washington University Medical School, Washington, D. C.:

Lumbar Sympathectomy—Clinical Application and Physiologic Principles: This motion picture shows preoperative and postoperative patients, operation by two technics, anatomic study, animation strip of physiologic principles. Sound, thirty-two minutes.

Robert D. Woolsey, St. Louis University, St. Louis:

Trigeminal Neuralgia: This film shows preoperative and postoperative pictures of patients with trigeminal neuralgia. The operation of differential section of the fifth nerve, saving the ophthalmic division and motor root, is presented. Silent, thirty-four minutes.

Philip Thorek, Chicago:

Supra-Aortic Esophagogastrostomy for Carcinoma of the Midportion of the Esophagus: This picture presents a resection for carcinoma of the midportion of the esophagus. The patient, a 43 year old man, complained of marked dysphagia and starvation. Roentgenograms and esophagoscopic studies revealed an almost complete obstruction, caused by a carcinoma. The procedure shows the mobilization of the esophagus from the thoracic inlet above to its entrance into the stomach below. It is detached at its gastric end and brought over the arch of the aorta. After removal of the tumor and partial esophagectomy, a transthoracic supra-aortic end to side esophagogastrostomy is performed. Postoperative follow-up pictures of the patient, diagrammatic illustrations of the operative procedure and preoperative and postoperative roentgen studies amplify the film. Silent, thirty-eight minutes.

R. Arnold Griswold, University of Louisville School of Medicine, Louisville, Ky.:

Pericardiectomy for Chronic Cardiac Compression Due to Constricting Pericarditis: This film is a composite of several cases of constrictive pericarditis illustrating the etiology, pathologic physiology, symptomatology, surgical treatment and results of surgical treatment. Silent, thirty-two minutes.

Willis J. Potts, Childrens' Memorial Hospital, Chicago:

Surgical Division of Patent Ductus Arteriosus: Division and suture of a patent ductus arteriosus is believed preferable to ligation. The danger of hemorrhage from a slipping clamp has been a deterrent to general acceptance of division as the operation of choice. The technic of division and suture of the ductus by means of a new clamp is shown. Tiny, nontraumatic teeth on the jaws of the clamp embed themselves in the adventitia, prevent slipping and lessen greatly the danger of uncontrollable hemorrhage. Silent, twenty-five minutes.

Vernon L. Hart and Wesley H. Burnham, Minneapolis:

Congenital Dislocation of the Hip—Recognition and Treatment during Early Infancy Before Weight Bearing: The film demonstrates the clinical findings, the roentgen ray features and the treatment of congenital dislocation of the hip joint during early infancy before weight bearing. It emphasizes the fact that our concept of the pathogenesis of this congenital malformation is rapidly changing. The primary acetabular dysplasia or flat socket results in instability and incongruity of the hip joint. The femoral head may or may not displace. The displacement of the femoral head from the acetabulum may be partial (subluxation) or complete (dislocation). During early infancy congenital subluxation is common while congenital dislocation is rare. Congenital subluxation during infancy can be recognized. Treatment at this early age with the Frejka splint prevents congenital dislocation of the hip joint. During early infancy the hip joint is usually subluxated and not dislocated; it is on its way to dislocation. Dislocation can be prevented. Silent, thirty-three minutes.

Lyon K. Loomis, Louisiana State University School of Medicine, New Orleans:

Stenosing Tenosynovitis at Radial Styloid Process (de Quervain's Disease): The film shows anatomy, pathology, clinical findings and surgical treatment of a disease which is frequently confused with arthritis, periostitis, neuritis, sprain and other conditions. Silent, twenty minutes.

H. E. Nieburgs, Edgar R. Pund and Hoke Wammock, University of Georgia, School of Medicine, Augusta, Ga.:

Diagnosis of Cancer by Exfoliative Cytology: The motion picture demonstrates the following: (1) method of taking vaginal and endocervical smears; (2) normal cytologic changes during the menstrual cycle, pregnancy and the menopause; (3) the diagnosis of preinvasive and invasive cancer of the cervix uteri, illustrating the morphology between these two types of cervical cancer; (4) diagnosis of endometrial cancer; (5) sources of error in the cytologic interpretation and, (6) the diagnosis of cancer from other body fluids such as sputum, bronchial aspiration, gastric lavage and prostate. Silent, twenty minutes.

American Cancer Society, New York, and National Cancer Institute, United States Public Health Service, Bethesda, Md.:

Cancer—The Problem of Early Diagnosis: The film is designed to show that the family physician offers the only immediate hope of reducing the annual toll of more than 180,000 deaths from cancer. The picture begins with Dr. Theodor Billroth's famous operation for gastric cancer in 1881. It portrays graphically the difference made today by early diagnosis of cancer of the stomach, breast, rectum, cervix and lung. The camera shows family doctors making examinations and surgeons performing operations. Animation is used to portray what is happening inside the body of the cancer patient. A series of charts dramatizes the reduced mortality rate when diagnosis and treatment are early instead of late. Sound, thirty minutes.

The State of California, Department of Public Health and the California Medical Association Cancer Commission:

Examination of the Breast for Early Cancer: The motion picture illustrates briefly the various methods for examination of the female breast to determine the presence of early cancer. The authors stress the essentials of a proper examination, namely, gaining the patient's confidence, good lighting, careful inspection, palpation and transillumination. Sound, twenty minutes.

Arthur C. Corcoran, Don Carlos Hines and Irvine H. Page, Lilly Laboratory for Clinical Research, Indianapolis:

Kidney Function in Disease: This motion picture is a sequel to the film "Kidney Function in Health." Building on this foundation, it begins with a discussion of the renal pressor system and then proceeds to show the changes in structure and function of the kidneys in hypertension, glomerulonephritis, pyelonephritis, renal calculus, crush syndrome and certain other conditions. The metabolism of water, electrolytes, acids and bases is discussed so far as it pertains to renal function. The film concludes with a concrete discussion of the treatment of diseases involving the kidneys, in the light of their underlying pathologic anatomy and physiology. Sound, forty-six minutes.

Earl C. Elkins, Mayo Clinic, Rochester, Minn.:

Physical Rehabilitation of Paraplegics: The film shows the procedures used in the physical rehabilitation of the paraplegic patient. Activities of the patients are presented from the earliest activities used following the period in which they have been bedridden, to the time when they become fully independent physically. These include muscle strengthening exercises, exercises necessary to develop the patients for use of crutches, training in getting in and out of chairs or wheel chairs and to and from crutches, crutch gaits, climbing stairs and other activities to develop physical independence in the patient. Fourteen different patients are presented in the various stages of physical rehabilitation. Silent, thirty-four minutes.

Byron E. Hall, Henry W. Woltman and Frank H. Krusen, Mayo Clinic, Rochester, Minn.:

Vitamin B_{12} and Coordinating Exercises for Combined Degeneration of the Spinal Cord: Good results have been obtained in treating combined degeneration of the spinal cord in pernicious anemia by employing adequate administration of vitamin B_{12} to go with proper instruction in coordinating exercises. This film illustrates the coordinating exercises and shows a series of patients before, during and after such treatment. Silent, forty minutes.

Carroll L. Birch, Louis R. Limarzi, Robert Keeton and Otto Kampmeier, University of Illinois College of Medicine, Chicago:

Animated Hematology—Bone Marrow: The film depicts embryology of bone marrow from kodachrome® microphotographs of human material. It shows technic of bone marrow aspiration, normal marrow distribution and cytology. Pathologic changes are described in bone marrow in pernicious and other anemias; leukemias; thrombopenic purpura; bacterial infection; protozoal infection (malaria, etc.); fungous infections (histoplasmosis); infiltrations (malignant tumor cells, etc.); Gauchers's disease; multiple myeloma and some systemic conditions. The summary evaluates bone marrow findings regarding diagnosis, prognosis and treatment. Silent, forty-five minutes.

Conrad Berens, Arthur B. Duel Jr. and William Ryan, Ophthalmological Foundation, Inc., New York:

Cycloelectrolysis for Glaucoma: Indications for the procedure is given, as well as surgical technic and postoperative care. Silent, eighteen minutes.

Harry E. Bacon, Temple University School of Medicine, Philadelphia:

The Technic of Abdominoperineal Proctosigmoidectomy without Colostomy and with Preservation of the Sphincter Musculature: The film shows the technic of abdominoperineal proctosigmoidectomy without colostomy and with preservation of the sphincter musculature, based on 401 cases. Silent, thirty minutes.

Harry E. Bacon, Temple University School of Medicine, Philadelphia:

Transcolonic Removal of Benign Adenomatous Polyps: The film shows the technic of transcolonic removal of benign adenomatous polyps based on 56 cases. Silent, twenty minutes.

American Medical Association, in cooperation with the Committee on Technical Advisers of the United States Army, United States Public Health Service and the American Red Cross:

They Also Serve: This film stresses the physician's responsibility in the event of a major disaster. It emphasizes the importance of organizing and supporting local emergency committees and points out the importance of thorough planning so that physicians may be ready for any emergency. Several activities which may come into play during a major disaster are illustrated. Sound, twenty minutes.

Chevalier L. Jackson, John F. Huber and Charles M. Norris, Temple University School of Medicine, Philadelphia:

Applied Anatomy of the Bronchi and Lungs: This film shows, by means of animated drawings in color, the lobar and segmental subdivision of the lungs according to bronchial distribution. By means of color key it shows the relationship between the bronchopulmonary segment and its corresponding segmental bronchus. In the second part of the film, with the bronchial tree and lungs in the inverted position, the color key method is used to show the relation of the bronchial orifice, as seen by the bronchoscopist, to the segmental bronchus and bronchopulmonary segment. It is the purpose of this film to show the relative size and importance of the different segments, as well as their relative position in the lung. This demonstration is of interest and importance to the thoracic surgeon, the roentgenologist and the bronchologist. Silent, fourteen minutes.

W. D. Seybold, Mayo Clinic, Rochester, Minn.:

Congenital Atresia of the Esophagus with Tracheoesophageal Fistula—Surgical Repair: The common varieties are shown by diagram. Essential points in diagnosis are made, and the surgical repair showing closure of the tracheoesophageal fistula and primary end to end esophageal anastomosis through a right posterior extrapleural approach is shown. The most important function of postoperative care, including the performance of a Witzel gastrostomy for temporary feeding purposes, is shown. Silent, eighteen minutes.

Stuart W. Harrington, Mayo Clinic, Rochester, Minn.:

Pulsion Diverticulum of Lower Esophagus—Transpleural One Stage Diverticulectomy: The motion picture shows previous history, essential laboratory and roentgenologic findings of patient on admission, operative procedure of transpleural one stage diverticulectomy and postoperative roentgenologic findings and result. Silent, fifteen minutes.

Julius Lempert, Lempert Institute of Otology, New York:

Bone-Dust-Free Lempert Fenestra Nov-Ovalis: The film depicts a new technic of creating a fenestra in the vestibule of the labyrinth for the restoration of practical hearing in clinical otosclerosis without creating bone dust or bone chips. The problem of removing bone particles from the fenestra rim and perilymphatic space which would stimulate osteogenetic closure of the fenestra is thus disposed of. Silent, fifteen minutes.

Myron Prinzmetal, Eliot Corday, Alvin L. Sellers, Walter Flieg and H. E. Kruger, Institute for Medical Research, Cedars of Lebanon Hospital, Los Angeles:

The Nature and Treatment of the Auricular Arrhythmias: Color cinematographs at 2,000 frames per second (130 times faster than normal) of the auricles of the intact dog's heart have been taken. Detail of auricular contraction can be visualized for the first time. Simultaneous electrocardiograms were taken employing direct auricular leads and indirect limb leads. The mechanisms of auricular flutter and auricular fibrillation can be clearly seen. It is proved that the circus movement theory of these arrhythmias is no longer tenable. Auricular extrasystole, paroxysmal auricular tachycardia, auricular flutter and auricular fibrillation are of a unitary nature and are due to impulses emitting from a single ectopic focus. The particular arrhythmia observed depends on the rate of discharge of impulses from this focus. The effect of quinidine on the contraction waves in the various auricular arrhythmias is clearly demonstrated. The dramatic therapeutic action of digitalis on the dilated failing heart is well visualized and adds to knowledge of the action of this drug. The various clinical applications of these studies are illustrated. Silent, thirty minutes.

The TECHNICAL Exposition

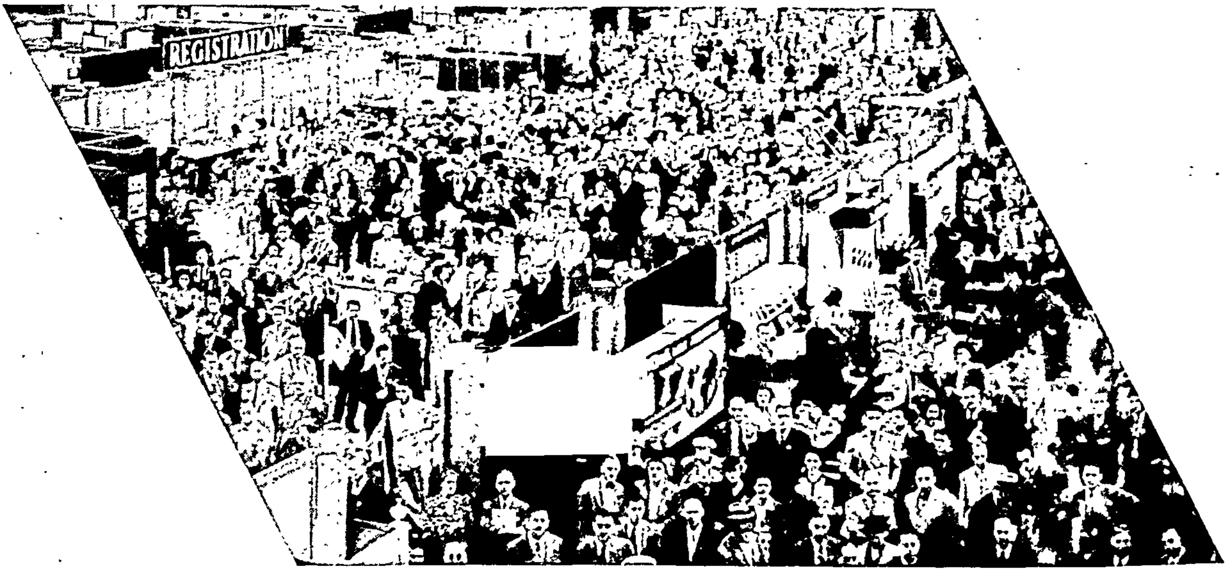
Atlantic City has been the "stage" for many a successful A. M. A. Session. On June 6 we shall be there again with what will probably be the largest and most representative group of medical exhibits ever assembled.

Whether you are a general practitioner, specialist, resident or intern, you will find much of immediate interest: latest advances of medical research—radioactive isotopes, the newer antibiotics . . . aureomycin, dihydrostreptomycin, chloramphenicol . . . the new rapid test for serodiagnosis of syphilis with cardiolipin, cytological diagnosis of cancer, etc.; surprising innovations in apparatus and instruments; the last word in books by leading medical publishers; new methods of teaching by colored television and films—all will be there for you to make a quick practical check on what American manufacturers have contributed to scientific medicine to help keep your professional activities "abreast-of-the-times."

Many physicians have remarked that a few days spent at an A. M. A. Session is equivalent to a long period of post-graduate study and does much to put the innovations presented into practical application in day-to-day patient contact.

The Technical Exhibition will open at 8:30 each morning, beginning June 6, and remain open until 6:00 each evening, except on Friday, June 10, when the Exhibition ends at noon. Every moment you can spend at the Convention Hall will be well worth your while. So come early, stay late, and make the most of this wonderful show that has been assembled for your benefit and pleasure.

Thos. R. Gardiner,
Business Manager and Director of Technical Exhibits



BRIEF DESCRIPTIONS GIVING A PREVIEW OF MOST OF THE TECHNICAL EXHIBITS:

ABBOTT LABORATORIES, North Chicago, Ill. (Booths L-18, L-20, M-17 and M-19): An exhibit based on research with radioactive isotopes and their application to experimental and clinical medicine will be sponsored by Abbott Laboratories. Abbott is currently producing and distributing radioactive pharmaceuticals to numerous research and medical insituations. Also exhibited will be a number of leading Abbott specialties.

ACOUSTICON INTERNATIONAL, New York, N. Y. (Booth J-30), will feature the tiny, palm-size radio attachment that transforms a hearing aid into a "personal" radio! Employing specially developed midget vacuum tubes and radar-type tuning—this Super-Radion attachment enables a hard of hearing person to enjoy radio with "custom quality" for his own particular kind of hearing loss. Performance of Super-Radion is equal to a standard five tube radio and there is sufficient power to bring reception anywhere—at home, traveling, etc.—despite the extremely small size of the attachment.

ALLERGY-FREE PRODUCTS, Brooklyn, N. Y. (Booth I-32) specializing in products for the allergic patient, will feature Goodyear's Airfoam pillows; mattresses; beds; furniture covered with Protecto-Dust Encasings for double protection; a 100% all wool blanket without any fuzz or dye; and a window air purifier.

W. D. ALLISON CO., Indianapolis, Ind. (Booth G-9): Of practical interest to all physicians will be the new exhibit of Steel-Furniture offered for the first time by Allison. Included will be: Hanes Rectal Table, with the Hand Tilt Mechanism; Windsor Examining Room Suite, with the Sponge Rubber top covered with Duran; Consultation Room Group to match the Windsor Suite; and Allison Pediatric Table with new features, new design.

ALMAY, INC., New York, N. Y. (Booth M-24), will exhibit its complete line of hypo-allergenic cosmetics. These cosmetically elegant products are available either perfumed or unscented. Lipsticks are made without indelible dye and on special formula. Available to physicians will be, Raw Material Testing Sets for determining specific sensitizers and descriptive literature.

A. S. ALOE CO., St. Louis, Mo. (Booths C-21, C-23), will feature the latest in surgical instruments and equipment for your office as well as a complete and modern line of Physio-Therapy and X-ray equipment. Your visit will be welcomed.

AMERICAN CAN COMPANY, New York, N. Y. (Booth H-17), will present information concerning those aspects of commercially canned foods which are of particular interest to the medical profession. Physicians may register at this booth for a free copy of the revised edition of The Canned Food Reference Manual, a publication prepared and edited by American Can Company's Research staff.

AMERICAN CYSTOSCOPE MAKERS, INC., New York, N. Y. (Booths E-22, E-24), will show a new telescopic esophagoscope, bronchoscope, operating gastroscope, and photographic endoscopic instruments. Their complete catheter, diagnostic, operating and electro medical equipment will also be displayed.

AMERICAN HOSPITAL SUPPLY CORP., Evanston, Ill. (Booth K-10), will exhibit Baxter Intravenous Solutions and Blood Transfusion Equipment with all necessary accessories; Human Blood Grouping and Typing Serums; Tomac Oral Protein Supplement, a remarkably palatable, non-hydrolyzed, highly efficient powdered Protein with 70% protein and low carbohydrate content—and fully accepted by the Council on Foods and Nutrition of the A.M.A.; the Vasoscillator, Sanders Oscillating bed for the treatment of peripheral vascular ailments; and a selected group of Tomac Products.

AMERICAN OPTICAL CO., Southbridge, Mass. (Booths C-4, C-6, D-3, D-5): New Items of interest here will be the M. C. Delineascope, Tillyer Trial Frame, Tillyer Cataract Lens Series, and Stone-Jardon Implant with lateral edge. Displayed also, along with other Spencer Microscopes, will be the AO Spencer Phase Microscope. Other items include absorptive Prescription Lenses, Friedenwald Ophthalmoscope, Giant Retinoscope and Spencer H. B. Meter. AO Representatives will demonstrate and explain.

AMERICAN PHYSICIANS ART ASSN. (Right of Main Entrance): Calling All Physician-Artists! If you plan to exhibit your art works at the American Physicians Art Association Exhibition, write by airmail immediately for full information to Francis H. Redewill, M.D., Secretary, P.O. Box 31, Atlantic City, N. J. Whether you are a Member of A.P.A.A. or not, you owe it to yourself to visit the Art Show sponsored through the courtesy of Mead Johnson & Co.

AMERICAN STERILIZER COMPANY, Erie, Pa. (Booth E-9), will demonstrate the American 1075 Operating Table and DMC track mounted Surgical Light with a live model under actual clinical conditions. The new Davidson-Comper Frame will be introduced. Highlighting this exhibit will be Accommodation of the Prone Position with the entire abdominal-thoracic area in unobstructed suspension on a general operating table. The Alternating Pressure Mattress for control of bed sores on patients bedridden for prolonged periods will be shown for the first time in actual operation for investigation by the profession.

THE AMERICAN SURGICAL TRADE ASSOCIATION, Chicago, Ill. (Booth E-20), will display a large map of the United States showing the location of the 214 surgical dealer members of the Association. It will also distribute a booklet entitled "What's in an Emblem?" which lists the dealer members, gives a brief history of the Association, and outlines the services rendered by members to physicians and hospitals.

AMES COMPANY, INC., Elkhart, Ind. (Booth F-17): Ames Company representatives will be glad to discuss Decholin tablets and Decholin Sodium ampuls, the standard hydrocholeretic agents for the treatment of biliary tract diseases. Another interesting feature will be a demonstration of Clinitest and Hematest—simplified tests for the detection of urine-sugar and occult blood.

ANSCO, Binghamton, N. Y. (Booth L-29), will feature outstanding and interesting radiographs made with both screen and non-screen techniques. A display of Ansco Color transparencies of medical subjects showing the natural and true color reproduction possible with this film and of Ansco Color Printons of medical and other subjects.

APOLLO MANUFACTURING CO., Aurora, Ill. (Booth EP-1)

APPLETON-CENTURY-CROFTS, INC., New York, N. Y. (Booth A-15): Important new books and revisions will be featured by Appleton-Century-Crofts, Inc. Of major importance is the new Operative Technic edited by Warren H. Cole and written by 57 American authorities; the new edition of Wallace Yater's Fundamentals of Internal Medicine; and the recent revisions of Zinsser's Textbook of Bacteriology; Thomson's Nose and Throat; Morrison's Ear, Nose and Throat; and Maingot's Abdominal Operations.

THE ARMOUR LABORATORIES, Chicago, Ill. (Booths C-9, C-11, C-13), extends a cordial invitation to members of the American Medical Association to visit their display of Medical Products of Animal Origin. The following book is available to members of the Assembly: "Function and Malfunction of the Biliary System"—also, descriptive literature on Armour preparations.

THE GORDON ARMSTRONG CO. INC., Cleveland, Ohio (Booth E-11): The Armstrong X-4 Portable Baby Incubator on exhibit here will show the new Thermometer Guard and the Accessory Cabinet which are now available. Close to 8,000 of these Incubators are now in use all over the world. Representatives at the booth will be pleased to answer questions and to offer help to users of the Incubator.

ASSOCIATED MEDICAL CARE PLANS, Chicago, Ill. (Booth G-25), offer an educational and informative exhibit showing the contribution made by the physicians of the United States and Canada in developing and supporting the Blue Cross and Blue Shield Plans, together with a brief summary of the importance of these Plans in making prepaid health available to the public on a prepayment basis.

AYERST, McKENNA & HARRISON, LTD., New York, N. Y. (Booths L-21, L-23): "Premarin" (Estrogenic Substances-water-soluble)—a highly effective and well-tolerated preparation of naturally-occurring, orally-active, conjugated estrogens (equine) will be the focal point of attention here. The potency of "Premarin," expressed in terms of its principal estrogen, sodium estrone sulfate, provides convenience of administration and flexibility of dosage. Four potencies of "Premarin" Tablets and the liquid form will be presented.

C. R. BARD, INC., Summit, N. J. (Booth F-22): In addition to their complete display of Catheters and Drains, C. R. Bard, Inc., will exhibit many items of special interest to doctors other than those specializing in Urology. Among these are Catheters for use in Continuous Spinal and Caudal Analgesia, a new Woven Venous Cannula, and a Double Lumened Tube for Intestinal Intubation specially designed to facilitate introduction and provide maximum drainage. Factory representatives will be in attendance to discuss the development of new items.

BAUER & BLACK, Chicago, Ill. (Booths I-30, J-28), will utilize two separate exhibits. In one, new put-ups of Curity Cotton Balls, gauze sponges, and unique new Kerlix Rolls, all designed for the doctor's office use, will be seen. Also featured, at this exhibit, will be the brand new Rondic Ball type sponge. The other booth will show the popular line of B&B Elastic Goods, including Tensor Elastic Bandage.

W. A. BAUM COMPANY, INC., New York, N. Y. (Booth M-12): The big "news" here will be the Baumanometer Air-Lok Cuff. The simplicity and unique effectiveness of this new bloodpressure cuff is attained by making the air pressure in the rubber bag do the work. No metal part of any kind is employed. The new Phlebaumanometer (Burch-Winsor) for determining the bloodpressure in large and small veins will also be displayed as well as all of the current models of the Lifetime Baumanometer.

BAUSCH & LOMB OPTICAL CO., Rochester, N. Y. (Booths F-6, F-8): A number of important new scientific optical instruments will merit your attention at the Bausch & Lomb exhibit. Included will be the "L" camera for photomicrography; the "E" research microscope with low position, fine adjustments; Flourescence accessories for quick, positive T. B. diagnosis; Phase contrast accessories for examining unstained specimens; also the latest centralized ophthalmic equipment and instruments for refraction, examination, and diagnosis.

RUDOLPH BEAVER, Waltham, Mass. (Booth L-5), will feature a demonstration of the Beaver Knife. Particularly interesting is its non-corrosive stainless steel handle and the versatile interchangeable variety of 13 different blade shapes. This strong, sturdy set is instantly adaptable for superficial cutting or deep surgery and dissection.

BECK-LEE CORPORATION, Chicago, Ill. (Booth E-5), will present the Model ERA Electrocardiograph with the Record Automatic Camera. The Model ERA combines the proven accuracy of the Einthoven quartz string galvanometer and its higher frequency response with the convenience of immediately available cardiograms. The RA Camera delivers a permanently developed electrocardiogram seconds after the heart current has been recorded on the moving photographic paper.

BECTON, DICKINSON & COMPANY, Rutherford, N. J. (Booth D-4), will have their complete diagnostic line ready for inspection at their exhibit. A special feature will be the demonstration of the new B-D Vacutainer Culture Bottle which has gained tremendous popularity in the last few months.

BEDFORD SURGICAL COMPANY, INC., Brooklyn, N. Y. (Booth K-7) will display improved, "approved," and time-tested physicians' office equipment of modern design plus a token cross-section selection of standard brand Council-accepted supplies and equipment. Bedford of service to the medical professional here and abroad for many years will be glad to help you.

J. BEEBER CO., INC., New York, N. Y. (Booths G-3, G-5) will be demonstrating the new model ERA Beck Lee Electrocardiograph, which develops, dries and fixes instantaneously; the new model Mattern SRF with horizontal and vertical fluoroscopy; Hamilton steel and wood furniture; a new Federal Communication Commission approved short wave machine; and the new McKesson BMR.

BEECH-NUT PACKING COMPANY, Canajoharie, N. Y. (Booth L-25) will feature its Strained and Junior Foods which together with all advertising related to such foods, have been accepted by the Council of Foods and Nutrition of the American Medical Association. Nutritionists will be on hand to discuss all inquiries regarding the products as well as any phase of the Company's nutrition program in which you might be interested.

BELL & HOWELL, Chicago, Ill. (Booth I-27) will show their complete line of 8mm and 16mm cameras and projectors, 2x2 slide projectors, editing equipment, sound motion picture projectors, and accessories. The display will feature a demonstration of their new 35mm Foton still camera with the new "T" stop lenses, built in range finder, self-cocking shutter, and automatic film transport.

MARJORIE PEPER BELL, St. Louis, Mo. (West Lobby): An exhibit of particular interest will be that of Creme-Lacquer, the fascinating hairdressing, manufactured and distributed by Majorie Peper Bell. It contains no alcohol, no resin, no rosin . . . is non-stiffening, non-oily, non-sticky, and non-flaking after applying to natural or dyed hair. To your patient—or to anyone in professional, social or business life—the psychological value of boosting morale with assured confidence that his or her hair is attractively groomed with natural looking, shining, youthful highlights is immeasurable. Creme-Lacquer will be displayed in a most artistic manner in two lighted shadow boxes, framed in petal pink and gold.

BELTONE HEARING AID CO., Chicago, Ill. (Booth J-2): The newest model Beltone One-Unit Monopac will be featured in the Beltone Hearing Aid exhibit. Another feature will be the inconspicuous Phantomold. It does away with the need for a receiver button in the ear. The Beltone exhibit will also include the latest electronic equipment for scientific fitting of hearing aids.

THE BEST FOODS, INC., New York, N. Y. (Booth B-9), is exhibiting Nucoa, the wholesome, nutritious, vegetable margarine, which contains 15,000 units of vitamin A to the pound; also on exhibit will be the famous Best Foods—Hellmann's Real Mayonnaise and other Best Foods' products. Miss Elsie Stark, Director of Consumer Education, will be in charge of the booth and will welcome questions about the products.

BIB CORPORATION, Lakeland, Fla. (Booth J-7): This exhibit will dramatize a scale working model of their spotlessly clean plant where Bib orange juice for babies is produced. It will demonstrate how oranges are gently squeezed to avoid excessive peel oil and how juice is specially strained, pasteurized, and hermetically sealed in sterilized containers. The laboratory where continuous tests were conducted and reports made on the Vitamin C content will attract unusual interest.

BILHUBER-KNOLL CORP., Orange, N. J. (Booth C-26): The fine medicinal chemicals, Bromural, Dilaudid, Metrazol, Theocalcin, etc., which fill a most important place in the physician's armamentarium of dependable medication, will be found at the Bilhuber-Knoll exhibit. A visit here will acquaint you with the latest developments among these "Council-Accepted" prescription chemicals which may be prescribed alone or in combinations to meet the needs of the individual patient.

THE BIRTCHER CORP., Los Angeles, Calif. (Booth H-31)

ERNST BISCHOFF COMPANY, INC., Ivoryton, Conn. (Booth M-29, W½), will offer their new Aminophylline Suppository incorporated in an entirely new base that assures stability of the active ingredients. Other Aminophylline products, as well as the amebicide, Anayodin, will be displayed. Trained representatives will welcome your questions concerning these products.

J. BISHOP & CO. PLATINUM WORKS, Medical Products Division, Malvern, Pa. (Booth K-30), will show a full line of "Blue Label" and "Albalon" Hypodermic Needles. The display will feature numerous special needles, including many malleable spinal types, as well as the "Blue Label" Platinum Alloy Needles. The Sempra Syringe—first American-made, interchangeable syringe, will also be on exhibit.

THE BLAKISTON CO., Philadelphia, Pa. (Booth A-3): Be sure to see the product of five years of intensive, scientific work by 100 experts at a cost of $250,000—Blakiston's New Gould Medical Dictionary, the first medical dictionary built on modern lexicographic methods. All branches of medicine and allied sciences are exhaustively covered. Scores of distinctive features make reference easy.

THE BOOK SHOP BINDERY, Chicago, Ill. (Booth B-27): The first glance at this inviting reception room type exhibit will demonstrate how effectively an untidy pile of back copies of medical journals can be converted into a many-sided asset. In this typical background, the attractive rows of handsome, gold-stamped Authorized Bindings claim almost instant attention from the busy physician—suggest the advantages of convenience, compactness, permanence, efficiency, an adequate and accessible library. The low cost and simplified system of handling Authorized Bindings will also win quick approval from the doctor who desires to preserve valuable periodical literature.

THE BORDEN COMPANY, New York, N. Y. (Booths E-8, F-7): A new improved better-than-ever Biolac will be presented here—better physically and more stable. Unchanged are the dilutions, analysis, caloric values, vitamin fortification, and ease of feeding. This new liquid modified milk for infant feeding brings the latest findings of nutritional science at no increase in cost. Presented also will be the long established products, Dryco, Mull-Soy, Klim and Beta Lactose. At Booth F-7, be sure to register for several service items, including some new nutritional literature.

GEORGE W. BORG CORP., Gibbs Div., Delavan, Wis. (Booths L-3, K-4), will exhibit the Mono-Matic Special equipment and a mobile bedside unit. The Mono-Matic Special is a single tube radiographic and fluoroscopic unit comprising a generator rated at 100 MA. at 100 P.K.V., motor driven tilting table and floor-railmounted tubestand. The mobile bedside unit is designed for ease in operation in going through doors, into elevators, etc., and includes a break for use when going down ramps. The self-contained tube head incorporates all the desirable features for equipment of this type, including an overload circuit breaker. It has a capacity of 30 MA. at 80 P.K.V.

JOHN H. BRECK, INC., Springfield, Mass. (Booths J-4, W½), will feature two protective creams- one against oil-soluble substances, the other against water-soluble substances—Breck Hand Cleaner, a mild detergent that cleans without defatting the skin; Breck Hair and Scalp preparations; and Baby Breck preparations. Literature and samples will be supplied on request.

GEORGE A. BREON & COMPANY, Kansas City, Mo. (Booth C-10).

BREWER & COMPANY, INC., Worcester, Mass. (Booth K-2), invites physicians to visit its exhibit which will feature a display of some of the products of its Ampul Division as well as the Tablet Division and two of its specialties, GEL-ETS Oleovitamin A 25,000 units and GEL-ETS Triasyn B. Representatives will be glad to answer any questions concerning these products and arrange for samples and literature to be sent to the physician's office.

BRISTOL LABORATORIES, INC., New York City, N. Y. (Booth F-26).

BROCINER-MASS INSTRUMENTS, INC., New York, N. Y. (Booth B-4, W½): The Clinical Analyzer, a photoelectric colorimeter precalibrated for 70 clinical determinations, will be announced by Brociner-Mass Instruments, Inc. Features are simplicity, ruggedness, and ease of use, affording precision measurements at unprecedentedly low cost for a precalibrated instrument. A loose-leaf, printed instruction manual containing calibrations for 70 clinical determinations, includes detailed instructions for the chemical procedures.

THE BURDICK CORPORATION, Milton, Wis. (Booth B-23), will display its line of Physical Medicine Equipment, including Short Wave Diathermy, Ultra-violet and Infra-red Lamps and the Rhythmic Constrictor. A feature of special interest will be their new Direct-Recording Electrocardiograph. Doctors are invited to inspect this modern equipment for use in physical medicine.

BURNS CUBOID COMPANY, Santa Ana, Calif. (Booth D-32): In addition to the masonite lighted display which has become a symbol for foot comfort to doctors visiting A. M. A. conventions, the Burns Cuboid display will also feature alternating flasher signs. These show the anatomical raises of the Cuboid pictorially outlined against a background of A. M. A. and Good Housekeeping emblems.

BURROUGHS WELLCOME & CO. (U. S. A.) INC., New York, N. Y. (Booths K-18, K-20): Something decidedly different will be seen at the Burroughs Wellcome exhibit. It is a striking and colorful seven foot mural called "The Progress of Medicine," depicting the five main ages of man (Primitive, Greek, Dark Ages, Renaissance and Modern) and his progress in the treatment of disease from primitive magic to the approach of modern science.

BURTON MANUFACTURING COMPANY, Chicago, Ill. (Booth G-11), will feature several new and interesting items, among them the Duffle Photometer which introduces a new visual method for the determination of hemoglobin, blood, sugar, urea acid, sulpha, penicillin, etc., in the blood stream. Burton will also feature the Newman Myometer. It is claimed that the strength of muscles in the fingers, hands, arms, legs, feet, toes, neck, shoulders and many other muscles can be very accurately measured. In addition, Burton will also show their full line of F-L-O-A-T-I-N-G Arm Lights which they have been featuring since the first of 1919.

CALGON, INC., Pittsburgh, Pa. (Booth E-1): A great aid to soap in attaining healthful cleanliness is demonstrated by Calgon, Inc., in the redissolving of hard water deposits by Calgon. Calgon eliminates soap film, assures brighter, softer clothes, cleaner dishes, and scum-free personal bathing. In mechanical dishwashing Calgonite, compounded of Calgon and alkali, solves the sanitation problem arising from film-retained soil.

CAMBRIDGE INSTRUMENT COMPANY, INC., New York, N. Y. (Booth M-10): Important developments in Cambridge instruments will be on view. Cambridge Electrocardiographs and Electrocardiograph-Stethographs will be on display in "Simpli-Trol" Portable and "All Electric" Mobile models. Included in the exhibit will be the Cambridge Research pH Meter, the Cambridge Electrokymograph for recording heart border motion, and the Cambridge Plethysmograph which furnishes standardized, quantitative and reproducible records. New Cambridge instruments for measuring radioactivity will also be shown.

CAMEL CIGARETTES, New York, N. Y. (Booths H-8, I-7), wil feature color slides of background data from their newest research. After weekly examinations of the throats of hundreds of men and women smoking Camel Cigarettes exclusively for thirty days, throat specialists reported "Not one single case of throat irritation due to smoking Camels."

CAMERON SURGICAL SPECIALTY CO., Chicago, Ill. (Booths D-9, H-1): Among the items demonstrated at the Cameron exhibit will be the new Suction Coagulation Handle and numerous accessories for all phases of Electro-Surgery, Electro-Cauterization, Electro-Coagulation, Desiccation and Fulguration; Cameron Surgical Units; Electro-Diagnostic Lamp and Instrument Outfits; the new stainless steel Boros Flexible Esophagoscope and other Peroral and Dualite Sigmoido- Mirrolite and other Loupes; Illuminated , Retractors and other Instruments for all types of diagnosis, treatment and surgery.

S. H. CAMP & COMPANY, Jackson, Mich. (Booth H-15): A series of illuminated transparencies will depict various anatomical conditions before and after application of Camp Scientific Supports. The complete line of Anatomical Supports for prenatal, postnatal, visceroptosis, sacro-iliac, hernia and other specific conditions will be shown. Experts from the Camp staff will be in attendance to answer questions.

CANADIAN RADIUM & URANIUM CORP., New York, N. Y. (Booth B-20): American Refined Radium, now available in any form and in any type of container, and "Old Radium exchanged for new" will highlight this absorbing exhibit. A complete line of Radium instruments, accessories, and protective equipment will be shown, as will the new type Radium "D" applicator for treatment of certain Ophthalmic conditions.

CARNATION COMPANY, Los Angeles, Calif. (Booth F-23), will have an attractive display on Carnation Evaporated Milk—"the milk every doctor knows." Some valuable information on the use of this milk for infant feeding, child feeding, and general diet will be presented and the method by which Carnation is generously fortified with pure crystalline Vitamin D—400 U.S.P. units per reconstituted quart—will be explained. Interesting literature will also be available for distribution . . .

WILMOT CASTLE COMPANY, Rochester, N. Y. (Booths J-6, J-8): At the Castle booth will be shown all that is modern and new in sterilizing and professional lighting equipment. There will be a complete range, including items for the Physician, the Clinic, the small hospital, and the large institution. Oil as a sterilizing medium for all instruments, and pressure sterilization will be featured. The exclusive Castle Safety Light, which is explosion proof, will be shown, and its need in hazardous locations will be explained.

CENTRAL PHARMACAL COMPANY, Seymour, Ind. (Booth M-6), will present their new and improved triple-sulfa preparations—the Trisulfazine line, which includes tablets, (for adults and children) and the suspension. Also on display will be their Synophylate, or Theophylline-Sodium Glycinate line; and Suspension and Tablets Restrol (brand of Dienestrol). Scientic literature and folders containing excerpts and reprints from the latest medical journals will be supplied.

CERTIFIED BLOOD DONOR SERVICE, Jamaica, N. Y. (Booth E-23), plan to exhibit many items for use in hematology and serology. These range from Anti-A, Anti-B, and Anti-Rh blood typing serum to the Anti-human globulin rabbit's serum for the Coombs' test, lyophilized guinea pig complement, preserves sheep cells and a number of new items used in the laboratory for testing purposes never before offered in a commercial way.

CHURCH & DWIGHT CO., INC., New York, N. Y. (Booth I-19): The use of Arm & Hammer and Cow Brand Baking Soda as a dentrifice will be emphasized in the Church & Dwight exhibit. Colorful little booklets suggesting its application in cleaning teeth will be on display and handy pocket-sized samples especially suitable for traveling may be had at the booth.

CIBA PHARMACEUTICAL PRODUCTS, INC., Summit, N. J. (Booth A-10): The Ciba exhibit features Pyribenzamine, an established antihistaminic for allergic relief with minimal side effects. Experienced Professional Service Representatives, in attendance, invite inquiries about this and other important Council-Accepted products manufactured by Ciba.

THE CILKLOID CO., Marshalltown, Iowa (Booth B-1): Plastic surgeons and other physicians interested in skin grafting will want to stop here and learn more about the use of Non-Adherent Perforated Cilkloid dressing material. The impervious Cilkloid will be demonstrated for protective dressings. All Philatelists are invited to rest at Booth B-1 and look over an interesting display.

CLAY-ADAMS COMPANY, INC., New York, N. Y. (Booth M-8): New developments in laboratory and surgical instruments, as well as Medichromes, 2x2" 35 mm. Kodachromes in the medical sciences—and other visual aids such as anatomical models, skeletons, charts—will be displayed. Special emphasis will be given the equipment for Cytological diagnosis of cancer, the Brown Blood Typing and Cross Matching Board, and a new series of Rotators for Sero-diagnostic Tests."

CLERSITE COMPANY, Chicago, Ill. (Booth L-2): For "clearer vision" be sure to stop here where an attendant will clean your glasses perfectly. He will also show you many other ways in which Clersite can aid the physician in keeping spectacles from fogging during operations, mirrors free from condensation during laryngeal examinations, windshields clean, etc.

THE COCA-COLA COMPANY, Atlanta, Ga. (Lounge F-29): A cordial reception awaits physicians and their friends here where ice-cold Coca-Cola will be served through the courtesy and *cooperation of the Coca-Cola* Bottling Company of Atlantic City and The Coca-Cola Company.

WARREN E. COLLINS, INC., Boston, Mass. (Booth E-12): You will not want to miss the display and demonstration of the new Collins Metabolex, a dry metabolism tester for simple, accurate BMR's; the Collins Respirometer, a new apparatus especially designed for lung function studies or routine clinical metabolism tests; and the Drinker-Collins Duplex Respirator, fully equipped with a new auxiliary *resuscitator. Courteous technicians* will welcome your inquiries.

COLWELL PUBLISHING COMPANY, Champaign, Ill. (Booth D-1): Complete medical records, attractively and logically designed—that's the keynote of the Colwell line. *Patients' histories* and accounts are easy to keep; the Daily Log for Physicians provides the basis for keeping track of the business side of a practice. You will want to examine the Daily Log and case history forms, and discuss your individual needs with experienced representatives.

C.S.C. PHARMACEUTICALS, New York, N. Y. (Booth K-24), will display a number of pharmaceutical preparations in addition to their line of penicillin. Representatives of the Medical Department will be in attendance for discussion with physicians.

COMPASS TRAVEL BUREAU, INC., New York, N. Y. (Booth B-30, E½): Following the success of the First Medical Tour to Europe, the Compass Travel Bureau, Inc., the Travel Agency of the American Physician, announces its Second Tour leaving on the S.S. Caronia, August 11. Also scheduled is a five week goodwill tour of South America leaving from Miami, December 17 via Pan American Airways. All information concerning these tours and a preview of medical travel in 1950 will be available at the booth.

CONFORMAL SHOE COMPANY, St. Louis, Mo. (Booth L-24): Members of the medical profession are invited to see how Conformal's exclusive built-in plastic insole is moulded to the individual arch requirements, thus affording better support and better body balance. Some *of Conformal's newest styles for men and women* will be on display. The Conformal line has been expanded greatly in recent years to include many additional dress-up types, as well as the basic walking shoes, all with the special plastic insole.

CONTINENTAL X-RAY CORP., *Chicago, Ill.* (Booths I-3, I-5): With many original and unique features, Continental X-Ray will present for the first showing: The new "Panelmatic 250," a general diagnostic unit with new Automatic Wall Control, new Tubestand, and a new Motor Drive Table. The new "Flexray," popular, *low-cost, all-purpose x-ray unit,* for general radiography and fluoroscopy will deserve your special consideration.

COOPERATIVE MEDICAL ADVERTISING BUREAU, Chicago, Ill. (Booth A-2): Copies of the 34 state medical journals, members of the Bureau comprising the State Journal Group, will be on display. Representing 42 state medical associations, these publications follow the A.M.A. high standards in acceptance of advertising. Prospective advertisers may secure sample copies, rates, and other information at the booth. Also offered are "Advertising Service," a booklet outlining the services performed for both advertisers and advertising agencies, and the Budget Suggestions which offer 29 different plans for coverage in the entire group of publications.

CORECO RESEARCH CORP., New York, N. Y. (Booth M-29, E½), will demonstrate the *Coreco* Camera, designed to photograph surface areas of the body—from 1 to 1 close-up pictures to half-body size—and cavities, such as mouth, throat, ear, nose, vagina, and rectum. This novel camera carries its own specially developed, fully color-corrected bulb and a mechanism for complete control of its color temperature and exposure within the camera itself. There is an automatic view finder synchronized with the automatic camera mechanism to permit viewing until a fraction of a second before exposure and to provide for automatic focusing.

CORN PRODUCTS SALES COMPANY, New York, N. Y. (Booth K-26).

COUNCIL ON WHITE MINERAL OIL, Chicago, Ill. *(Booth I-13): A new booklet reporting the* latest clinical findings, and physicians' statements on Mineral Oil, will be distrbuted by the Council on Mineral Oil. Copies of the Council's advertisements, pointing out the beneficial uses of the laxative, will line the walls. A sample bottle of Mineral Oil will be offered. Dr. William I. Fishbein, Secretary of the Council, will be in charge.

THE CREAM OF WHEAT CORP., Minneapolis, Minn. (Booth L-28): The familiar Regular Cream of Wheat will merit your attention here. You may register at the booth for your copy of their Vitamin Food Chart; Baby Book or Leaflet, "Common Sense Feeding Habits For Your Baby;" and a booklet on special diets for bland feedings.

CURVLITE PRODUCTS, INC., Port Chester, N. Y. (Booth K-3).

CUTTER LABORATORIES, Berkeley, Calif. (Booths K-27, 29): On display here will be the Cutter line of Intravenous Solutions in Saftiflasks with the latest expendable equipment for administration. The most recent *advances and additions to the blood fractions* group of products, as well as their improved Alhydrox immunizing agents, will also be shown for your inspection.

DAVIES, ROSE & CO., LTD., Boston, Mass. (Booth L-19): Cardiologists and other physicians *will be particularly interested* in the preparations displayed by Davies, Rose. Special emphasis will be placed on their Digitalis Pills, wellknown for treir constant and dependable potency. Well-posted representatives will be pleased to have you stop by.

F. A. DAVIS COMPANY, Philadelphia, Pa. (Booth C-7): Interesting new editions and new books on display here will include: The Cyclopedia of Medicine, Surgery and Specialties; Behrend, The Gallbladder and Allied Structures; Bach, Arthritis and Related Conditions; Greenbaum, Dermatology; Judd, Diseases Of The Chest; Malinlac, Rhinoplasty; May, Reparative and Reconstructive Surgery; Troncoso, Gonioscopy; Reimann, Treatment in General Medicine, etc.

DAVIS & GECK, INC., Brooklyn, N. Y. (Booth E-2), manufacturers of sterile surgical sutures, will offer a wide range of suture materials and suture-needle combinations specially prepared for every type of surgery. Literature available will include the D&G Manual, Suturegrams, booklets and leaflets on sutures and wound healing and various reprints. Technical and product information will also be available from company representatives in charge.

DAVOL RUBBER COMPANY, Providence, Rhode Island (Booth K-23).

MRS. DAY'S IDEAL BABY SHOE COMPANY, *Danvers, Mass. (Booth H-21), will show* new styles and materials—made to scientific standards. Lasts have been improved to add to the attractiveness but still retaining the correct length, height and width for the natural development of the baby's feet. Trained registered nurses will be in attendance to be *as helpful as possible to the doctors.*

THE DENVER CHEMICAL MFG. CO., INC., New York, N. Y. (Booth H-6): Galatest for the instantaneous determination of urine sugar, and Acetone Test (Denco) for the detection of acetone in urine will be exhibited here. You *will be especially interested in a demonstration* of these "spot tests" for sugar and acetone. Galatest and Acetone Test (Denco) offer advantages of accuracy, simplicity and economy in routine urinalysis.

DEPUY MFG. COMPANY, Warsaw, Ind. (Booth *B-26): Latest designs in Fracture Appliances* will highlight the De Puy exhibit. Sherman bone plates, Smith-Petersen nails, Lorenzo Half-Thread hip screws, and other items for internal fixation of bones—all made of S.M.O. Stainless Steel—will also merit your attention. A complete line of modern splints for the General *Practitioner will be on display.*

DEVEREUX SCHOOLS, Devon, Pa. and Santa Barbara, Calif. (Booth D-13), is designed to meet the needs of physicians whose patients require a specialized educational program. The emotionally disturbed child with average or susperior intelligence, as well as the slow-learning child, is provided with a well-rounded program of academic, vocational, social, and physical training. Resident medical, psychiatric, and psychological personnel insure intensive, as well as supportive, therapy where indicated. Physicians are cordially invited to discuss the educational problems of any of their patients with representatives at the Devereux Booth.

THE DeVILBISS COMPANY, Toledo, Ohio *(Booth I-8): Instruments for atomization* and nebulization therapy will be displayed, including a hand pump designed for the inhalation of aerosols at home, in a simple and inexpensive manner. Kodachrome transparencies depicting the distribution of aerosols in the lungs and bronchi will be featured. This data *supports clinical findings and experimental work* with aerosols of penicillin, streptomycin, epinephrine and other substances.

THE DIETENE COMPANY, Minneapolis, Minn. (Booth B-13): At the Dietine Company exhibit you will see Meritene, the fortified whole protein supplement, that is really palatable and reasonably priced. Dietene, a "Council-Accepted" Reducing Supplement will be on display too. Complimentary copies of the free personal-type Diet Service will be available to physicians. The diets look as if they were typed in your office for each individual patient.

DOAK COMPANY, INC., Cleveland, Ohio (Booth M-13), will demonstrate Tersus, an aliphatic lotio. Clinical experience by many dermatologsts indicates Tersus to be a dependable detergent free from bilateral effects on the skin. In *actual practice* Tersus *has proven to be free* from irritating factors. Adding Tersus to a bath will prevent formation of the undesirable function of a ring around the tub.

DUKE LABORATORIES, INC., Stamford, Conn. (Booth F-21), will display Elastoplast, stretch*able, adhesive-surfaced bandages and unit* dressings; Gelocast, prepared Unna-paste bandage; Nivea Creme, Nivea Skin Oil and Basis Soap—the "Prescriber's" Cosmetics; and Aquaphor, hydrophylic ointment base.

E. I. DU PONT DE NEMOURS & CO., INC., Wilmington, Delaware, (Booth D-25, D-27): Du Pont x-ray films and processing chemicals will be the features of this exhibit, and "Patterson" intensifying and fluoroscopic screens will be shown. Actual radiographs will be displayed. An interesting sidelight will be the general company exhibit—"What's New From Du Pont," which will show new products introduced by all of Du Pont's Industrial Departments during 1947-'48-'49.

DUREX PRODUCTS, New York, N. Y. (Booth M-28): A most extensive line of A.M.A. accepted contraceptive devices and preparations will be displayed for your examination and approval by Durex Products, Inc. Here you will be able to inspect Bow-Bend, Dumas, Duraflex, Mensinga and Durex Coil Spring Diaphragms, four types of diaphragm inserters and, of course, Lactikol Jelly and Lactikol Creme. Unique combination sets for convenient dispensing will be demonstrated.

E & J MANUFACTURING CO., Glendale, Calif. (Booth H-27): New E & J developments in respiratory equipment will be displayed here, as well as various models of the E & J *Resuscitator-Inhalator-Aspirator.* Resuscitation of infants will be dramatized by the use of E & J equipment on a plastic doll in which the functioning of the lungs can be observed.

EASTMAN KODAK COMPANY, Rochester, N. Y. (Booths G-6, G-8): The role of Kodak *in radiography and medical photography will* be featured at the Kodak exhibit. Included along with an interesting display of radiographs will be three major Kodak products for radiography—Kodak Medical X-ray Films, Kodak X-ray Intensifying Screens, and Kodak X-ray Processing Chemicals. Interesting photo*graphic transparencies in full color will* illustrate the theme "Picture the Patient's Progress." Of especial interest in the display of Kodak equipment for medical photography will be the new Kodaslide Table Viewer.

EATON LABORATORIES, INC., Norwich, N. Y. *(Booth A-30): The Eaton staff will be glad to* discuss recent advances in the use of the new topical antibacterial agents: Furacin Soluble Dressing and Furacin Solution. Also on display will be Aspogen, the basic aluminum salt of the amino acid glycine, for treatment of peptic ulcer. Reprints of the recent clinical investiga*tions of Lorophyn Suppositories and Lorophyn* Jelly will be available.

EDIN ELECTRONICS COMPANY, Worcester, Mass. (Booth A-11), will exhibit a line of Ink-Writing Electrocardiographs and Ink-

Writing Electroencephalographs. They will also feature special Electromedical research equipment. The Edin engineers will be on hand to welcome present and prospective users and to answer questions regarding the use and performance of Edin equipment.

THOMAS A. EDISON, INC., New York, N. Y. (Booth L-30), will present its famous and complete line of disc and cylinder electronic dictating equipment embodying exclusive ear-tuned jewel-action so necessary for medical dictation. High light of the exhibit will be the New Disc Edison Voicewriter enclosed in clear plastic so that you may see the inside store of luxury performance in action.

THOMAS A. EDISON, INC., (Medical Gas Div) Stuyvesant Falls, N. Y. (Booth WP-1).

J. EDWARDS & CO., Philadelphia, Pa. (Booth L-4): A very interesting exhibit of children's shoes for all ages from tots to teens will be on display for your examination. Pre-walking shoes for babies, first step shoes for babies, dress shoes, school shoes and special types of shoes for children with pronations, weak arches, etc. will be included in the exhibit. Edwards have been exclusive manufacturers of children's shoes since 1900.

EISELE AND COMPANY, Nashville, Tenn. (Booth H-5), will feature their new Interchangeable Syringe, as well as their usual line of Hypodermic Syringes, Needles, and Clinical Thermometers. A new type metal tip syringe on which no cement is used will be shown.

EKCO PRODUCTS COMPANY, Chicago, Ill. (Booth WP-3).

ELECTRONIC SURGICAL EQUIPMENT CO., INC., Philadelphia, Pa. (Booth A-27, N½): Exhibited here will be the Radiosurg Scalpel Operating Unit (fully rectified construction), a portable radio frequency surgical apparatus of advanced engineering design. This precision instrument permits the use of varied electronic surgical methods to meet the minor surgical needs of the general physician, proctologist, gynecologist, or surgeon. Constructed according to exacting specifications, it supplies ideal current characteristics.

ELECTRO-PHYSICAL LABORATORIES, INC., New York, N. Y. (Booth L-10): Physicians, especially those interested in cardiology, should not miss this display of cardiac diagnostic and [illegible] PC-2 Pioneer [illegible] a Six-Chan[illegible] radical application of electronics to diagnostic medicine, including the direct-writing Heart Sound Analyzer with unusually high frequency response; the Cardioscan, a visual sampling electrocardioscope; a radically new Electroencephalograph Analyzer, permitting continuous count and integration of frequency components; and a new Blood Sedimentation Rate Meter.

J. H. EMERSON CO., Cambridge, Mass. (Booth B-25): New features of the familiar Emerson Respirator include several attachments to make care of patients easier. Simplified devices for maintaining artificial respiration while a respirator is open; accessories for care of patients requiring tracheotomy (including a humidified-oxygen insufflator); and devices for varying the pressure curve and sequence of pressures obtainable will be shown. Also on exhibit will be Emerson Resuscitators, the Emerson Lung Immobilizer, and the new Hot Pack Apparatus.

ENCYCLOPAEDIA BRITTANICA, INC., Chicago, Ill. (Booth EP-4): This venerable reference work that is eight years older than the declaration of independence and 65 years older than the city of Chicago, where it has been edited and printed for many years, will merit a "stopover" on your tour. It was published in 1768 by a "Society of Gentlemen," in Edinburgh. Today the 24 volume set is written by experts all over the world, including Albert Einstein and George Bernard Shaw. In co-operation with specialists at the University of Chicago, with which Britannica is affiliated, articles are constantly surveyed to keep them abreast of modern events and discoveries. Top authorities then do the writing for the frequent new printings.

ENDO PRODUCTS, INC., Richmond Hill, N. Y. (Booth G-27): A noteworthy addition to the Endo exhibit will be Hycodan Bitartrate, a newly developed antitussive possessing the cough depressant property of codeine but requiring smaller doses for an effective therapeutic action. Other Endo Council-accepted products to be featured are Mesopin, a gastrointestinal antispasmodic providing atropine effects without atropine side effects, and Norodin Hydrochloride, an improved psychomotor stimulant and antidepressant.

ETHICON SUTURE LABORATORIES, New Brunswick, N. J. (Booth K-17), will feature its new line of Ethicon Atraloc Needles in Sterile Pack and Standard Pack packages, developed through several years of intensive research of surgeons' needle needs. These needles will be dramatized by a new Ethicon exhibit featuring a novel transparent plastic display wheel, containing Ethicon needles embedded within the plastic. This wheel will revolve, bringing each needle in turn before a three power magnifying glass and permitting microscopic scrutiny by the exhibit's viewers.

EUREKA X-RAY TUBE CORPORATION, Chicago, Ill. (Booth J-25), will be very pleased to meet members and friends attending the convention at their exhibit. A full line of x-ray tubes as used for radiography, superficial and deep therapy will be on display. Your special attention is directed to the stainless steel rotating anode tube, which is guaranteed for 20,000 exposures.

EVAPORATED MILK ASSOCIATION, Chicago, Ill. (Booth L-13): Be sure to register with the Evaporated Milk Association, at Booth L-13, for a free copy of "Infant Feeding with Evaporated Milk," a manual for physicians on the use of vitamin D fortified evaporated milk in infant feeding. Other publications on the properties and uses of evaporated milk in child nutrition, maternal welfare, social welfare, public health and general nutrition will be on display. These publications, available without charge, are designed for professional people, and for distribution to those whom they serve.

EXERCYCLE CORP., New York, N. Y. (Booth J-32), will display a new cycle designed for use in the treatment of disability and as an aid in the overall adjunctive therapy of neuropsychiatric conditions. Its variable speeds provide optional pedal action against a brake, with resistance registered on a graduated scale, adjustable pedal radius and adjustable seat.

EXPERT BEDDING CO., Chicago, Ill. (Booth I-28): The keynote of this exhibit will be Bedding Dust, its Reduction and Elimination from a dust-sensitive patient's environment. On exhibit will be a complete display of "Altex" Hypo-Allergenic casings and allied bedding products; also the "Ilgairator," a window air filter. Descriptive literature will be available at the booth.

FANCEE FREE MFG. CO., St. Louis, (Booth H-28): Your maternity patients will really enjoy wearing the Fancee Free Garter Belt demonstrated here. Not only during pregnancy, but long after as the garment is also excellent for general wear. This all elastic garter belt fits around the waist in back and below the abdomen in front, thus eliminating all pressure.

H. G. FISCHER & CO., Franklin Park, Ill. (Booths L-26, M-25), will present for your inspection their modern, outstandingly efficient yet low priced x-ray and physical therapy equipment. Let them point out the many features of advantage in these representative units and other models not on display. H. G. Fischer & Co.'s 38 years devoted solely to designing and manufacturing x-ray and physical therapy equipment help make them a leader in this field and assure products of dependable performance and great durability. Your visit will be welcome.

FISHER-STEVENS SERVICE, INC., New York, N. Y. (Booth A-27, S½): This exhibitor maintains a list of all practicing physicians and interns in the United States. The list is used by pharmaceutical manufacturers, book publishers, and equipment makers for the distribution of direct mail advertising. If you have changed your address recently stop by and tell them about it, in order to make certain that your mail is received with no delay.

C. B. FLEET CO., INC., Lynchburg, Va. (Booth H-26), will feature Phospho-Soda (Fleet) which has been an ethical product for over half a century. This is a pure, stable, aqueous concentrate of the two U.S.P. sodium phosphates. It is indicated in hepatic and gallbladder dysfunction and whenever a thorough eliminating action is desired. It possesses rapidity and mildness of action with marked absence of nausea, griping or tenesmus.

FLINT, EATON & COMPANY, Decatur, Ill. (Booth I-24): The introduction of Choline therapy in early and late cirrhosis of the liver is one of the most interesting of recent medical developments. An easy and palatable way of administering Choline to your patients will be featured at Flint, Eaton & Company's booth. An up-to-the-minute edition of a very comprehensive digest on the present status of Choline therapy will be available. Interesting and unusual color photographs of liver pathology will also be featured.

FLORIDA CITRUS COMMISSION, Lakeland, Fla. (Booth J-13): Orange Juice will be served by representatives of the Florida Citrus Commission. This juice will be reconstituted from frozen orange concentrate which has been heralded as one of the "hottest" items in the frozen food field. The exhibit contains five animated dioramas depicting the preparation of citrus from tree to consumer.

FOLEY MFG. CO., Minneapolis, Minn. (Booth D-10): At this exhibit you may see an interesting demonstration showing how the Foley Food Mill saves time and food for the homemaker in the preparation of fresh cooked vegetables and fruits for all smooth diets.

THE FOREGGER COMPANY, INC., New York, N. Y. (Booth C-29), will exhibit a number of unique items including specially designed CO_2 Absorbers and Endotracheal Equipment as used in the Blalock Operation, and a new Portable Anesthesia Apparatus about the size of a press photographer's camera and not much heavier. This Equipment will be in addition to the latest in Anesthesia Apparatus for Hospital use.

GASTRO-PHOTOR LABS., CORP., New York, N. Y. (Booth K-13), will feature the No. 500 model of the Gastro-Photor—"the camera for photographing the interior of the stomach." Sixteen gastrophotographs are provided with one exposure of this stomach camera which make possible the diagnosing of ulcers hidden within rugal folds or in locations inaccessible to X-Ray observations. Samples of actual gastrophotographs will be available for your observation.

GENERAL ELECTRIC CO., Cleveland, Ohio (Booth D-22): Germicidal lamps, recently accepted by the A.M.A.'s Council on Physical Medicine for the disinfection of air in hospitals, nurseries and operating rooms, will be the center of attraction here. A special display will demonstrate how ultraviolet radiation from germicidal lamps prevents the growth and spread of mold. Also to be shown are G-E photographic lamps, and health lamps in the form of sun and heat lamps.

GENERAL ELECTRIC X-RAY CORPORATION, Milwaukee, Wis. (Booths D-17, D-19, D-21), will exhibit their new Model E Inductotherm, a moderately priced high output diathermy unit which culminates 15 years of development of the original Inductotherm. Also shown will be the Cardioscribe, a direct writing, portable electrocardiograph that gives permanent records without darkroom delay. In addition, several types of radiographic and fluoroscopic equipment will be exhibited.

GENERAL FOODS CORPORATION, New York, N. Y. (Booths J-26, L-8), is looking forward to the Convention, and eagerly anticipates the opportunity it presents to greet old friends and to make new acquaintances. At one of their booths registrants will be served a cup of delicious Instant Sanka Coffee—an instant decaffeinated coffee; at the other, a cooling Postum Milk Shake. Nutritionists are prepared to discuss Diamond Crystal Iodized Salt, D-Zerta, and Post Cereals.

GERBER PRODUCTS CO., Fremont, Mich. (Booth H-25): Strained Foods, Junior Foods, Pre-cooked Cereals, and the new Gerber-Armour Meats for Babies will comprise this exhibit. Your inspection of their service materials on infant feeding and adult special diets, particularly the newly revised and enlarged Special Diet Recipes booklet, will be welcomed.

GOMCO SURGICAL MANUFACTURING CORPORATION, Buffalo, N. Y. (Booth I-11) will feature their new Aerosol Penicillin pump, the Tidal Irrigator and Cystometer, and a complete line of physicians' office suction, suction and ether and suction and pressure treatment units. Of particular interest to Public Health officers will be the 788FS, a compact compressor especially equipped for drying children's teeth before and during the application of fluorine preparations.

GOODMAN-KLEINER CO., INC., New York, N. Y. (Booth L-32): Physicians treating marital infertility are invited to witness actual demonstrations of the new improved editions of those uniquely successful instruments the Weisman Gynograph and Gynogauge. The improvements are radical, and have built-in pressure controls which assure optimum safety. In addition, this company is proud to announce its appointment as exclusive distributors of the Goldman-Belskie Anatomical models, which can be palpated. These models will be on display.

B. F. GOODRICH COMPANY, Akron, Ohio (Booth L-27): A "Miller" brand surgeon's glove manufactured by the celebrated Anode process and inflated to 30 times its normal size is the featured attraction of this exhibit. The distended glove tells its own dramatic story regarding strength, uniform thickness, highest quality rubber used in its construction. The general line of surgical rubber products which the B. F. Goodrich Company manufactures are also included in the exhibit. These are surgical tubes, tubing, catheters and other sick room supplies made of rubber.

GRADWOHL LABORATORIES, St. Louis, Mo. (Booth C-30), will demonstrate its various activities: the manufacture of laboratory reagents, including blood grouping sera, stains for the Papanicolaou method, Giemsa (Commission Certified) stain, etc.; the training of laboratory technicians; publication of a monthly journal, The Laboratory Digest—a running account of the advances in laboratory medicine; and promotion of the fourth edition in three volumes of the standard reference book of laboratory diagnosis, entitled, Clinical Laboratory Methods and Diagnosis (a Mosby publication). Visitors are requested to register for publications issued by this company.

GRASS INSTRUMENT CO., Quincy, Mass. (Booth M-31), manufacturers of Electroencephalographs and electrophysiological equipment since 1935, will exhibit the latest in Electroencephalographs, Model III-C. Accessory devices for operating room use will also be [illegible] present to advise [illegible] tallation and use of [illegible] Information on [illegible] and amplifiers will be available.

GRUNE & STRATTON, INC., New York, N. Y. (Booth B-17): Among the many G & S books to be shown at the exhibit, the following 1949 publications deserve your special attention: Sigler, Cardiovascular Disease; Minot, Symposium of Hematology; Crohn, Regional Ileitis; Iason, Synopsis of Hernia;; Davis, Shock and Allied Forms of Failure of the Circulation; Wespi and Schiller, Early Carcinoma of the Uterine Cervix; Wiener, Surgery of the Eye, Second Edition; Sommers, Histology and Histopathology of the Eye, Hoch and Zubin, Psychosexual Development In Health and Disease; Bergler, The Basic Neurosis; Rosenzweig, Psychodiagnosis.

HAMILTON MANUFACTURING COMPANY, Two Rivers, Wis. (Booths K-9, K-11): You will want to examine the three suites of Examining Room Furniture displayed here. Deluxe NuTone, the distinctive and modern NuTrend, and the professionally styled Steel-Tone. Also shown will be the No. 9905-BAP All-Purpose Examining Chair-Table and representative items of business office and reception room furniture.

HANOVIA CHEMICAL & MFG. COMPANY, Newark, N. J. (Booth F-25): A complete line of self-lighting ultraviolet quartz lamps for orificial and body irradiation, Sollux Radiant Heat Lamps, as well as germicidal quartz jacketed models will be demonstrated and displayed. Competent and courteous representatives will be at your disposal.

THE HARROWER LABORATORY, Glendale, Calif. (Booth M-4): Mucotin, the mucin antacid, is presented at the Harrower technical exhibit. Gastroscopic illustrations show the coating action of Mucotin on a large gastric ulcer. A case history report of a patient with a gastric ulcer and the response to treatment is demonstrated with gastroscopic pictures. Gastric acidity control studies with various antacids are graphically presented. Literature and samples will be available at the exhibit.

H. J. HEINZ CO., Pittsburgh, Pa. (Booth M-9): Heinz Strained and Junior foods will interest doctors concerned not only with the feeding of infants and toddlers but also of adults. These foods are gaining rapid acceptance for special diets in gastro-intestinal disturbances, geriatrics, and other conditions where strained and junior foods are required.

PAUL B. HOEBER, INC., Medical Book Department of Harper & Brothers, New York, N. Y. (Booth A-26), will display their entire distinguished list of medical and scientific books. New Hoeber-Harper titles of outstanding importance include Coley's Neoplasms Of Bone; Ritvo's Roentgen Diagnosis Of Diseases Of The Skull; Barrow's Varicose Veins; Gesell and Ilg's Vision; Harris' Psychological Medicine, and Berliner's Biomicroscopy Of The Eye. This year there are many new editions of standard Hoeber-Harper volumes such as Kaplan, Radiation Therapy; Alvarez's Introduction To Gastroenterology; Fowler's Hematology and Hamilton and Hardy's Industrial Toxicology. Visit the Hoeber booth to see many of today's most important medical books.

HOFFMANN-LA ROCHE, INC., Nutley, N. J. (Booth C-17), will devote its exhibit exclusively to their Council-Accepted specialty, Prostigmin. The many recognized uses of Prostigmin are always of interest to physicians. A staff of experienced representatives will be pleased to have you stop by for a discussion of Prostigmin and other Roche specialties. Your visit will be most welcome.

HOLLAND-RANTOS COMPANY, INC., New York, N. Y. (Booth D-30).

HOLLISTER-STIER LABS., Spokane, Wash. (Booth D-20): "Specialists" in allergenic products for diagnosis and treatment, members of the staff will be available to answer specific questions pertaining to this firm's Personalized Allergy Service of nation-wide scope. Testing sets for pollen and other allergenic extracts will be displayed along with therapeutic extracts and treatment dilutions. Accessories for office and laboratory use will be demonstrated, and an opportunity given to reserve a copy of Allergy Handbook, pollen survey, and sundry items.

WILLIAM S. HORN COMPANY, Fort Worth, Texas (Booth M-30, W½): Visitors here will have an opportunity to inspect the Hospital Bedhight Bedpan Commode, a device to be used by patients occupying hospital beds. The commode seat is at the level of the mattress so that patients may have the comfort of normal stooling posture with a minimum of effort. Any patient who may sit or who is allowed the backrest should have the comfort and convenience of this commode. It is desirable in handling obstetrical and surgical patients during early post-operative days and promotes early ambulation. It is of especial value in handling cardiac invalids and more particularly, the obese patient. The commode vessel is a standard hospital bedpan. Both portable and cabinet-table models will be exhibited.

HOSPITAL LIQUIDS, INC., Chicago, Ill. (Booth C-5), will show its complete line of Shaw solutions and Haemovacs, blood and RH typing sera, Coagusol and disposable sets. The new Steri-Pak Seal built into each bottle of solution showing positive proof of sterility will be featured and demonstrated.

RICHARD HUDNUT, New York, N. Y. (Booth D-8), manufacturers of the famous Richard Hudnut Home Permanent and Richard Hudnut Hair Preparations and DuBarry Beauty Preparations, are displaying in an eye-catching booth the DuBarry Beauty Preparations in their attractive new packaging — streamlined and smart, yet soft and feminine! DuBarry Beauty Preparations . . . as well as the Hudnut Home Permanent and Hair Preparations . . . have the honor to be accepted for advertising in publications of the American Medical Association.

HYGEIA, THE HEALTH MAGAZINE, Chicago, Ill. (Booth A-1): Ask the booth attendant here to mail one or more free copies of HYGEIA to your home or office reception room. See the pictorial representation of a modern magazine's editorial contributors, processes of editing, methods used for accepting advertising, division of readership groups, etc. Featured are sequence-lighted color transparent photographs showing how HYGEIA "speaks" to patients, their families, and members of various professions.

THE HYGEIA NURSING BOTTLE CO., INC., Buffalo, N. Y. (Booth E-27): Here is an opportunity to see the advantages of the Hygeia Nursing Bottle units and to learn why prescribing these units will help mothers overcome feeding problems.

HYNSON, WESTCOTT & DUNNING, INC., Baltimore, Md. (Booth K-8), will feature Aluminum Penicillin Tablets and other pharmaceutical specialties of their manufacture. A series of charts illustrating the effectiveness of oral therapy with Aluminum Penicillin in a variety of penicillin susceptible diseases will be displayed. Representatives of the company will be present to demonstrate products and to provide information regarding them.

ILLE ELECTRIC CORPORATION, Long Island City, N. Y. (Booth J-11), will demonstrate how the care of infantile paralysis, arthritis, and other disabling conditions can be greatly improved by the use of Hydromassage Subaqua Therapy Tanks. They will also display an improved Mobile Whirlpool Bath with New Mobile Adjustable High Chair, Mobile Sitz Bath and new improved completely automatic temperature control Paraffin Baths.

INTERNATIONAL COLLEGE OF SURGEONS, Chicago, Ill. (Booth L-12): The exhibit of the United States Chapter, International College of Surgeons, will present graphically detailed information concerning the activities of the College in all their phases, the principles upon which the organization is founded and functions, the location of its component Chapters throughout the world, its general and educational program and the extent of its activities.

IODINE EDUCATIONAL BUREAU, INC., New York, N. Y. (Booth I-15), will emphasize the place of iodine in the fields of surgery, medicine and nutrition. Samples of official U.S.P. and N.F. preparations containing iodine, and samples of iodine preparations accepted by the Council on Pharmacy and Chemistry of the American Medical Association will be displayed. Representatives will be present to offer to physicians the Bureau's bibliographic and other services.

IVES-CAMERON COMPANY, INC., New York, N. Y. (Booth D-23): Competent Medical Service Representatives will be at this booth to answer all your questions regarding vitamins and other pharmaceutical products made by I.V.C Their eminently well qualified research staffs, through constant experimentation and study, are responsible for some of the most important advances in the field of therapy.

JANEIL SHOP FOR HANDICAPPED GIRLS, Chicago, Ill. (Booth L-11): Here will be displayed pictures of the various activities and departments of Spalding School for Handicapped Children. This Public School is one of the largest and finest of its kind in the world. A complete program of education and rehabilitation is maintained with full cooperation of physicians. Janeil Shop, a Sheltered Work Shop at Spalding School, trains badly handicapped girls to sew. Their products are sold for their benefit. The shop will have a magnificent display.

JOHNSON & JOHNSON, New Brunswick, N. J. (Booth L-17), will feature Hemo-Pak, demonstrating the latest developments in the field of hemostatic absorbable surgical dressings. The new, improved adhesive tape, perfected in the Johnson & Johnson research laboratories, will also be displayed, along with several recent additions to a complete line of surgicals.

JONES METABOLISM EQUIPMENT COMPANY, Chicago, Ill. (Booth J-9), will provide a staff of trained technicians to operate a "dry" clinic on all metabolism problems and to introduce interested visitors to the many recent developments and improvements incorporated into the Jones metabolism equipment.

"JUNKET" BRAND FOODS, Little Falls, N. Y. (Booth M-7): Essential facts on the chemistry of the rennet enzyme and the nutritional significance and psychologic value of rennet desserts in the diets of infants and adults will be explained. The enzymatic action of rennet in producing softer, finer, more readily-digestible milk curds will be illustrated. Literature giving the dietary applications of rennet products will be available for your reference.

KANSAS CITY ASSEMBLAGE CO., Kansas City, Mo. (Booth A-23), will exhibit the newly improved Padgett-Hood Dermatome, featuring an aluminum drum which gives increased lifting power, retains nearly all cement on the drum when skin is stripped from the drum, automatically aligns the knife edge with the drum surface and sets the knife edge to register with the scale. The calibrated screw-type Padgett-Hood Dermatome; Carlson Double Arm Support for kidney surgery; Wells Apparatus for intravenous anesthesia; and the Neff-Fredeen-Herrman Blood Transfusion Set, especially useful for infants and children, will also be of interest.

THE KELLEY-KOETT MFG. CO., Covington, Ky. (Booths E-28, F-27), will feature a tilting Radiographic Fluoroscopic Table with a self-rectified generator and another vertical and horizontal diagnostic unit. An interesting display of X-ray accessories and supplies will also be shown.

KELLOGG CO., Battle Creek, Mich. (Booth I-23): A Kellogg service for physicians attending the AMA Convention will include a set of special Diet Pads covering Bland, High Residue, Low Caloric, High Caloric, Salt Restricted, and Low Fat diets. A Special Diet Manual, also offered, gives suggestions for additional restricted diets indicated in certain conditions. This material has been carefully prepared following the recommendations of well-known authorities on diet in disease. Complete information concerning Kellogg cereals will be available.

KEYSTONE VIEW COMPANY, Meadville, Pa. (Booth A-21).

KIDDE MANUFACTURING CO., INC., Bloomfield, N. J. (Booth M-14), will show for the first time their newly improved Kidde Utero-tubal Insufflators with exclusive Gasometer pressure control, together with the Kidde Opaque Oil Attachment for Salpingography, etc. Some of the new improvements will include a Strip Kymograph and Flow Meter. The improved Kidde Dry Ice Apparatus with the orifice "non-clog" vent control which makes cryotherapy a practical means of treating most superficial skin lesions will also be displayed.

LAKESIDE LABORATORIES, INC., Milwaukee, Wis. (Booth E-10), exhibit will present newer methods in the treatment of cardiac failure in graphic form. Reprints of most recent literature on this subject will be available. Representatives will be on hand to discuss new methods of administering the mercurial diuretic, Mercuhydrin, and the latest developments in this field.

LaMOTTE CHEMICAL PRODUCTS CO., Baltimore, Md. (Booth B-2): For thirty years this exhibitor has been supplying physicians and clinical laboratories with simple, reliable testing sets, such as the LaMotte Blood Sugar Outfit. As new and specialized methods have been developed, LaMotte Outfits have made them available to the physician. Among the new tests exhibited this year will be a new Liver Function test; a new Blood Protein test; and the Cardiolipin Antigen for syphilis serology.

LANTEEN MEDICAL LABS., INC., Chicago, Ill. (Booth I-21): Representatives here will discuss an improved diaphragm fitting technic used in conjunction with the Lanteen Flat Spring Diaphragm.

BURNEICE LARSON, Chicago, Ill. (Booth C-22), will offer the facilities of The Medical Bureau, an organization serving as counselor in problems of medical personnel to medical schools and universities, public health organizations, hospitals and institutions, group clinics, physicians in private practice and industry. The records of Diplomates of the American Boards, younger physicians interested in obtaining training and, also, of administrators, executive and supervising nurses, scientists, laboratory technicians, x-ray technicians, social workers and dietitians will be available to those interested in the *completion or reorganization* of their staffs.

LEA & FEBIGER, Philadelphia, Pa. (Booth A-18), will exhibit such outstanding new books and new editions as Hartman and Brownell—The Adrenal Gland; Palmer—Stomach Disease as Diagnosed by Gastroscopy; Partipilo—Surgical Technique; Quiring—Collateral Circulation; Tuft—Clinical Allergy; Krimsky—Binocular Imbalance; Burch and Winsor—Electrocardiography; Lichtman—Diseases of Liver, Gallbladder and Bile Ducts; Bridges—Dietetics for the Clinician; Gray—Anatomy; Soffer—Diseases of the Adrenals; Joslin—Diabetic Manual; Kraines—Neuroses and Psychoses; Spaeth—Ophthalmic Surgery; and many other standard books of practical guidance.

LEDERLE LABORATORIES DIVISION, New York, N. Y. (Booths J-10, J-12): The Lederle exhibit will feature Aureomycin HCl, a promising new antibiotic having broad coverage against gram positive and gram negative bacteria as well as certain viral and rickettsial organisms. This antibiotic has been found to be particularly effective in virus atypical pneu*monia, brucellosis, and lymphopathia venereum.* Technical personnel will be in attendance.

CHARLES LENTZ & SONS, Philadelphia, Pa. (Booth A-9), will feature a complete line of interesting and new stainless steel instruments, both standard and special for all fields of surgery. Included also will be physicians' genuine leather bags, electric-diagnostic instruments, biological refrigerators and a new airtight circulating fan.

LIBBY, McNEILL & LIBBEY, Chicago, Ill. (Booth B-21): The advantages of Libby's Strained and Homogenized Foods will be described in the Libby, McNeill & Libby booth. Discussions pertaining to the dietary management of infants and older babies will be welcomed.

THE LIEBEL-FLARSHEIM CO., Cincinnati, Ohio (Booths E-15, F-19): The latest L-F diathermy and electrosurgical apparatus will be available for examination and demonstration. This year's June exhibit will feature the "Office Bovie," an electrosurgical unit specially designed for office use. Capable representatives will be on hand at all times. Stop by and become acquainted.

ELI LILLY AND COMPANY, Indianapolis, Ind. (Booths I-18, I-20, I-22), will center their exhibit this year around an interesting demonstration of the rapid slide flocculation test for the serodiagnosis of syphilis with Cardiolipin. Tests made with Cardiolipin have been found to be more easily performed than earlier ones, and their sensitivity is as good or better than others using a lipoid antigen. False positive reactions, although not completely avoided *by the Cardiolipin test, are materially reduced,* especially in malaria.

LINCOLN LABORATORIES, INC., Decatur, Ill. (Booth E-29), a pioneer in the development of hormone aqueous suspensions, will present their modern, all-glass ensemble for the display of a number of their leading, well-known parenteral medications, featuring Aqueous Suspension of Estrogenic Substances. Literature, favors, and professional samples will be available.

THE LINDE AIR PRODUCTS COMPANY, New York, N. Y. (Booth I-9), will feature a working model of a Linde-designed oxygen piping system, and suggestions on the conversion of a hospital room into an efficient oxygen chamber. Hints on improving oxygen tent efficiency will be presented graphically. Linde USP oxygen, oxygen therapy regulators, flowmeters, and outlet valves, and the Beckman magnetic oxygen analyzer will also be on display.

J. B. LIPPINCOTT COMPANY, Philadelphia, Pa. (Booths A-20, A-22, A-24): Look to Lippincott for timely, practical, and authoritative information—to selected professional books in all fields of medicine, surgery, nursing, and pharmacy. Here is a continual indication of current medical trends and needs which serves as the basis for new and revised clinical volumes and textbooks. Here are reports of the outstanding and significant work being done in general practice, as well as the specialties, by men making very real contributions to medical progress.

THE LOFSTRAND COMPANY, Rockville, Md. (Booth B-4, E½): The Lofstrand Company will present *the latest* research developments in prefabricated leg brace parts. These parts are quickly and easily assembled into various types of lightweight aluminum leg braces. Also featuring: proper physiological fit by employing multi-pivot knee locks—interchangeable stirrups—excellent wearability—beautiful permanent alumilite finish. The newly expanded line of Lofstrand Featherweight Crutches will also be presented.

P. LORILLARD CO., INC., New York, N. Y. (Booths G-26, G-28): The exhibit by the makers of Old Gold Cigarettes is symbolic of the company's manufacturing policy which has been to retain all that is best in traditional methods and combine these with the best that Twentieth Century science affords. The booth is manufactured of the newest of plastics, plywood, and illuminated with indirect florescent light. *The central feature is a lighted map* showing the extent of Lorillard's manufacturing and sales facilities.

LUZIER'S, INC., Kansas City, Mo. (Booth G-17): A complete display of Luzier's Fine Cosmetics and Perfumes will be attractively displayed here. These beauty aids will be of special interest to dermatologists and allergists, as well as to the ladies who visit the Convention. Officials of Luzier's Inc. will be on hand to explain Luzier's Service in the field of allergy.

M & R DIETETIC LABORATORIES, INC., Columbus, Ohio (Booths E-14, E-16): Representatives here will be pleased to discuss the merits of Similac, a food for infants deprived of breast milk, and to suggest its application for both the normal and special feeding case.

MACALASTER BICKNELL CO., Cambridge, Mass. (Booth B-30, W½): Fenwal equipment for the manufacture of intravenous fluids within the hospital; equipment for the collection of whole blood, processing of plasma and dispensing of blood and plasma; and a unique seal for handling surgical fluids in the operating room and about the hospital will spotlight this exhibit.

MACHLETT LABORATORIES, INCORPORATED, Springdale, Conn. (Booth F-4), will display a complete line of x-ray tubes, including rotating and stationary types for radiographic work and an unusually wide range of therapy tubes. The featured items in the radiographic field will be the Machlett 125 KV high-energy rotating anode tube (Super-Dynamax) and a special rotating anode tube (Dynamax "26") for fluoroscopy and spot-film work. In the *therapy field* will be shown the new Aeromax "18" for operation at 135 KV. (A version of this tube is offered for radiography up to 125 KV.) The Machlett OEG-50 beryllium window tube, operating at 50 KVP makes available the higest intensity soft x-rays.

THE MACMILLAN COMPANY, New York, N. Y. (Booth H-21): Prominent works awaiting your examination here include: Dr. Thomas Addis' Glomerular Nephritis, wholeheartedly accepted by practitioners; (the initial printing was exhausted late in 1948, and the book is now in the reprint stage. It is a challenging and thought provoking monograph); the new book, Syphilis: Its Course and Management, by Evan W. Thomas, M.D., of particular significance because of the attention being paid this new method of treatment at the present time (The experience of Dr. Thomas and his associates is of primary interest to the practicing physician); Reich's Diseases of the Aorta; and Burstein's Fundamental Considerations in Anesthesia (both in press). A new study in the radiological diagnosis of bone and joint diseases, authored by Emerik L. Markovits, M.D., is also being prepared by the publisher.

THE MAICO COMPANY, INC., Minneapolis, Minn. (Booth C-3), is exhibiting the famous Maico audiometers, the Maico Atomeer, all-in-one hearing aid, and the Maico Stethetron, an electronic device for selecting and amplifying the heart and respiratory sounds. AMA members will be interested in seeing the newest developments from the Maico laboratories which have contributed so much to the field of medical acoustics.

MALLINCKRODT CHEMICAL WORKS, St. Louis, Mo. (Booth E-32): Representatives in attendance here will be glad to serve you in answering questions concerning the medical chemicals on display, or any other problems relative to the medicinal line of chemicals as supplied by the Mallinckrodt Chemical Works.

THE MALTINE COMPANY, Morris Plains, N. J. (Booth H-12): Demonstrations of the approved methods for determining prothrombin time feature the Maltine exhibit. Research personnel and professional representatives will be available to discuss anticoagulant therapy and the new stable Thromboplastin-Maltine.

MANHATTAN UNIFORM CO., Chicago, Ill. (Booth K-1), along with many other styles, will feature the style with round neck and action back, this model allows more room in back without affecting its neat professional appearance and may be worn over or without a shirt and tie. The same style in high collar will also be offered. Many styles of Nurses uniforms besides the new 2-piece outfit will be on display.

MARCELLE COSMETICS, INC., Chicago, Ill. (Booth H-18): New developments and new products in the Marcelle hypo-allergenic Cosmetic line will be demonstrated at their attractive exhibit. Among these will be the Foundation Lotion for Oily Skin and the Foundation Lotion for Dry and Normal Skin. The Foundation Lotion for Oily Skin has found great utility as a flesh tinted astringent vehicle into which medication can be incorporated; the Foundation Lotion for Dry and Normal Skin, as an outstanding camouflage for cutaneous blemishes. The Marcelle representatives will include members of their research organization who will have data and information on the role of Marcelle hypo-allergenic cosmetics in the physician's practice.

THE S. E. MASSENGILL COMPANY, Bristol, Tenn. (Booth L-9): An interesting display is planned to inform the physician of the ever-growing number of Massengill Council-Accepted products. These preparations are basic in that they are applicable in everyday practice.

F. MATTERN MFG. COMPANY, Chicago, Ill. (Booths F-1, F-2, G-1, G-2): Make a "must-see" stop on your Convention tour at the Mattern exhibit and examine the fine *low-priced* X-Ray equipment shown. Mattern is the originator of the push button control on X-Ray units and is considered one of the leaders in introducing the latest in new designs. Your personal examination of this useful equipment is invited.

McFEDRIES X-RAY CO., Chicago, Ill., (Booth K-32), will be exhibiting their new 100-100 Ball-Mounted *Radiographic-Fluoroscopic* Unit with Electric Shutters and Hand Tilt Table. This unit offers the doctor both horizontal and vertical fluoroscopy as well as radiography. The Table and Bucky are carefully counterweighted to facilitate ease of operation. The finish is grey hammertone and the price attractive.

McGRAW-HILL BOOK COMPANY, INC., New York, N. Y. (Booth I-6): Advance material on three distinguished new McGraw-Hill books will be available for examination at the McGraw-Hill Book Company exhibit: Mental Hygiene in Public Health, By Paul V. Lemkau, M.D., a study of the relation between public health and mental hygiene; Epilepsy nad Convulsive Disorders in Children, By Edward M. Bridge, M.D., the clinical aspects and practical management of epilepsy; and Clinical Electroencephalography, By Robert Cohn, M.D., a manual for interpretation of electroencephalograms.

McKESSON APPLIANCE COMPANY, Toledo, Ohio (Booth M-11), will show the latest developments in anesthesia equipment, as well as items of interest to office and clinical personnel. Parts catalogs will be available, as will technicians to help you solve your service problems. Your visit of inspection will be welcomed.

McKESSON & ROBBINS, INC., New York, N. Y. (Booth D-15): A display of Council-Accepted vitamin products and Tartan Suntan Lotion will be made, along with laboratory demonstrations of the technique of instrumental vitamin assays and the evaluation of Tartan showing its high degree of effectiveness in selectively absorbing certain ultraviolet radiations and the transmission of those desirable for tanning.

D. C. MCLINTOCK CO. INC., Hackensack, N. J. (Booth C-19): Doctors will want to visit this booth and inspect the fine products of A. de St. Dalmas Co., Ltd. of Leicester, England on display. Founded in 1823, this firm has won recognition for the fine quality of its bandages and dressings. The Dalzoflex outer adhesive elastic bandage is flesh colored and when used in combination with the "Primer Bandage" is advantageous in pressure-bandage therapy.

McNEIL LABORATORIES, INC., Philadelphia, Pa. (Booths G-13, 15).

MEAD JOHNSON & COMPANY, Evansville, Ind. (Booths A-6, A-8, F-14, F-16): Amigen and Protolysate will be on display at the Mead Johnson Exhibit. Mead Johnson has pioneered the amino acid field commercially; and the products have been described in more than four hundred articles in the medical literature. Trained representatives will be at the Mead exhibit to discuss details of the new amino acid products. Shown also will be Dextri-Maltose, Pablum, Pabena, Oleum Percomorphum, and the other Mead Products used in Infant Nutrition.

MEDCRAFT ELECTRONICS CORP., Long Island City, N. Y. (Booth M-30, E½).

MEDICAL CASE HISTORY BUREAU, New York, N. Y. (Booth F-20): A handy, compact method for keeping complete case histories will be the feature here. In the Info-Dex Record System, charts are so arranged on folders that subsequent cards may be attached by means of a cotter pin which holds the cards together in correct sequence and prevents loss or detachment. Different colored cards for various types of data such as laboratory, x-ray findings, etc. are obtainable. Included in this system is an automatic diagnostic cross-indexing. Steel filing cabinets in which to house these history charts and bookkeeping records will also be displayed. Representatives at the exhibit will gladly consult with you on any record problem or help you systematize your office routine.

MEDICAL FILM GUILD, New York, N. Y. (S. E. Movie Room), through Medical Films that teach, will present a refresher course in fundamental medical problems. Each film subject is produced in the manner of a textbook, profusely illustrated, and offering information comparable to that found in post-graduate courses. These films are available at no charge to intern groups, hospital staff conferences, limited nurse groups, and to general medical meetings. This includes free projection service, arranged through grants for postgraduate instruction.

MEDICAL INSTRUMENTS & EQUIPMENT CO., Stillwater, Okla. (Booth EP-5).

MEDICAL·MAILING SERVICE, INC., Chicago, Ill. (Booth K-5): Physicians desiring to mail reprints to their colleagues may secure complete, detailed information including counts and prices for addressing and mailing to any select group of physicians in the United States and Canada. Many physicians and pharmaceutical manufacturers use this service. Medical Mailing Service has more than twenty years experience in handling this work. Exhibitors are also invited to call and discuss their direct mail campaigns.

MEDICAL PROTECTIVE COMPANY, Fort Wayne, Ind. (Booth J-19): Fifty years of service to the medical profession is commemorated here. A visit to the booth will acquaint you with the Specialized Service Plan of this firm which has concentrated its efforts on the legal liability problems of the profession for fifty years.

THE MENNEN COMPANY, Newark, N. J. (Booth I-17): The center of interest at the Mennen exhibit will be their two baby products —Mennen Baby Oil and Mennen Baby Powder. The Baby Oil is now being used routinely by the majority of hospitals that are important in maternity work.

MERCK & CO., INC., Rahway, N. J. (Booths H-14, 16), will have an interesting presentation of pure vitamin B_{12}. The history of its gradual purification over a number of years and the preliminary chemical studies of this highly potent compound will be depicted. Other panels will show pharmacology (animal growth) and therapy, emphasizing the treatment of pernicious anemia, including not only the blood response but also neurological and mucous membrane improvement.

THE WM. S. MERRELL COMPANY, Cincinnati, Ohio (Booth I-26), will feature Diothane Ointment with Oxyquinoline Benzoate, an improved preparation for applying an anesthetic to areas that require prolonged contact, and where it is desirable to provide a protective antiseptic coating. Of relatively low toxicity, Diothane Ointment with Oxyquinoline Benzoate has established a reputation for safety in clinical use.

METRO-TEC, Chicago, Ill. (Booth E-6), will display the Schindler Flexible Gastroscope featuring the new Metro-coated lens system. Every lens is covered with a special chemical coating increasing the brilliance of the illumination by one third. This gastroscope also provides the preferred fingertip light control at Off-8V-10V-12V-15V position by simply sliding a button incorporated in the handle. Stop in for a demonstration.

THE WM. MEYER COMPANY, Chicago, Ill. (Booth F-10), who have been actively engaged in the production of quality x-ray equipment since 1904, will as usual exhibit several popular medical x-ray units. They anticipate introducing something doctors have all been waiting for and extend a cordial invitation to pay them a visit during the meeting.

E. B. MEYROWITZ SURGICAL INSTRUMENTS CO., INC., New York, N. Y. (Booth D-26), will headline ophthalmological apparatus and eye, ear, nose, and throat instruments. Specialties will include: Corneal transplant instruments; Hertel Exophthalmometer; Troncoso Gonioscope; Schiotz and McLean Tonometers: French and German scissors, forceps and punches; Binocular Loupes; Wolf Mouth Gag; and English Antrum Syringe.

MICROTONE COMPANY, St. Paul, Minn. (Booth EP-2).

MILLER SURGICAL COMPANY, Chicago, Ill. (Booth WP-5).

MINE SAFETY APPLIANCES CO., Pittsburgh, Pa. (Booth C-12), will feature the new MSA Pneophore which utilizes intermittent positive pressure to restore breathing asphyxia and permits the most advanced technique in inhalational therapy. In addition to the Pneophore's use in respiratory emergencies to assist in the prevention of asphyxial death, the instrument is applied in cases of poliomyelitis with respiratory arrest, pulmonary edema from exposure to irritant gases, super-heated air, or other causes, etc.

THE C. V. MOSBY CO., St. Louis, Mo. (Booths C-14, C-16): A wealth of new and interesting material will attract visitors to the Mosby booth. A few of the recent releases include: Speed-Campbell, Operative Orthopedics; Sutton, Handbook of Diseases of the Skin; Slocum, An Atlas of Amputations; Merrill-Picker, Atlas of Roentgenographic Positions; Davison, Handbook of Materia Medica, Toxicology and Pharmacology; Kantor-Kasich, Handbook of Digestive Diseases; and many others.

MOTHERS' AID AUXILIARY CHICAGO LYING-IN HOSPITAL (Booth L-17), publishers of Our Baby's First Seven Years Record Book and Scrapbook, invites doctors to see and order Layette Sheets for Maternity Patients and Measurettes for Pediatricians. These attractive pieces are free and shipped without charge. The sale of books benefits research at Chicago Lying-In Hospital.

V. MUELLER & CO., Chicago, Ill. (Booth H-10): An interesting selection of new instruments for all branches of surgery will form a large part of the V. Mueller exhibit, which will also feature many fine instruments of pre-war quality that are now available. A new explosion-proof surgical unit will also be shown for the first time, highlighting a display of some of the most modern surgical equipment.

NATIONAL ASSOCIATION OF MARGARINE MANUFACTURERS, Washington, D. C. (Booth K-28): Information on margarine, its ingredients and manufacture, and its role in sound nutrition, may be found in Booth K-28. The National Association of Margarine Manufacturers invites your questions and views on the place of margarine in the diet. Current margarine literature and taste samples of margarine are available gratis.

NATIONAL DAIRY COUNCIL, Chicago, Ill. (Booth F-5): "Dairy Products Complete Your Daily Meals" is the theme of the colorful display to be shown by the National Dairy Council. Full color photographs of three daily meals, with and without Dairy products, dramatize, with colorful charts, the importance of dairy products to nutritionally adequate meals. Portfolios of the latest Dairy Council material are also on display at the booth.

NATIONAL DAIRY PRODUCTS CO., INC., New York, N. Y. (Booth C-27), will devote their exhibit to Formulac an Infant Food which has in a comparative few years become an outstanding product for the feeding of newborns through the formula period and continued as the baby drinks from the cup. The medical profession from coast to coast. graciously accepted "Formulac" right from the day it was first introduced.

THE NATIONAL DRUG COMPANY, Philadelphia, Pa. (Booth L-14): Their extensive line of Council-Accepted biological, biochemical, and pharmaceutical products attests to the emphasis placed upon high standards by this firm. Trained representatives will be on hand to welcome you and supply you with any descriptive literature you may wish, or answer any questions you may have pertaining to the uses, dosage, and administration of "National Drugs."

NATIONAL ELECTRIC INSTRUMENT CO., INC., Elmhurst, N. Y. (Booth M-22): A number of new and interesting items which will invite your special attention include: the Electricator, for simple, effective minor electrosurgery; the Nasopharyngoscope 5070, possessed of many advantages; the latest "National" development—the Operating and Double-catheterizing Cystoscope 21 Fr.; and the still refreshingly new Quad-disc Ophthalmoscope. Visitors will also be impressed by a number of important improvements in the Diagnostic Sets.

NATIONAL INSTITUTE OF DIAPER SERVICES, INC., New York, N. Y. (Booth C-1): It does make a difference what diaper service a doctor recommends, says the NIDS whose members now serve 150 metropolitan areas. These members are the only diaper services operating under compulsory national laboratory control, which assures physicians that the diapers are "safe." Look for the new NIDS display at their booth and ask for a bank to take home to the kiddies.

NATIONAL LIVE STOCK AND MEAT BOARD, Chicago, Ill. (Booth J-14): Weight Control by means of a well planned adequate diet is the theme of the nutrition exhibit of the National Live Stock and Meat Board. The value of a liberal amount of meat in the maintenance of normal weight is emphasized. Literature on this subject and on general nutrition will be available.

THOMAS NELSON & SONS, New York, N. Y. (Booth D-11), will feature The Nelson Medicine, a loose leaf system, edited by Dr. Walter W. Palmer; Diagnostic Roentgenology, edited by Dr. Ross Golden; Surgery of the Ear, edited by Dr. Samuel J. Kopetzky; Surgery of the Nose and Throat, edited by Dr. John D. Kernan. In addition, Nelson will show three of their new line of bound books: Virus Diseases of Man by Drs. C. E. van Rooyen and A. J. Rhodes; Deafness, Tinnitus, and Vertigo by Dr. Samuel J. Kopetzky; and a completely revised, new, bound edition of Medicine of the Ear edited by Dr. Edmund P. Fowler, Jr. Prepublication information on Gynecologic Diagnosis, by Dr. Robert Tauber, may be had at the exhibit.

THE NESTLÉ CO., INC., New York, N. Y. (Booth H-23): For your relaxation, The Nestle Company cordially invites you to enjoy a hot cup of delicious Nescafe. And, for your information, specially qualified representatives will be on hand to answer your questions on any of Nestle's milk products—already known and used for babies 'round the world. New pieces of valuable professional literature will be available.

THE NEW YORK MEDICAL EXCHANGE, New York, N. Y. (Booth H-20): Patricia Edgerly will be in Booth H-20 for the sole purpose of helping you, whether your problem be to find the best man or the best opening. Her successful experience in serving the medical field exclusively since 1926 is the best assurance that she can help you. Stop by and chat with her.

NORTH AMERICAN PHILIPS CO., Mt. Vernon, N. Y. (Booths M-3, M-5), will display a new combination radiographic-fluoroscopic unit in two executions; namely 15 and 30 MA capacities. For the first time, their Okalix Dental Unit—a new, cleverly engineered development will be exhibited. This self-contained unit is probably the smallest yet developed and has an effective focus of approximately 0.5 mm. Their new X-ray rotating anode tube—Rotalix—for which Philips has long been famous, will also be shown.

OBRIG LABORATORIES, INC., New York, N. Y. (Booth M-1): The new Obrig Lacrilens made from molds will be shown for the first time. *This new contact lens, say the producers*, is solutionless, medically correct, and safe. The patient's tears form the necessary fluid lens, thereby eliminating difficulties caused by artificial buffer solutions. The new lens can be worn over long continuous periods with comfort.

THE OHIO CHEMI [illegible] Wis. (Booth E-4), [illegible] gases; Heidbrink [illegible] tables, sutures; and [illegible] *The new* Sterijar suture glass container will also be displayed.

LYDIA O'LEARY, INC., New York, N. Y. (Booth K-31): Visit the Lydia O'Leary exhibit and witness the Covermark demonstration. *Covermark is especially prepared for the instant* concealment of all types of blemishes involving *the pigment of the skin, including Birthmarks*, Goiter Scars, Burns, Vitiligo, Psoriasis, and all skin discolorations. Covermark has been found particularly successful in overcoming the psychological handicaps which result from even minor facial blemishes.

ORGANON, INC., Orange, N. J. (Booth I-29, E½): Heparin—the body's natural anticoagulant—will be the subject about which the Organon exhibit will be centered. Subcutaneous injection and other new methods of administering Liquaemin—the Organon brand of heparin—will be described. Newer concepts of the mechanism of blood coagulation, showing sites of heparin action, will be illustrated together with a machine actually demonstrating the anticoa [illegible] the blood. Doca [illegible] acetate), another [illegible] oduct, will also be featured.
